Wonca
World family doctors. Caring for people
EUROPE

ABSTRACT BOOK

WELCOME MESSAGES

Dear Colleagues,

We are proud to celebrate 20th anniversary of Wonca Europe and 25th anniversary of TAHUD, Turkish Association of Family Physicians. We hope to continue the success of previous congresses and carry out that success to the next congress.

The idea of choosing the theme “Being Young Staying Young” was to look through past and to look ahead when we were leaving behind the twenty years as Wonca Europe and twenty five years as TAHUD.

The years ending with zero and five have been accepted as evaluation and planning years. For this reason we aimed to place sessions to discuss the future perspectives of Wonca Europe on education, clinical practice, organization of family physicians, when we were forming the congress program.

We wanted to ensure to provide wide variety of opinions to be presented on such important issues. That’s how the “Grand Sessions” created. With the aim of increasing the number of plenary sessions beyond the keynote sessions, and capturing the opportunity to listen more doyens and experts, five grand session time slots have been created at the congress while there were 21 paralel sessions in other slots.

With the motto “Being Young Staying Young” meaning dynamism for our disicpline, our aim was not only to make the experts to be heard but also to give the chance to each participant who wish to share and exchange their own experiences thus to ensure a more colorful and broad participation congress and increase attendance of young doctors.

With this aim we have created nineteen BRITE sessions. BRITE sessions aim to provide family doctors to share their ideas by discussing the positive and negative consequences of their practices. We think these sessions will motivate reflective learning by encouraging the physicians to review their practice and also will contribute to the identification of new research areas.

The participants of Pre Conference organized by VdGM has increased seventy percent. On the other hand one third of the participants attending to the congress are young family doctors. In this congress, for the first time, we have made all leaders of Young Doctors’ Movement of Wonca to come together in Istanbul.

Our congress is colorful in terms of content and it has a green philosophy. For this purpose, we avoided to print papers as much as possible. We have saved at least 1,500 trees when we calculate only our monthly emails. More than this we contributed developments of forest by creating Wonca Europe Memorial Forest.

We are also proud of giving new opportunities to the participants who “stays young”. Participants of the congress who wishes to observe the primary care in Turkey closely, and to have new friends, are hosted by Turkish colleagues before the congress within the HostPro program.

Istanbul is a magnificent city in the heart of Europe and Asia. We advice you to see beauty of the city. We have decided to make 20th year celebration at a private boat on Bosphorous particularly. We hope you to have splendid time with beautiful Istanbul panorama.

We would like to thank Wonca Europe president Job FM Metsemakers and the liason person Anna Stavdal, other members of Wonca Europe Executive Committee and International Advisory Board for their supports and contributions. We are also grateful to Micheal Kidd, Wonca World President, and to all people who made this congress real.

Hoping to have a successful congress.

KEYNOTE LECTURE

The tree bends when it is young - The value of flexibility and adaptability for the development of family medicine

Amada Howe is a professor of Primary Care in University of East Anglia, she was former honorary secretary Royal College of General Practitioners, currently she is Vice Chair Council (Professional Development Portfolio) in the same organization. She is also President Elect Wonca.

Honoured hosts, dear colleagues and friends,

It is a great privilege to be a keynote speaker for the 2015 WONCA EUROPE Conference in Istanbul. My talk will relate to the conference theme, and my title "Ağaç yaş iken eğilir" ('Trees bend when they are young') reflects my intention to discuss the cycle of growth for both our discipline and our organisations - and to evaluate the strengths of being young and growing older!

I have had two reasons to reflect on what it means to be young, or stay young. The first is personal - I have recently had my 60th birthday, and also become a grandmother for the first time. The return to having significant responsibility for a very young child, and remembering the very basic demands of parenting, provides me with a life experience that is very different from that of caring for patients, or chairing medical school committees, or meeting senior colleagues across the world for major scientific and policy discussions. It is an unconditional commitment, with little glamour or intellectual output, but huge emotional demands and rewards. It also heralds a new cycle of life – one where one is reminded of the fragility of health and wellbeing. And it brings more experience of the patient perspective – our essential reliance on the health providers getting it right – in the clinic, in the hospital, and at all stages of care.

How has this helped me to think about our discipline of family medicine, and our careers as family doctors? I can look back at my own career and see different phases - the contribution of my family background, school and university opportunities; then choosing family medicine, entering clinical practice, and an unexpected transition into academic, national and international roles.

I know that for many young doctors, it is often daunting to think about how to make appropriate career choices – especially where to work, how much work to do, how to balance clinical work with other interests and commitments such as child rearing, and indeed how to choose a speciality. Our discipline is also young in global terms, and often this adds insecurity – we may have to defend our status, the value of our discipline, the quality of our service, and fight for the resources we need to do a good job. We also have to increase the both the public's and politicians' understanding of the added value of family medicine as a speciality in the health system. So being young, whether personally or professionally, can be an uncomfortable and uncertain time, with added risks and anxieties. I shall include some factors in my talk which can help to guide us through these early stages.

The second reason I have been thinking about 'growing up' is related to my deepening understanding of WONCA, its history and different organisational parts. The lens of history is one which can magnify our understanding of who we are and why we act as we do – just as family doctors often need to understand what motivates our patients to use health care and live healthily, we need to understand our own strengths and weaknesses.

If we look back at WONCA's inaugural meeting, the key ingredients were a core group of committed people with a vision, building on their own experiences and others to create a professional organisation. They worked hard to define and deliver the new organisation, using conventional modes of creating a professional governance and representational structure. Wes Fabb, in his report of the inaugural conference, noted that what had been achieved could not yet be measured in finite terms, but would worldwide add to the quality of care people received from their family doctors.

One of the striking aspects of the history of WONCA, and this remains true today, is the longstanding commitment of many of its leaders in what essentially is a voluntary capacity. Wes Fabb, for example, was involved from 1972, and was CEO for twenty years. Our President, Michael Kidd, mentions in his obituary message to David Game (who was President, and also WONCA Editor for 28 years) that Michael was already attending WONCA Conferences in 1990 – 25 years ago. I myself can therefore only count as a relatively young activist within WONCA, attending my first European conference in the late 1990s, joining a working party in 2001, and my first world conference in Orlando in 2004. But many have joined after me – we have seen huge increases in the numbers of member organisations, and of young doctors getting involved in their regional movements - and more are welcome! We hope that WONCA in all its forms – national, regional, working parties and special interest groups – will offer our members a scope which will enhance their professional development over many years to come.

We welcome the growth and activities of our members – and at the same time, it presents challenges. With bigger aims, more members, and more activities come new demands; but our Secretariat globally is still only 4 people. In Singapore we had 3 staff, Wes and Marian ran this on 1.5 people – 4 still seems very small for the work we are now doing. The regional groupings also struggle with capacity, and to me this is a bit like a young forest growing on a hill side – we have great strength in our roots but the ground under us could slide away. So there are some conditions we need to fulfil for organizational resilience which I will outline – these include sustainable financing; strong but flexible governance; streamlining bureaucracy; capacity building; being effective politically; being flexible, inclusive and open; making strong political alliances which promote our mission and its impacts; having evidence to support our work; and delivering on our promises.. We have to be effective at both doing our jobs well and collecting data to prove our effectiveness – or to identify areas where we could do better if further resourced.

The final part of my talk will be about staying young – how to stay fresh in spite of the demands of work, home, long-term relationships, and the varying challenges of professional and political environments. In Prague in 2013 I spoke about factors which assist doctors to be resilient – this includes keeping ourselves educationally up to date, making good relationships with patients and colleagues, knowing how to get support when needed, and making sure that over time we have different career opportunities which develop new skills and enthusiasms. WONCA has a role in helping with your resilience, and therefore keeping you ‘young’ as a professional – we provide support networks, new information and ideas, and a peer group with shared values. We also work on your behalf - we try to make persistent and committed efforts to improve the external status of family medicine, and so to make your own experience as family doctors more meaningful. My final slides will give some early views about the programmes of work that I aim to pursue with you over the next period of time.

KEYNOTE LECTURE

Role of Academia, Science, Ethics and Mentor for the Future of Medicine

Prof. Emin Kansu is a professor of hematology and chairman at basic oncology department of Hacettepe University in Ankara, Turkey. He has been member of European Union and Europe Scientific Committee Ethics Working Groups. He is a member of Turkish Scientific and Technical Research Council (TUBITAK) and Scientific Research Ethics Committee.

University is an educational institution designed for instruction, examination, or both, of students in many branches of advanced learning, conferring degrees in various faculties, and often embodying colleges and similar institutions. Its vision should include to achieve the highest levels of distinction in discovery and dissemination of knowledge in the education of students.

Also an academic institution should attain the highest possible level of achievement in education and prepare them for positions of leadership and service. It will also give priority to research and teaching of its faculty with its distinctive emphasis on excellence in undergraduate and postgraduate education as well as service to society. During the university training, each student has to learn science, how to reach the scientific truth, to ask right questions at right time and to find the correct answers to his or her questions. Students are expected to acquire analytical and creative thinking leading to novel ideas.

In academia, scientific leaders are mentors and they help to build the mentee's career. This mentor-mentee relationship forms the basis of an academic microenvironment. Academic microenvironment is an interactive environment in which a mentee can greatly benefit and receive a learning experience. A mentor should recognize the mentee's potential abilities and encourages him/her. A good mentor should set reachable standards, goals and expectations for the mentee. A mentor should be supportive, "good listener" and a "good communicator". Mentor – mentee relationship usually includes mutual interests in area of study. If this becomes a productive scientific relationship it will eventually promote professional excellence and growth. All mentors should be honest and teach their mentee's ethical standards in research and publication. The perfect mentor/mentee relationship is an essential aspect of future of medicine.

KEYNOTE LECTURE

What changes in the role of family physicians and general practitioners?

Jan De Maeseneer is professor and head of department of family medicine and primary health care, Ghent University.

Family physician community health center "Botermarkt", Ledeborg – Gent, Belgium.
Chairman European Forum for Primary Care.

1. Introduction: The changing society.

Nowadays, general practitioners and family physicians are confronted with a very rapidly changing environment. First of all, there are the epidemiological and demographical transitions: from acute conditions towards chronic disorders, with an increasing amount of people with multi-morbidity¹. Another important evolution is the scientific and technological innovation (e.g. ICT), that creates opportunities to bring technology that was formerly not available in primary care in the hand of family physicians. Unfortunately, we are confronted in the daily practice for primary care with an increasing social gradient in health, with as a consequence e.g. in a country like Belgium, a gap of 18 years in healthy life expectancy for men at the age of 25, depending on whether they had only basic education, or a university or a school for higher education degree. Probably the most "disruptive innovation" in the last decade, has been the changing position of the patient, who becomes more and more an informed actor in the health care process. Finally, nowadays, and increasingly due to migration of refugees for war and insecurity, the population we serve is more and more diverse, multi-cultural, and so health care becomes more and more "global".

These challenges require a change in the role of general practitioner/family physicians, but also in the way the profession organizes its practice. Society expects primary care providers to contribute to the "triple aim": better care, more health and more value (i.e. the relation between quality and cost)². We will now describe the changes in roles of family physicians and general practitioners at the nano-, micro-, meso- and macro-level.

2. The Nano-level.

This is the level of the concrete interaction between a person looking for care and a provider. At this level, to a large extent, the experience of "quality" will be assessed by the person looking for care. Person-centered approach as defined in the "World Health Support: Primary Health Care: now more than ever!³. Nowadays the family physician does no more work as a single-handed practitioner, but will work in team, acting as an "integrator" of the care process: exploring new complaints and problems, taking care for appropriate support of chronic conditions, empowering the patient and shifting the paradigm from problem-oriented care, towards goal-oriented care, taking the goals of the patient as the ultimate point of reference for the care processes⁴. At the nano-level, increasingly, electronic devices will be used in order to capture information from the patient. The challenge will be to avoid a "digital device" and to find an appropriate balance between "compassion" and "computer".

3. The Micro-level.

The Micro-level is where a team, working in a practice organizes the care for a (defined) community. At this level appropriate sharing of information, through the Electronic Patient Record (with actions for the patient and for all the care providers, taking into account privacy-issues), is the cornerstone of a comprehensive approach. Increasingly, it will be needed to agree on appropriate coding and classification of the information. Both the International Classification of Primary Care (ICPC-2) and the "International Classification of Function" (ICF), will be needed in order to classify appropriately the (multiple) conditions of a patient. A contextual approach will require cooperation with care providers from other sectors e.g. social workers. In complex situations, the patient may choose one of his/her care providers as a "case-manager" to coordinate the care in continuous interaction with the patient. Increasingly, the practices active at the micro-level will work together through networks in order to share expertise and improve access. Patients appreciate very much the opportunity to choose (1 or 2) "preferred providers" in order to enhance "personal continuity".

The information available in the "Electronic Patient Record" may not only be used for individual care, but may contribute to an analysis of the problems a community is facing. This can happen in the framework of

"Community Oriented Primary Care", where primary care providers, together with the community identify problems, formulate a "Community Diagnosis" and develop interventions in order to address the "upstream causes" of ill-health⁵. An important focus in these interventions will be the contribution to more "social cohesion" in order to improve the health status of the population.

Increasingly, the model of Interprofessional Community Health Centers is developed. In general, these interprofessional practices comprise family physicians/general practitioners, nurses, social workers, occupational therapists, dentists, health promoters, physiotherapists, nurses, midwives,... The team takes responsibility for the care for a defined population. Cooperation may be stimulated by the use of a "Needs-based integrated mixed capitation", as e.g. is the case in the Belgian Community Health Centers.

4. The Meso-level.

The different practices at the primary care level, also when they work together in networks, are not able to provide the organizational power that is needed to make a strong primary care system. Therefore, organization at the meso-level is needed. Internationally, a meso-level is quite often defined as a geographic area, with 75.000 up to 125.000 inhabitants. At this level primary care may realize continuity functions (GP-posts for out-of-hours care,...), support services e.g. palliative home care,... And this may also be the level where the providers interact and negotiate with the local authorities. It is also at this level that primary care providers and especially family physicians/ general practitioners may take up an "advocacy role" giving a voice to those who do not have a voice in society (the poor, disabled, illiterate, undocumented,...). More and more tasks will shift from hospital to primary care, it will be important to strengthen the meso-level, in order to increase the performance of the primary health care system.

5. The Macro-level.

This is the level where policy-decisions are taken. Nowadays, there is a lot of rhetoric by politicians, explaining why it is so important to strengthen the primary care. On the other hand, it is quite difficult to shift resources from secondary to primary care, when components of the care are no longer dealt with in hospitals, but at the primary care level. The principle "the money follows the patient" is simple, the practice is tough. In Europe, still a lot of countries do not have a full patient list system, neither they have the regulations in order to enable appropriate referral and "gate-keeping"⁶.

As far as financing is concerned, primary care, should basically be financed through a "population-oriented" mechanism, whereas in secondary care a "disease-oriented" financing mechanism is used. Strong organizations or family physicians/general practitioners, if possible in interprofessional cooperation, are needed in order to translate the scientific evidence into concrete policy actions.

6. What does this mean for the family physician/general practitioner?

This transition will not only require the acquisition of new skills (Collaborative Leadership, Comprehensive Data-Analysis, understanding of policy development), but also a new type of organization of the practice, using interprofessional networks that engage in Intersectoral Action for Health. These networks will ask for new organizational approaches: replacing the traditional bureaucratic "Command-and-Control"-approach by a "Complex Adaptive Systems"-approach⁷. In order to be able to perform all these tasks in a sustainable way, the family physician/general practitioner will become a "reflective practitioner" who takes care of the personal health and of the wellbeing of the team of care providers. By doing so, family physicians/general practitioners are ready to contribute to the "Sustainable Development Goals" 2015-2030.

CON-001

Stroke prevention in AF - state of the science

Richard Hobbs

University of Oxford

BACKGROUND: Atrial fibrillation (AF) is the commonest cardiac arrhythmia, and is associated with high risk of embolic stroke (cause in 15% of strokes), which anticoagulation will reduce by about two-thirds. To have a public health impact, patients with AF needs efficient and correct identification, with appropriate treatment directed at those at most risk of stroke.

The evidence: The prevalence of AF (UK primary care) is 1.7% in a randomly sampled population of those over 45, ranging from 1% in the 55-64 year olds, 1.5% in ages 65-74, 8% in ages 76-84, and 12% over 85. AF stroke prevention trials show that anticoagulation with warfarin is significantly more effective than aspirin in prevention of stroke in atrial fibrillation (AF), particularly in those over the age of 75. Studies based in primary care have recently validated the best screening strategies for AF. A range of newer anticoagulants are now available (direct thrombin II inhibitors and Factor Xa inhibitors) which do not require any INR monitoring, and are at least as effective and probably safer than warfarin.

Implications: Despite the strong evidence base on who to treat and how, patients at risk are currently under-treated in terms of both initiation of anticoagulation and INR control if treated.

Keywords: atrial fibrillation, stroke, risk, anticoagulation

CON-002

Quaternary prevention: the basis for its operationalization in the doctor-patient relationship

Armando Henrique Norman¹, Charles Dalcanale Tesser²

¹Durham University, Anthropology Department, UK

²Federal University of Santa Catarina, Public Health Department, Brazil

The quaternary prevention (P4) concept is gaining prominence since its official inclusion in WONCA dictionary in 2003. The current debate over the Evidenced-based Medicine (EBM) paradigm, depicted as movement in crises in the BMJ, has increased the doctors' responsibility in the face of greater uncertainty due to a lack transparency in the research protocols, participant bias selection, and publication bias and so on. Thus, our aim is to present the clinical and conceptual basis to operationalize quaternary prevention in primary health care services and teaching contexts and/or residency programmes in family medicine. The enhanced Calgary-Cambridge model of medical consultation is used as an organizational matrix to insert quaternary prevention in two moments: diagnosis and care plan. To strengthen quaternary prevention in these two consultation moments, the discussion explores: a) conceptual disease axes (pathological, physiopathological, semiological and epidemiological); b) illness explanatory approaches (ontological and dynamic); and c) suffering in relation to time (present and future), differentiating present lived suffering from concerns about future health. We conclude that despite limitations of any consultation framework, formalising quaternary prevention in the consultation process can help reduce the diagnostic and prescribing automatism, which has medicalized many illness expressions in the routines of primary health care services.

CON-003

The Future of Family Medicine - a Contextual View 50 Years From Now

Carl Steylaerts

WONCA Europe

Imagine 50 years from now - 2065.

Great technological advances have moved most of the (organ) specialties to extinction.

Giving birth is obsolete, cloning is the trend. Drug (ab)use is obsolete since the introduction of the Memory Loss Pill - addiction is simply forgotten. And bodies are made up of steel, glass fibre and use photosynthesis as an energy source - meet the Singularity.

Family Medicine is thriving more than ever. How come? What were the driving forces?

In what context are we living in 2065?

Are we close to Kardashev phase 1? What do we do to pass our time?

Are there new illnesses or diseases? What do we do about that?

Will there be a pandemic? What kind?

Can literature illuminate us? Which authors?

The future is notoriously uncertain. But has been thought of, somewhere... maybe now!

Keywords: Future; family medicine; policy

CON-004

Meeting the diagnostic problems introduced by increased aminotransferases or imaging tests indicating liver steatosis

Christos Lionis

Department of Social and Family Medicine, Faculty of Medicine, University of Crete, Greece

Justification

Abnormal values of transaminases and other liver biochemical test results is a common reason for a visit to a General Practitioner (GP). It is essential for the GP to comprehend the potential morbidity, infection, metabolic or malignant morbidity that is likely behind the abnormal tests and which a diagnostic algorithm should be followed. This remains an interesting and challenging subject in General Practice. The GP should be aware of the a priori probability of the underlined causes of the abnormal tests while requires background information about the diagnostic values of the tests in the area of his/her practice.

Content

This conference that is supported by the European Society Primary Care Gastroenterology (ESPCG) aims to clarify certain issues on this clinical subject. Invited speakers from this European Network will offer their expertise in an interactive manner with the audience, using case study approaches.

Evidence Based Medicine in Primary Care

Aml Ahmed Salama

Faculty of Medicine, Family Medicine Department, Menoufia University, Egypt.

In my own practice as a lecturer of family medicine, one of the most important methods of counting medical education and build up own experience is Evidence Based Medicine. According to Sackett, et al., 2001, Evidence-based medicine is the integration of best research evidence with clinical expertise and patient values". Studies showed that general physicians identified up to sixteen needs for new clinically important information in just half a day at a rate of two questions for every three patients they come across. About half of their questions were related to therapeutics and a quarter to diagnosis. EBM is aiming at: Liberation from tradition, The use of randomized controlled trials, as well as systematic reviews and meta-analysis. Practicing EBM consists of five steps: Asking a question, Collection information to answer the question, Evaluating the information for the relevance and validity, Applying the information to the patient and Evaluating the effect. Converting the patient's problem into clinical question: in specific format (PICO format). P patient problem. I Intervention or exposure. C Comparison intervention or exposure. O Outcome the patient looks. To effectively change your authority based practice we have to Evaluate your own practice, Open your mind to ideas of change, Develop an information network of high quality and relevant information. Categories of EBM Questions: four categories of EBM questions Therapy: About which treatment to be given, and the outcome of different treatment options. Diagnosis: solves questions about degree to which a test is reliable and clinically useful. Example: search for the best diagnostic test for Alzheimer's disease. Etiology: for a possible cause of disease. Prognosis: Answers questions about a patient's life span and quality of life. The best study design needed to answer the clinical question will be also included.

CON-006

Issues, Challenges and way forward for Primary Care Research: A global Perspective

Waris Qidwai

Aga Khan University, Karachi, Pakistan

Research in primary care is neglected at the level of Primary Care Practitioners as well as policy makers and academic institutions. 90% of resources are used for hospital based research and 10 % are utilized at primary care level, whereas 90% of the health related issues need to be addressed are in primary care. This is known as 90/10 gap.

Patients present with multiple co-morbidities at primary care clinics and one has to manage patients with limited resources and diagnostic uncertainty. Data needed to practice at primary care level should be therefore derived from Primary Care Practices. Hospital based data is unlikely to be usable at the primary care level. Guidelines are often developed based on hospital based data and therefore, cannot be used at primary care level. Cost; benefit ratio is in favor of investing in primary care research.

This presentation will address issues and challenges which are in the way of promoting research in primary care. Capacity building in primary care research is a challenge for a lot of countries while lack of appropriate training opportunities and infrastructure are faced by others.

A lot of opportunities exist in primary care research since a lot of work need to be done in this area. and A framework for way forward for primary care research globally is required that will address issues from a holistic viewpoint.

²Izmir Tepecik Education and Research Hospital, Clinic of Family Medicine

³İKÇÜ Atatürk Education and Research Hospital Directorate

Today, it has become quite easy to get information by internet technology. However, advances in technology also leads to some stressful situations. Find the accurate and reliable information is very difficult among information pollution. Information becomes useable as it is obtained in the right way from the true sources. Especially in the field of medicine and health; the most important factor in the literature screening to get information is reaching the right database with the right magazine publishing abbreviations.

As known; there is no standard for the journal abbreviations used in the context name of the magazines printed and published electronically. In this presentation, standard approaches to acronym titles of the national and international medical and health sciences periodicals was tried to be shared.

Especially in academic upgrading our country; number of publications cited in the citation indexes are trying to be upgraded by taking part in an international directory. The importance of the correct journal abbreviations is increasing at this point.

In this presentation; it has been attempted to explain the rules to be complied with national journal abbreviations in Turkey, according to the abbreviations used by National Library of Medicine (NLM) and ISSN center.

In particular, it is very important for the new experts and academics to make a literature research on the basis of correct abbreviations. The results of this report will help shortening services and their products, articles accompanying bibliography and the guiding document identification.

Communicating with patients with multiple chronic co-morbidity

John Yaphe¹, Maria José Ribas²

¹Community Health, School of Health Sciences, University of Minho, Braga, Portugal

²Garcia de Orta Family Health Unit, President, Clinical Council, Porto Ocidental Primary Health Care Group, Porto, Portugal

BACKGROUND: As chronic disease prevalence increases, the task of caring for patients with multiple comorbidities becomes more complex. Electronic counselling is increasing in importance as a cost-effective means of supporting patients with chronic diseases.

OBJECTIVES: The purpose of this study was to analyze the use of electronic counselling in caring for patients with chronic disease to determine patient needs when facing chronic disease and effective communication strategies that family doctors may use to meet the needs.

METHODS: The anonymized case files (n=1850) of one electronic counsellor were searched for elements of care of chronic disease. Patient needs were identified along with communication strategies used by the family physician to meet these needs.

RESULTS: Text analysis revealed patient needs for emotional support, information about the disease, specific instructions regarding care, resource management, and plans for ongoing care. Physician skills required to meet these needs included active listening, validation, support, advice giving, resource management, and long-term availability.

DISCUSSION: Electronic counselling is an efficient and cost effective way of communicating with patients facing chronic disease. These findings may have implications for the training of physicians involved in chronic care management and for the planning of services.

Key words: Electronic counselling, chronic disease

CON-009

Healthy Lifestyle Behaviors and the Role of the Family Medicine

Nafiz Bozdemir

Cukurova University Faculty of Medicine Family Medicine

In the history of medicine and health services development, people try to heal all sick people before, then they research to protect them from diseases. All efforts are directed to people as healthy sustenance purposes. To do this, people get sick of being healthy throughout their lives, so many applications that have been developed. Today these applications all of them are called healthy lifestyle.

Healthy lifestyle, the individual's health check, all behaviors that affect daily activities to choose their own health status in appropriate editing behavior.

The way of life of individuals, it also affects the quality of life as it affects survival.

The World Health Organization (WHO) estimates that 70-80% of deaths in developed countries and 40-50% of deaths in developing countries are occur due to lifestyle. This disease is the formation of bad eating habits, sedentary lifestyle, increasing bad habits, deteriorating environmental conditions and cause stressful life.

Looking at the statistics across the world in 2012; 68% of all deaths constitute non-communicable diseases. (cardiovascular diseases, cancer, diabetes and chronic lung diseases) The formation of these diseases; smoking, alcohol use, unhealthy eating and physical inactivity generate significant challenges, with the resulting metabolic and physiological changes. (elevation of arterial blood pressure, being overweight or obese, high levels of cholesterol and blood glucose)

Hypertension, diabetes mellitus (DM), coronary heart diseases and cancers in both primary and secondary protection in maintaining healthy lifestyle behaviour in the protection is great importance

The potential benefits of a healthy lifestyle;

- The mortality rate due to all causes by 40% - 65%
- Coronary heart disease by 81% - 87%
- All cardiovascular disease in %67
- The risk of stroke by 50% - 71%
- Progression of type 2 diabetes by 58% - 93%
- Cancer-related death by 36% - 60% is defined as a decrease in the range.

Nutrition, stress management, exercise, spirituality, interpersonal relationships and health responsibility among the healthy lifestyle behaviors.

In our country, usually as a secondary protection nutrition and exercise for behavior change. With the healthy lifestyle behaviors to protect health, is an important step in creating a healthy society. To do this; protecting and maintaining existing healthy situation for the importance of healthy lifestyle behavior must be noticing.

The acquisition of healthy lifestyle behavior, information, thoughts and values of individuals is subject to be modified. Therefore, individuals should be informed about the importance of healthy lifestyle behavior.

According to the Ministry of Health's 2013 Health Promotion Research in Turkey; 18 years of age and over 85.4% prefer health professionals as a source of information.

Family physicians serve continuous, coordinated and comprehensive care to the patients. About the healthy lifestyle of patients; family physicians have an important role in maintaining healthy behaviors created. They provide information about positive lifestyle changes, suggestions and support. They promote health and prevent disease through appropriate screening tests.

Last of all; family physicians should be evaluated information on healthy lifestyle behaviors, skills, attitudes and behavior. They should improve their knowledge on this subject.

LGBTI Health and Primary Care in Turkey

Filiz Ak

Family Medicine Department, Ankara University School of Medicine, Ankara, Turkey

Gender-based approach and gender and sexual diversity needs in education and practice of family medicine discipline are important. Knowing the needs or health behaviors or health risks of Lesbian, Gay, Bisexual, Transgender, Intersex (LGBTI) adults concerning family medicine/general practice (FM/GP) is important. The purpose of this conference is to review the terms of LGBTI population, history of LGBTI activism, specific health needs, expectations and self-reported risks of LGBTI communities in order to better respond to their health concerns.

FM/GP is a medical specialty of primary care that provides continuing and comprehensive health care for the individuals of all ages and genders in the context of the family and community. Having information about health concerns and expectations of LGBT community is important in order to give a better care. Health risks of LGBTI individuals are emphasized in the guidelines of Gay & Lesbian Medical Association in USA. In Turkey, lesbians and bisexual women need to learn these risks from their physicians but there are some barriers to care that impact their health status. These barriers can be eliminated by specific education without homophobia and respecting to privacy. LGBT health is one of the basic issues of gender-based medicine and must take part in FM/GP residency programs and national guidelines.

⁴Son Pisa primary Health care centre. c/ Vicente Joan Rossello 65 07011 Palma de Mallorca. Spain and IdisPa Balears research Institute

⁵IPCRG representative for WONCA-Europe. Oslo, Norway

Chronic Obstructive Respiratory Disease (COPD) is a common respiratory problem whose prevalence is increasing. It causes increasing morbidity and mortality in all countries of the world. It is principally caused by cigarette smoking. Early diagnosis and treatment is essential if we are to influence potential sufferers, and current sufferers to continue to "be young, and stay young"

The symposium will be presented by the INTERNATIONAL PRIMARY CARE RESPIRATORY GROUP and will include coverage of the following

- Diagnosis (With emphasis on earlier diagnosis) Dr Miguel Román Rodríguez (Spain)
- Investigation, including outline of spirometry Dr Svein Høegh Henrichsen (Norway)
- Smoking cessation Dr Ioanna Tsiligianni (Greece)
- Other treatments Assoc Prof Jaime Correia de Sousa (Portugal)
- Management of exacerbations Assoc Prof Jim Reid (New Zealand)

All are well known in primary care circles in Europe, especially with reference to respiratory medicine.

Keywords: COPD, diagnosis, spirometry, smoking cessation, exacerbations

Poorly controlled asthma

Dermot Ryan, Miguel Roman Rodríguez, Elizabeth Angier

Centre For Population Studies, University of Edinburgh

Although we have many treatments and guidelines available to us within primary care, the majority of those suffering from asthma are either poorly controlled or uncontrolled by GINA definition. Guidelines do not ignore the fact that there are a number of factors behind poor asthma control, but these are often presented to clinicians in a format which advocate step wise increments in medication without prompting the clinician to examine the reasons for poor control, always assuming that the diagnosis is correct in the first place. SIMPLER (Smoking Cessation, Inhaler technique, Monitoring, Pharmacotherapy, Life Style, Education and Support) is a simplified framework which describes a systematic approach to problem solving the patient with poor control: this is applicable both to new and existing patients. This approach also has the propensity to identify those patients for whom a standard approach to therapy may not be sufficient and thus stratify those patients who need referral to specialist care for further evaluation.

Keywords: Poorly controlled asthma; framework; problem solving

SYM-003

Developing information systems to improve allergy care

Miguel Roman Rodríguez, Elizabeth Angier, Dermot Ryan
Centro de salud Son Pisa, Palma de Mallorca, Spain

Rationale: it is impossible for GPs to keep abreast of all developments in all fields. How can we use IT to help us? Asthma and other allergic conditions have proved difficult to control for primary care professionals and patients themselves. The use of Informatics for clinical recordings is common and nearly universal in our health Systems, and present a new opportunity to develop this field and improve the management and follow up of those patients suffering with allergies. Integration of information systems could be really helpful to introduce alarms, control tests registers, objective measurements and to monitor the adherence to medications by electronic prescriptions. On a higher development level, they can also be useful to guide the clinicians in the best way to manage allergic conditions by aiding clinical decision making by incorporating guidelines and algorithms into the normal work flow of the health professionals electronic files.

I have no competing interests namely support from any organisation for the submitted work, financial relationships with any organisations that might have an interest in the submitted work in the previous three years and/or relationships or activities that could appear to have influenced the submitted work.

Keywords: allergy, information systems, clinical decision support

SYM-004

Is Diabetes the Index Disease? Co- and Multimorbidity in Diabetic Individuals - PCDE Symposium

Frans Pouwer¹, Manel Mata², Samuel Seidu³

¹Department Medical and Clinical Psychology, Tilburg University, The Netherlands

²Catalan Diabetes Association and Spanish Diabetes Society, Barcelona, Spain

³Hockley Farm Medical Practice, University of Leicester, Leicester Diabetes Centre, Leicester, U.K.

Diabetes and Mental Health:

Type 2 diabetes is associated with mental health problems in several ways. Research focus is on depression. The association between depression and type 2 diabetes is complex and probably bidirectional. To date, depression is associated with an increased risk of the development of type 2 diabetes, but the mechanism that links depression with the onset of type 2 diabetes is still unclear. There is also a debate whether we should screen for depression in diabetes. The pros and cons will be discussed in the presentation.

Diabetes and Cancer:

Diabetes and cancer share modifiable risk factors (overweight, obesity, and possibly weight change; diet; physical activity; tobacco smoking; alcohol). Diabetes might promote the neoplastic process through hyperinsulinemia, hyperglycaemia, and chronic inflammation. Some medications used to treat diabetes might affect cancer risk. Metformin, the most common therapy in patients with type 2 diabetes, is associated with reduced cancer risk when compared with other glucose-lowering therapies in observational studies. Although the evidence is limited, exogenous insulin is associated with increased cancer risk. In recent years, some of the newest anti diabetic drugs have been associated with cancer but the absolute risk is relatively low.

Diabetes and Cardiovascular Risk:

The most prevalent cardiovascular risk factors (Hypertension and dyslipidemia) will be the focus of the session. A debate is still alive considering Diabetes as a secondary prevention equivalent or not and the usefulness of Diabetes risk scales to consider a medication to treat cholesterol in that patients. And non less intense is the controversial opinions on blood pressure levels in patients with Diabetes. That lecture will provide you the latest available evidence on that matter and will invite to be part in that debate discussing about the best targets for that chronic comorbidities.

Keywords: Multi morbidity, Co morbidity, Diabetes, Depression, Cancer, Cardiovascular Disease

SYM-005

DAWN2 Symposium - PCDE

Antonio Nicolucci¹, Richard Holt², Ingrid Willaing³

¹Department of Clinical Pharmacology and Epidemiology, Consorzio Mario Negri Sud, Chieti, Italy

²Department of Diabetes and Endocrinology, University of Southampton, U.K.

³Steno Diabetes Center, Getnofte, Denmark

The impact of the psychosocial burden of diabetes is still not fully recognised. Many people with diabetes still face significant challenges in areas including self-management, adherence, access to support and involvement in care. Healthcare systems are struggling to accommodate person-centred models of care and to encourage people with diabetes to self-manage their condition. A network of international experts and organizations, build on the results of the original DAWN study and initiated the DAWN2™ study in 2011. DAWN2™ is a global study conducted in collaboration with the International Diabetes Federation (IDF), the International Alliance of Patient Organizations (IAPO), the Steno Diabetes Center and other national, regional and global partners like PCDE.

Prof. Richard Holt will highlight some methodological challenges of this global study that was performed in 17 countries, questioning 4785 health care professionals (of which 2066 primary care physicians), 8596 people with diabetes of which 7228 suffering from type 2 diabetes mellitus and 2057 family members. It will highlight the questionnaires that were used and how, which people were questioned and how and offer some insight in the performed analyses.

Ingrid Willaing will elaborate on education related issues in the different countries involved in the DANW2 study as seen in a primary and secondary care perspective.

Prof. Antonio Nicolucci will document an example of possible implementation action of DAWN2 results into practice. In Italy, the BENCH-D project results from the national DAWN2 data were used to make and utilise some tools in the field of psychosocial help for people with type 2 diabetes. Preliminary data from one region show a substantial reduction in diabetes related distress, associated with an increase in empowerment and psychological wellbeing.

These lectures related to DAWN2 study results will be a leading symposium for all those interested in the psychosocial care towards people living with diabetes.

Keywords: Diabetes, psychosocial, burden

SYM-006

EXPLORE Symposium – PCDE

Peter Schwarz¹, Johan Wens², Martin Hadley Brown³

¹Department of Prevention and Care of Diabetes at the Technical University Dresden, Germany

²Department of Family Medicine University of Antwerp, Antwerp, Belgium

³School Lane Surgery, Thetford, Norfolk; Hughes Hall, Cambridge, U.K.

Care for people living with (type 2) diabetes mellitus (T2DM) changes gradually from primarily medical guided patients directions (“you need to do this and that”) towards a model of shared decision making where a proactive health care team is in interaction with a well-informed individual living with a chronic condition. These new model aims to encourage patients’ self-management, stimulates education and enhance person-provider interaction, resulting in improved adherence and as a consequence better health care outcomes. Together, these elements improve the communication between health care professionals and informed individuals.

People with diabetes and clinicians might have different perspectives regarding the management of the focus disease. Diabetes management is complex and a challenge for both, patients and clinicians. Ineffective communication due to disparities between what clinicians emphasise and what people with T2DM consider increases the likelihood for misinterpretation and even distrust at both sides.

In this symposium we discuss the EXPLORE study (EXpert and Patient views on Living with and cOntrolling type 2 diabEtes) which was created to understand the complexity of T2DM management by discovering similarities and differences in perceptions of primary care providers and patients.

Keywords: Diabetes, Patient empowerment, Person-centeredness, Clinical communication skills

SYM-007

Clinical Management of Elderly people with Diabetes - PCDE Symposium

Leocadio Rodriguez Manas¹, Berry Van Der Steen², Serap Çiftçili³

¹Department of Geriatrics at the University Hospital of Getafe, Medicine Faculty at the University of Madrid, Spain

²Langerhans Institute, The Netherlands

³Department of Family Medicine, Marmara University Faculty of Medicine, Istanbul, Turkey

In this session, speakers will address the care of diabetes in the elderly. It is hoped that the issues around the management of diabetes in the elderly population will be addressed to ensure a more consistent quality in provision of care. The session is designed to support delegates understand the provision of a multidimensional integrated approach to the comprehensive management of diabetes in older people.

The issue of frailty will be addressed. These individuals are characterized by a combination of recent weight loss, significant fatigue, severe restriction in mobility and strength, increased propensity to falls, and increased risk of institutionalization.

A consideration will be given to the management of medicines in older people. Like all diabetes patients, older people are very individual, therefore there is a need to individualize the medication regimen so as to maintain an optimum balance between control of diabetes and other cardiovascular risk factors and the minimization of medicine related adverse events such as falls and admission to hospital or emergency departments.

SYM-008

Common zoonoses in Family Medicine. Problems and management

Panagiotis Andriopoulos¹, Vedat Turhan², Maria Tsironi¹

¹Faculty of Nursing, University of Peloponnese

²Infectious Diseases And Clinical Microbiology, GATA Haydarpaşa Training Hospital Istanbul

Justification:

Zoonoses are a common cause of acute infection in Family Medicine, especially in rural areas. Zoonoses can present with a variety of clinical presentations and may lead to life threatening complications. Purpose of this symposium is to focus on common zoonoses and discuss the clinical context of suspicion, diagnosis and treatment

Content:

The symposium will focus on common zoonoses such as Brucellosis, Tularemia and Leishmaniasis. Three formal lectures will be presented:

1. "Clinical Presentations and diagnostic puzzles in Acute Brucellosis" by Dr.P.Andriopoulos
2. "Tularaimia as a common cause of tonsillopharyngitis and cervical LAP" by Dr. Vedat Turhan
3. "Leishmaniasis as a public health threat in Europe" by Dr. M. Tsironi.

The symposium will focus on latest epidemiological data, diagnostic features of the diseases, treatment options

and clinical puzzles that any primary care physician may encounter in everyday practice especially in rural areas. Brucellosis is the most common zoonotic disease in the Mediterranean basin with a prevalence that varies between 10-20/100.00 and an estimated incidence of half a million cases annually. Tularemia has been reported in many countries of the northern hemisphere, in the Russian Federation, Kazakhstan and Turkmenistan, in most countries in eastern Europe and outbreaks comprising hundreds of cases have occurred recently in Portugal, Spain, Sweden and UN Administered Province of Kosovo (Serbia). Leishmaniasis is endemic mostly in East Africa and Asian countries, however the migration of populations due to political and financial turmoil suggest the need for enhanced surveillance. Lectures and discussion will serve to remind the importance of zoonotic diseases in family medicine and to present to family physicians a detailed account on diagnosis and treatment of them.

Keywords: Zoonoses, Brucellosis, Tularemia, Leishmaniasis

SYM-009

Anaphylaxis: A Primary Care Approach

Elizabeth Angier, Dermot Ryan, Miguel Rodriguez

Department of Immunology and Allergy, Sheffield Teaching Hospitals, Sheffield, UK.

Background

The rate of anaphylaxis is increasing globally. It is a medical emergency, so all primary care workers should be familiar with how to manage it. It is often suboptimally treated and under recognised and under diagnosed. The key learning points will be the recognition, treatment and the ongoing management of patients with an emphasis on taking an allergy focused history.

Content

The origin and meaning of the word Anaphylaxis with a brief exploration of mechanisms.

The recognition and assessment of anaphylaxis in practice. An examination of risk factors for severe anaphylaxis with emphasis on optimal control of asthma and consideration of other exacerbating co-factors.

How to make the diagnosis and possible differential diagnoses with an emphasis on taking an allergy focused clinical history - the cornerstone of diagnosis and supportive diagnostic tests.

Differences between adult and paediatric presentation and managements.

Initial treatment and management in the primary care environment. The role of intramuscular adrenaline,

Individualised treatment plans and the subsequent role of self management,

Education of patients, carers and schools.

Special considerations (teenagers and young adults) reasons for non compliance.

Referral to specialist centres Follow up in primary care and management of co-morbidities.

Holistic care of the allergy patient.

The presentation will refer to current guidelines of European Allergy and Clinical immunology, World Allergy Organisation, Royal College Paediatric Child Health, National Institute Clinical Excellence and Anaphylaxis guidelines of the Resuscitation Council.

Keywords: Anaphylaxis, risk assessment, clinical diagnosis and management

Background

The aim of this Symposium is to highlight current research conducted on dementia in the primary care setting in Europe.

a)EGPRN PREDEM Collaborative Group

The European General Practice Research Network (EGPRN) is currently involved in a collaborative study called (PREDEM) aimed at exploring the management and the diagnostic workup of dementia in Primary Care in 26 European Countries. In this study we wanted to explore: 1) the initial signs and symptoms, 2) who is responsible for establishing the diagnosis of dementia, 3) initiating management and drug treatment of dementia, and 4) which specific tests for cognitive dysfunction, instrumental investigations and blood tests are used in the workup. Data have been obtained from questionnaires filled by GPs in the participating EGPRN countries. Over 400 questionnaires from these 26 Countries have been collected and analysed.

b)"Dementia and primary care: has a National Dementia Strategy made a difference to quality of care" Professor Louise Robinson, Newcastle University

Worldwide, the number of people with dementia is estimated to double to 115 million by 2050. Dementia

presents healthcare with one of the biggest economical and social challenges of the 21st century. In western countries, 40% of dementia care costs are from community and care home costs (Alzheimer's Disease International, 2010). Despite this, research consistently reveals that people with dementia, and their families, are often in receipt of poorly integrated and inadequate health and social care. Care of people with dementia has particular implications for primary care, with two thirds of people with dementia currently living in their own home or in care homes, cared for by their general practitioner (GP).

Internationally some countries have introduced a National Dementia Strategy to raise the quality of care and range of services for people with dementia and their families. Drugs are available to slow the progress of the disease. However a recent report from the World Alzheimer Association (2011) has shown that some non-drug approaches could also be effective as a routine part of community dementia care but currently there is limited translation of this evidence into practice. This presentation will consider:

i) whether the introduction of a National Dementia Strategy in England has improved patient experience and quality of care

ii) the facilitators and barriers to introducing a National Dementia Strategy

c) Management of Dementia in the UK: Views of Future General Practitioners.

Eugene Yee Hing Tang, MBChB, MSc

BACKGROUND: General Practitioners (GPs) have consistently expressed a lack in confidence and skills in managing dementia. There is evidence that future GPs are generally positive about promoting the quality of life of patients with dementia (PwD) and their carers. It is unclear however what challenges future GPs face when dealing with these complex patients. We aimed to survey a large group of future GPs on their knowledge and attitudes to current dementia care.

METHODS: We formatted and distributed the survey to all GP trainees in the North East of England. This included both paper and electronic versions with one single reminder. The survey included questions on attitudes to dementia care, difficulties encountered when managing dementia and a dementia knowledge quiz.

RESULTS: 153 of 513 trainees responded to the survey (response rate 30%); 102 female and 51 male trainees responded with the majority of trainees (87.1%) feeling that much could still be done to improve the lives of PwD. Although most trainees had experience in specialties with exposure to dementia in their training around 1 in 4 trainees have or would not in the future. Main difficulties encountered by trainees in dementia management included 1) coordinating support services for PwD and their carers as well as responding to co-existing behavioural and psychiatric problems. The majority of trainees (90.4%) also felt that GPs have a key role to play in identifying those at high risk of dementia and almost two thirds feeling that a risk prediction tool would be useful. Around 80% of trainees also felt that more education in management of dementia during or after training would be useful.

DISCUSSION: PwD are complex individuals often requiring multidisciplinary support. In order to ensure that these patients continue to live well in the community educational and clinical resources could be improved for future GPs either during training or soon after completion of training.

Method

Data from the EGPRN collaborative study on dementia management in the primary care setting will be presented and discussed along with the data from UK from the experience of young doctors on the topic.

Early detection and management of frailty in primary care

Serap Cifçili¹, Güzel Dişçigil², Çiğdem Apaydın Kaya¹, Pemra Gülru C. Ünalın¹

¹Department of Family Medicine, Marmara University, Istanbul, Turkey

²Department of Family Medicine, Adnan Menderes University, Istanbul, Turkey

Justification: In our aging world, one of the important challenges of primary care is to meet the needs of the elderly. Frailty is a prevalent condition in old age and it leads to loss of independence and mortality. Early detection and appropriate management of frailty in primary care might prevent disability. However, there are a number of challenges in this area.

Content: First of all, selection of a screening instrument, which is simple, easy to use and suitable for primary care among a number of choices, seems to be a challenge. There is still a need to studies which evaluates the validity and reliability of these instruments.

Another challenge is that, in order to help the frail elderly an interdisciplinary approach is needed. However, this prerequisite may not be met in all primary care settings across the world. What is more; a number of intervention studies in the primary care setting display controversial outcomes.

Interventions including multidimensional assessment of the low-risk elderly, disease management and health promotion might reduce disability. In addition, review of medications and deprescribing have a positive effect on mortality. Strength exercises and protein-rich diet seem to be the most effective treatment options however long-term adherence is needed. In recent studies; treatment of Vitamin D deficiency, combined with exercise and protein supplementation appear to be a newer strategy. Results of cognitive training studies revealed promising results.

Nevertheless; we need to discuss effective strategies concerning management of frailty in primary care. In this panel discussion we aim to discuss current evidence and share experiences with the participants.

Keywords: elderly, frailty, primary care

SYM-012

Role of European general practitioners in communicating colorectal cancer screening

Bohumil Seifert¹, Charles Helsper², Martin Rasmussen³, Greg Rubin⁴

¹Department of General Practice, 1st Faculty of Medicine, Charles University in Prague, Czech Republic

²Julius Center, UMC Utrecht, the Netherlands

³Finnish Association of General Practice, Finland

⁴Wolfson Research Institute, Durham University, Great Britain

Justification

150 000 European citizens die every year because of colorectal cancer (CRC). The struggle against CRC is one of the health priorities in European Union. Population based colorectal cancer screening has been proven to be effective in reducing morbidity and mortality of CRC and has been adopted in a majority of European countries. European Guidelines on Quality Assurance in CRC Screening emphasize: "People who use CRC screening services should receive accurate and accessible information that reflects the most current evidence about the CRC screening test and its potential contributions to reducing illness as well as information about its risks and limitations". The role of GPs in communicating CRC screening is crucial.

Content

For Great Britain, the Netherlands, Finland and the Czech Republic the common aspects of CRC screening are

established addressed invitation system and two steps screening programme based on FOBT followed by colonoscopy in case of positive samples. Differences are in the programme management, in the role of GPs, in type and performance of faecal occult blood tests, in participation rates and capacities. These differences may project into communication strategies.

In this workshop suggested by European Society for Primary Care Gastroenterology (ESPCG) four speakers from above mentioned countries will reflect the role of GPs in communicating CRC screening in different health care systems and different screening programmes. Comparative effectiveness of methods of invitation, strategies for increasing participation in population and insights into the reasons for non-participation will be presented. A space for discussion on other aspects of GP involvement and attitudes to CRC screening in other European countries will be provided.

Keywords: colorectal cancer, screening, general practitioner, communication

SYM-013

Strategies to manage cross-border/migrant children immunization schedule

Gheorghe Gindrovel A Dumitra, Dana Stefana Popescu, Sandra Alexiu, Dorica Sandutu, Daniela Stefanescu, Anca Deleanu, Maria Lup, Raluca Zoitanu, Cristina Barbu
Immunization working group– Romanian National Society of Family Medicine

BACKGROUND: Though their immunization activity family doctors in Romania have identified the problem of lack of knowledge about the immunization history of children who are vaccinated in several European countries. These children receive true “vaccines cocktails ” due to the temporary residence of their families in various countries. The evolution of the epidemic of measles in recent years justifies the existence of a "vaccination passport" for children but also for adults with a special focus on pregnant women.

OBJECTIVE: This workshop aims to identify useful tools for vaccinators for ensuring optimal immunization of children with temporary residence in different countries of Europe and adequate protection against vaccine-preventable diseases.

METHODS: A short presentation will reveal the cross-border/migrant children vaccination situation, the importance of knowing the vaccination history, the instruments to access registered, including electronic, data for each child available now in Europe. Participants will be distributed in small groups which will be asked to work on prioritizing proposed instruments.

RESULTS: Small groups will report to the larger group and the results will be summarized and quantified and after the workshop will be communicated. At the end of the workshop a questionnaire will be used to collect individual choices of the participants.

CONCLUSION: This workshop will give participants the opportunity to use in their current vaccination activity useful communication methods to identify vaccination history. This process is designed to help develop a real "vaccination passport" extremely useful for vaccinators and families. As part of the workshop, we also propose to seek interest in establishing a WONCA Immunization Special Interest Group, and the participants are invited to contribute directly to further development.

Keywords: s: immunization schedules, prevention, vaccination, cross-border

SYM-014

Noncontraceptive uses and benefits of hormonal contraceptives

Işık Gönenc, Emine Zeynep Tuzcular Vural
Haydarpaşa Numune Training and Research Hospital

Since its approval in 1960 for contraceptive purposes, the “pill” changed many women’s lives and approach to sexuality worldwide. Although causing a relief to the centuries long trouble of unwanted conceptions, now we have a lot more to consider when prescribing contraceptive methods. The development in contraceptive medicine yielded many alternatives in the pill formulations as well as many other types of hormonal contraceptive methods. This is the result of constant interest in creating different solutions to the different types of women with many other non contraceptive needs and concerns.

After more than half a century since the approval of the pioneer method, lots of controversies remain regarding their safe use, but against all odds hormonal contraception methods are significant keystones of reproductive health and can be used throughout the reproductive years even beyond, in many women with different medical conditions and different life styles.

Their expanded use beyond pregnancy prevention include relief from menstrual symptoms such as heavy periods, dismenorrhea and irregular bleeding as well as acne and hirsutism. Many women also experience improvement in menorrhagia, polycystic ovary syndrome or endometriosis. They can also be used in the transition to the menopause relieving the perimenopausal symptoms and bleeding abnormalities. Their long term use have been associated with reduction in the risk of developing some types of cancer such as the ovary and the endometrium. They can even be used to design a woman’s yearly menstrual calendar.

Besides prescribing hormonal contraception for contraceptive needs, family physicians should be capable in making choices among hormonal methods and should be familiar with using guidelines and eligibility criteriae in order to ameliorate many accompanying health conditions and adjusting to different expectations and life styles thus enhancing the quality of many women’s lives.

"Poverty: a treat and challenge for rural general practice" – EURIPA Symposium

Tanja Pekez Pavlisko¹, Christos Lionis², Jane Randall Smith³, Oleg Kravtchenko⁴, Ferdinando Petrazzuoli⁵, Jean Pierre Jacquet⁶, Maja Racic⁷

¹EURIPA Croatia Interim President

²EURIPA Greece

³EURIPA United Kingdom

⁴EURIPA Norway

⁵EURIPA Italy

⁶EURIPA France

⁷EURIPA Bosnia and Herzegovina

Andrija Stampar phrased the definition of health accepted by the World Health Organisation: Health is a state of complete physical, mental and social well-being and not merely the absence of disease or infirmity. Even after 70 years this definition is still widely used. In multiple countries of the WHO European Region poverty rates are higher in rural areas. Demographic issues (out-migration and an ageing population), remoteness and the accompanying limited access to infrastructure and services, lower levels and quality of education, lower employment rates and less effective social protection are among the reasons for poverty's often entrenched nature in many rural areas of the Region. According to OECD: Poverty is not only about income; poor people do not only live in poor countries; poverty is not standard or static; it is only a question of „getting to zero“– but of staying there. General practitioners are among the first to meet the problem of poverty through work with

patients, healthcare system and social services. Some of us find it difficult to cope with pressure from surrounding poverty and therefore decide to work in countries which offer them better work conditions and earnings. In this way, they increase their society's poverty as the number of available health workers decreases. On the other hand, by going to rural areas of other countries they face language barriers, and with them the issue of patient safety. During the EURIPA symposium lecturers will present: a) data and evidence on poverty, homelessness and immigrants in rural Europe; b) problems and barriers in keeping practitioners involved in meeting rural poverty and homelessness; c) issues in patient safety due to new-coming practitioners; d) health policy issues aiming to alleviate the burden to healthcare and social services in rural areas.

At the symposium's events and after debate we will bring conclusions which tie into the WHO global strategy on people-centered and integrated health services.

Keywords: Rural Practice, Rural Primary Care, Rural Family Medicine, poverty

SYM-016

How to implement guidelines and training initiatives in practice: learning from the RESTORE project

Christopher Dowrick¹, Christos Lionis², Erik Teunissen³

¹Department of Psychological Sciences, University of Liverpool, UK

²Department of Social and Family Medicine, University of Crete, Greece

³Department of Family Medicine, Radboud University Nijmegen, Netherlands

Justification

There is an ever-expanding quantity of guidelines and training initiatives (G/TIs), but it is often difficult to apply them in practice. In this symposium we present effective techniques to enable participation and change, combined with robust methods to understand the implementation process.

We share experience of RESTORE, a multi-centre EU-funded study, designed to enhance implementation strategies to improve the cross-cultural primary care consultation. Our implementation journeys were based on dialogues with local stakeholders, brokered by Participatory Learning and Action (PLA) methods, around four key constructs of Normalization Process Theory (NPT). A mapping exercise identified relevant guidelines and training initiatives. Using PLA and NPT, we supported the implementation journey in each of five sites, from selection of a suitable G/TI, through local and cultural adaptation, to policy impact, delivery and evaluation.

This symposium is relevant to everyone wishing to learn more about how to implement guidelines or training initiatives effectively in primary care. The goals are to:

- explain how implementation activity is enhanced by the combination of PLA and NPT
- Provide case studies focusing on processes of selection, implementation and evaluation of G/TIs
- Offer GPs and researchers tools to undertake effective implementation journeys in their own settings.

Methods

The symposium will compose three 10 minute presentations, with 30 minutes for discussion and debate.

Christos Lionis (Crete) will describe the processes involved in selecting a G/TI in each site, how key PLA methods built stakeholder consensus around the NPT constructs of sense-making and engagement.

Christopher Dowrick (Liverpool) will describe how additional PLA techniques addressed barriers and enabled implementation of selected G/TI in each site, informed by the NPT construct of enactment.

Erik Teunissen (Nijmegen) will explain how we appraised the implementation journeys of the selected G/TIs, drawing on further PLA techniques and the NPT construct of appraisal.

Keywords: guidelines, training initiatives, implementation, participation, normalisation

SYM-017

The role of primary care physicians in addressing frailty prevention in older people

Ines Garcia Sanchez, Anna Carta, Jorge Pinto Antunes
DG SANTE European Commission

Justification

Frailty is a geriatric concept referring to a state of increased vulnerability to poor resolution of homeostasis after a stressor event, which increases the risk of adverse outcomes, including falls and disability. It has biological, physiological and psychological components.

The most distressing outcome of frailty is the older person's poor ability to function and eventually to live independently. Ultimately it increases the risk of adverse health outcomes including, hospitalisation, institutionalisation and death.

Prevalence of frailty in 65+ is high: 7-16%. Prevalence increases with age and is greater in women. The challenges in finding a standard definition of frailty that could be widely recognized and valid in different settings makes any estimation of prevalence approximate and tentative. Frail people usually have a high use of community resources, hospitals and long-term care institutions. However, frailty is preventable and disability can be avoided by detecting and treating frailty at an early stage and preventing the decline of patients' health conditions. Based on the work done for over 3 years within the European Partnership of Active and Healthy Ageing, the European Commission has taken forward frailty prevention through different channels. The aim of the session will be to raise awareness on the public health challenge at EU level that frailty in older people represent and discuss on the necessary next steps to affirm frailty prevention as a priority of European national healthcare systems. Primary health care professionals have an important role to play in this concern.

Content

Structured in 3 formal presentations and an introduction by the moderator, the following contents will be addressed:

Why is frailty relevant in public health and in clinical practice?

What are the steps to address frailty in clinical practice (screening, diagnosis, intervention)?

What is the role of primary health care physicians vs geriatricians in tackling frailty?

Keywords: Frailty, primary care, older people, health intervention,

SYM-018

Transforming primary health care in the world largest archipelago - Road map for the establishment of Primary Care Physicians in Indonesia

Indah S Widyahening¹, Dhanasari Vidiawati¹, Herqutanto Herqutanto¹, Monika Saraswati Sitepu², Novana Perdana Putri²

¹Community Medicine Department, Faculty of Medicine Universitas Indonesia, Jakarta, Indonesia

²Ministry of Health of the Republic of Indonesia, Jakarta, Indonesia

Justification

To achieve health for all, WHO recommends four primary health care reforms. Indonesia has started the reform through the implementation of universal coverage in 2014. This should be followed by service delivery reform to reorganized health services as primary care. The existing primary care providers need to be converted so they could possess the distinctive features of primary care which enable them to provide more effective, efficient and equitable care. This is a huge challenge as Indonesia currently have around 90000 general practitioners (those graduated from medical school) registered whom situated all over the wide archipelago. A road map has been

established to guide this process.

Content

The road map development was lead by the Ministry of Health together with all significant stakeholders. This presentation will describe the steps planned in the road map and the responsibilities of each stakeholder in the fulfillment of each step. To create a seamless transition, a set of policies and regulations need to be established. Different conversion tracks is made available to produce around 110 thousand competent primary care physicians by the year 2030.

Collaboration of the Association of General Practice /Family Medicine of South East Europe

Ljubin Sukriev

Center for Family Medicine, Medical Faculty Skopje, Macedonia

Association of General Practice/Family Medicine of South East Europe was founded six of June 2003 in Ohrid, Republic of Macedonia. The idea of the forming this kind of Association was born at the Third Congress of doctors of General Practice of former Yugoslavia, at 2002, in Vrnjacka Banja. At this Congress declaration were adopted. Association was established mostly for the coordination of the activities of family medicine in the region, with one AIM: to strengthen collaboration between countries in the South East Europe which have similar reforms of their health systems. Countries members of the Association are: Albania, Bosnia and Herzegovina (with Federation Bosnia and Herzegovina and Republic of Srpska), Bulgaria, Croatia, Macedonia, Montenegro, Romania, Serbia, Slovenia and Turkey.

There are a lot of activities between the countries members, such as organizing a lot of professional meetings in the form of Congress, Conferences, roundtables, workshops, studies in the Association and as well publishing activity in the Association and in every country member. Also, numerous meetings of the Association held in different countries, an which, there was a discussion about problems of mutual interest for the family medicine of South East Europe. On the last time, to advance collaboration between department of Family Medicine the countries member of the Association. Through exchange of opinion expertise and experiences, helping each others, in collobaration, mutual values of the general practitioners in South East Europe, are build. Association will coordinate activities and will stimulate national organizations of family medicine, to influence at the public opinion and the Government authorities, to accept the central role of the Primary Health Care and Family Medicine in the health systems.

Keywords: Collaboration of the Association

SYM-020

Harmonization of specialization on General Practice/Family Medicine in South East Europe

Katarina Stavrikj

Center for Family Medicine, Medical Faculty Skopje, Macedonia

BACKGROUND: Association of General Practitioners/Family Medicine of South East Europe is taking lot of activities to improve the status of family medicine in countries members of the Association. Specialization on family medicine is introduced in all South East European (SEE) countries members of the Association according the recommendation of EU directives, but with lot of challenges in there development in different countries. Collaborations between countries in defining curricula, improving teaching staff and research can contribute to harmonization of specialization and enable straitening of the family medicine.

METHODS: This study assesses the development of specialist training programmes on family medicine in SEE countries members of the Association. Questionnaire was conducted in 11 South East European (SEE) countries members of the Association.

RESULTS: Family medicine in SEE countries is now formally recognized as a medical specialty and successfully introduced into medical training at postgraduate level although in Romania, Slovenia and Turkey the specialization is compulsory. The specialist training programmes have duration of 3 or 4 years, from which in most of the countries half of the training is in family medicine practice. In some countries BiH, Croatia, Slovenia, Turkey, Macedonia and Montenegro were developed retraining programs for general practitioners to become specialist in family medicine. In most of the countries the trainees have to participate in research during the training period. In all countries there is final exam with some differences in its organization. In most of the countries the final exam is consist of portfolio, Multiple Choice Questioner test and oral exam. Objective Structured Clinical Examination exists in Slovenia, Croatia, Macedonia, Montenegro, Romania and Republica Srpska. Publishing of research paper during the training is obligatory in BiH, Croatia, Macedonia, Republica Srpska and Romania. Turkey has non standardized final exam consist only with oral part.

CONCLUSIONS: In most of the SEE countries specialization is not obligatory. There is harmonization of duration and curricula as well as participation in research. The key area of further improving are hospital rotations, the work based assessment, professional development of educators and mentors and final exam. Sharing expiriances and cooperation between medical faculties in countries members of the Association of General Practitioners/Family Medicine of South East Europe will promote further harmonization of specialization and empower the position of FM in those countries.

Keywords: Harmonization

SYM-021

Harmonization And Equalization Of General Practice/Family Medicine Work Quality In South East Europe

Biserka Bergman Markovic

Department of Family Medicine, Medical School University of Zagreb, Croatia

The countries of Southern Eastern Europe are going through a similar social development, which is reflected on the working process in primary health care, and in General Practice/Family Medicine as well. Professional society of General Practice/Family Medicine in these country are gathered in Association of General Practitioner/Family Medicine in South East Europe (AGP/FM SEE).It is therefore gratifying that A GP/FM SEE member are driving the elevation of the Organization's first Global Goal-harmonization and equalization of working process in Family Medicine in these countries, uprising the quality of work. These effort is strategic direction and goal, especially against a background of a continuing global economic crisis. A series of operational changes and adjustments were put in place in these last years through sharing experience on organizations and clinical topics by participating all the members on Congress which take place every four years, and in every year's Conference. There was analyzed A GP/FM SEE's basic attributes and comparative advatages in relation to these challenges within the context of evolving development cooperation environment, leading to revision of our core functions,

which are our means of action-improving the quality of work in General Practice/Family Medicine. Also A GP/FM is unique in having broad mandate spanning a range of activities working on norms and standard settings, data and information, policy dialogue, knowledge and technologies, partnerships, capacity development, communication and project investigations.

In view of the challenging economic circumstances for many member countries harmonization and equalization of working process through structural changes leads to the strengthening of GP/FM and will realign the health care system from very expensive secondary health care to good organized but much cheaper primary health care.

What WONCA, together with ICOH and WHO, can contribute to Workers' Health: A short history, but a challenging great future ahead!

Peter Buijs¹, Frank Van Dijk², Garth Manning¹

¹Department Work&Health Dutch Research Institute TNO Work&Employment, Leiden, Netherlands

²Coronel Institute for Occupational&Environmental Health Medical Faculty, Amsterdam University, Netherlands

The famous WHO Alma Ata-Declaration (1978) aimed at bringing Primary Health Care (PHC) to where people live and work. However, the worlds of primary and occupational health care mostly remained separated, and PHC even developed a 'Blind Spot for work'.

However, ten years ago, Wonca and ICOH (International Commission on Occupational Health) started exchanging views: Wonca Europe asked an ICOH-speaker on this topic (Kos, 2005; repeated in 2008, 2010 and 2013). ICOH invited the Wonca-presidents on topics like how to link primary and occupational health care (Milan, 2006; Capetown, 2009). In 2009 WHO joined in with her first Intercountry Consultation (Santiago de Chili), and later organizing the first WHO Conference 'Connecting Health and Labour' (The Hague, 2011).

These developments resulted in the ICOH-Wonca Statement (2014), concluding to address jointly "gaps in services, research, and policies for the health and safety of workers and to better integrate occupational health in the primary care setting, to the benefit of all workers and their families".*

How to conceptualize and operationalize these important developments? What structural support is needed? What can we learn from practice? During the ICOH 31th World Congress (Seoul, June 2015) we have organized a Special Session about these questions, inviting speakers from 7 countries all over the world to tell more about local, national and international initiatives. We asked the participants to describe the nature, strengths and weaknesses of the (experimental) practice in their country, and the future opportunities and difficulties. Furthermore the role of science and what support is expected from international organizations was discussed.

In our Workshop in Istanbul we will present some of these results, as 'food for thought and discussion' about how PHC can pay more attention to work.

Multi-national Symposium by Wonca Europe-EGPRN & Wonca World-WWPR on "Organization of the healthcare system in Europe: What facilitates & What impedes the delivery of effective primary care"

Mehmet Ungan¹, Christos Lionis², Radost Asenova³, Jean Pierre Jacquet⁴, Knut Arne Wensaas⁵, Nicola Buono⁶, Anna Nager⁷, Claire Collins⁸, Peter Torzsa⁹

¹EGPRN & WONCA Europe

²EGPRN & WWPR-WONCA World

³Bulgaria

⁴France

⁵Norway

⁶Italy

⁷Sweden

⁸Ireland

⁹Hungary

Symposium is based on a Project by WONCA World Working Party (WP) on Research. In Europe, EGRPN is in coordination with WP. The project is supported and endorsed by WONCA, WONCA Europe & its Network EGPRN and by the International Committee of the North American Primary Care Research Group (NAPCRG). Professor Ungan and Professor Lionis will co-chair the session on behalf of the 3 organizations. Format is designed to address a knowledge gap in terms of how primary care (PC) is organized around the world, and to create dialogue between colleagues and colleges about how the fundamental values of primary care can be addressed and preserved within the constraints of different healthcare systems, sometimes operating within the same country. The representatives from 7 European countries will present the facilitators and barriers that the organization of the healthcare system in their nation impacts on providing effective PC. Each presenter will have 7 minutes to and not more than 11 slides to answer the default questions in the template. A facilitated discussion will be in the last 20 minutes. The presentations will be published in web sites together with the presentations of last symposium held in the 2014 WONCA Europe Conference. The presentation format (template) is as follows:

1. INTRODUCTION: Basic demographics:

- Population
- Distribution (eg urban / rural / remote)
- Socioeconomic breakdown
- Ethnic groups
- Other relevant characteristics eg religions

2. Health system design:

- Funding – state, public
- Secondary care
- Health insurance available? Who would get? insurance available - offers choice of specialist & hospital care eg elective surgery
- Primary care
- Medicines & investigations

3. How primary care is delivered in <country> - model(s) of care

4. Access to primary health care in <country>

- How universal is it?
- What are the inequities?
- Who pays?

5. Benefits and drawbacks of health care system

- Positive aspects to PHC system, enablers of care
- Negative aspects PHC system – barriers to care
- Current challenges faced by the healthcare system in <country>

6. Impact of system on care

- Impact of PHC system on patient care / population health

7. Growing health care burden in <country>

- Identify the major health care burden that this country is facing:-

- May be non-communicable eg multi-morbidity eg diabetes / obesity / CVD / CORD

- May be communicable eg HIV / AIDS

- Ways in which healthcare system supports or impedes the capacity to provide appropriate medical services for growing health burden that is also person-and-community oriented.

8. Lessons for other countries

- Summary of what works well and does not work well in PHC in this country.

Dysphagia as a geriatric syndrome: a white paper position agreements between EUGMS and ESSD for GP

Jean Claude Leners¹, Pere Clave², Siggy Rausch¹, Aubart Monique¹, Patrick Tabouraing¹

¹LTCF ALA and Pontalze Erpeldange, Luxembourg

²Consorci Sanitari del Maresme, Universitat Autònoma de Barcelona, Spain

In 2014, members from EUGMS (European Union Geriatric Medicine Society and the ESSD (European Society for Swallowing Disorders) formed a working group to examine the management and position of oropharyngeal dysphagia (OD) among older people and agreed to write a white paper for increasing awareness and better management, especially intended towards general practitioners.

The draft has been reviewed by specialists and is applicable to GP in their daily practice.

The symposium will put forward the consensus in the recent literature and all useful aspects in our daily care of the elderly as family medicine physicians.

The symposium will include:

Prevalence and risk factors (20 min),

OD affects up to 40% of the population 65 years or older. Prevalence of OD is higher in patients with neurodegenerative diseases and is related to age, frailty and muscular, endocrine and psychiatric diseases.

Pathophysiology and instrumental assessments (30 min)

Aging slows the process of swallowing, increases the risk for particles to be aspirated. All older people need to be screened for OD in order to protect them against complications. Simple clinical screens that can detect the presence of OD by all GP and allow appropriate diet adaptation to be presented.

Treatment strategies and ethical aspects (20 min)

Complications of OD in older patients centre around malnutrition and aspiration pneumonia. To protect against these complications, patients require diet adaptation for nutritional supplementation and protection against aspirations, and oral health strategies. The focus will be put on elderly living at home or in institutions and cared by their GP.

Patients also have the right to refuse treatment and to decide which treatment to follow, so a specific focus will be put on ethical aspects for people with dementia in an advanced stage of their disease.

Discussion with the audience (20 min)

Keywords: oropharyngeal dysphagia, elderly, practical approach for GP

Building primary care in a changing environment: evidence for practice

Willemijn Schäfer¹, Mehmet Akman², Wienke Boerma¹, Dionne Kringos³, Peter Groenewegen¹, Phameu Consortium¹, Qualicopc Consortium¹

¹NIVEL (the Netherlands Institute for Health Services Research), Utrecht, the Netherlands

²Marmara University School of Medicine, Department of Family Medicine, Istanbul, Turkey

³Academic Medical Center of the University of Amsterdam, Dept. of Social Medicine, Amsterdam, the Netherlands

Justification (purpose of the activity)

The purpose of this workshop is to discuss the evidence that a number of international studies in primary care and family medicine have added to the body of knowledge for decision makers in the health sector and to exchange ideas and topics for a future research agenda for primary care.

Content

This workshop will be based on three international comparative studies on health services delivery and organization within primary care that have been conducted over the past years: the PHAMEU study (Primary Health Care Activity Monitor) and the QUALICOPC study (Quality and Costs of Primary Care in Europe), both with a main focus on European countries, and the implementations of the WHO Primary Care Evaluation Tool (PCET) in 10 countries in transition. From different perspectives and with different methodologies these studies have contributed to the body of knowledge on how primary care can help health systems become more responsive to changing health needs of populations.

The call for more evidence-based health policy making requires that researchers and decision makers jointly endeavor to critically view how outcomes of health services research can be applied in policy making. This workshop aims to bridge the gap between research and policy making by presenting core outcomes of the three studies and inform the audience how these could be translated into applicable knowledge for policy makers. The final presenter will elaborate on evolution of the Turkish health care system in the times of change and the implications of this evolution on primary care. In the following discussion, the audience will be invited to reflect on the presentations and to identify and discuss future challenges and ideas for a research agenda.

Research at the Level of the Association and the Importance of this in the Region

İlhami Ünlüoğlu

Eskisehir Osmangazi University

When we look at the broadcast sense of the word; the definition of “research” includes any gathering of data, information and facts for the advancement of knowledge. As known; the strict definition of scientific research is performing a methodological study in order to prove a hypothesis or answering a specific question. Finding a definitive answer is the main goal of experimental process.

Association of General Practice/Family Medicine in South Eastern Europe (AGP/FMSEE) was founded in 2003. The aim of this foundation is to strengthen the collaboration between the countries of SEE, which have similar reforms of their health systems. For reaching this aim; in the light of living together for centuries and having similar culture we must share our experiences and for developing the level of the collaboration we must conduct common researches. Research is also one of the basic principals of continuous medical education and developing the quality in health services.

In our region (SEE), we must have researches about all the aspects of our discipline and the practice; for increasing and revising current knowledge by discovering new facts. For organizing and completing successful researches we must have a core team, education for the young members, scientific journals, conferences and congresses and many infrastructural preparations. If we can combine, the characteristics of our discipline such as; being a young discipline, dynamism that brought community needs, belief to express qualified service, educated staffs that working beside futures and experience with researches and can put into practice the results we will be successful and will have perfect health services in primary care.

Indigenous and minority groups Issues and Health Outcomes

Tane Taylor

Royal New Zealand college of General Practitioners, Wonca Indigenous and Minority Groups Health Issues Working Party

BACKGROUND: New Zealand a population of 4.5 million people with an approximate 3000 strong GP workforce is in the forefront of building bridges amongst its multicultural community. This is underpinned by the Treaty of Waitangi signed between the Crown and Maori the indigenous people of New Zealand in 1840. The overwhelming evidence shows that Maori are over represented in poor housing, low socio-economic status, poor health, high prison rates, domestic violence etc. In 2007, The Royal New Zealand College of General Practitioners released its Cultural Competency Guidelines for General Practice, a substantial part of this document is dedicated to issues around Maori. However, the frame work is generic and can be used for all other cultures and ethnicities. It is helpful when governments and professional bodies are prepared to take on such challenges, however the greater challenge will always remain at the individual level, specifically at the General Practitioner level.

OBJECTIVES:

- General Practitioners – as health and political advocates
- International challenges and barriers
- Indigenous outlook as a Health Determinant
- Poor health outcomes and indigenous communities
- Building bridges within indigenous environments
- Facilitating cultural exchange provides more safer and efficient health service delivery

METHODS: This will be an interactive workshop. There will be a brief presentation to set the scene – The New Zealand Experience and than followed on with smaller (4 – 8 persons) group problem solving or tasks (20 minutes) with feedback from each group leading into general discussions.

Key Message(s): Will come out of the discussions

CONCLUSION: It is my belief that by encouraging open and frank discussions around indigenous and minority groups health issues we can better understand and therefore provide a more tailored and effective service to indigenous communities.

Keywords: indigenous, minority groups, equity, quality

SYM-028

Making a World Book of Family Medicine

Carl Steylaerts¹, Mehmet Ungan²

¹WONCA Europe

²EGPRN

Aim

to filter the 100 most representative abstracts that describe our job best out of the database of the collection of 20 years WONCA Europe congresses

Method

After digitalising all the abstracts of the last 20 years, a long list of 275 titles was hand-picked, then presented to a jury of Executive members, and they voted with 7, 8, 9 or 10 points. That resulted in a ranking.

Then a search began to find the original authors. Some were not found and replaced by a “body double”.

Conclusion

It is feasible to make a selection of 100 very interesting titles to make a World Book.

Since most of the authors are from European origin, we call it the European Edition.

That means that every Region can make a World Book, with this or another strategy.

In 2022, for WONCA's 50th Anniversary, a real World Book should emerge.

Who will be the author?!

Keywords: World Book; WONCA Europe; Abstracts

SYM-029

Tuberculosis as a Professional Disease among Health Care Workers

Ljiljana Cvejanov Kezunovic¹, Milena Cojic¹, Draginja Radunovic¹, Olgun Göktaş²

¹Department of Family Medicine, University of Montenegro, Montenegro

²Uludağ University Family Medicine Health Center, Görükle Campus, Nilüfer, 16059 Bursa, Turkey

Tuberculosis (TB) as the oldest and the most frequent infectious disease in the world is not past time disease. During two past decades, some factors have altered views about the risk of TB in health care workers (HCWs): the resurgence of the disease, and increasing number of multidrug-resistant cases of TB. Among patients, TB is dominant in migrants, HIV infected, and homeless.

Transmission can only occur with prolonged, frequent, or intense contact such are HCW serving high-risk clients at inpatient TB facility, laboratory, internal medicine, and emergency rooms, especially between radiology technicians, patient attendants, and nurses. The most dangerous for HCW are patients with: disease of the lungs, airways or larynx, with presence of cavitations on the radiograph, and inappropriate or short duration of treatment. The most dangerous procedures are: endotracheal intubation, suctioning, bronchoscopy, sputum induction, surgical drainage of a TB abscess, and autopsy.

Environmental factors that increase risk of transmission are: exposure in a small enclosed space, inadequate ventilation, recirculation of air containing infectious droplet nuclei etc.

HCWs at primary care level also have an important role to defend patients and themselves against TB, having in mind competencies to order appropriate tests for TB, and to give basic information as well as support to the patient and his family when suspected of having TB, communicate with the local services responsible for TB, record and report procedures associated with TB management.

CONCLUSION: it is extremely important for HCW to respect guidelines, to provide administrative controls and standard treatment plans, environmental controls, and to use regularly respiratory-protection facilities (ex. personal respirators for nursing staff) aim to reduce the risk of infection when exposure to TB is unavoidably high.

Keywords: tuberculosis, professional disease, health care workers

SYM-030

Depression Management in Family Medicine “What we do-What we can do”

Nilgun Özçakar, Vildan Mevsim, Tolga Gunvar

Department of Family Medicine, Dokuz Eylul University Medical Faculty, Izmir, Turkey

Mental disorders are both common health problems in primary care and community. The most common mental health problem seen in primary care is depression and the prevalence is reported to be between 5-19%. According to Mental Health Profile of Turkey research; 40% of the individuals visit psychiatrists, 30% other specialists and 20% doctors in primary care for mental health care. Rate of having treatment by contact primary care physician is reported to be 18%. Reforms in health and mental health emphasizing primary care have intensified in last 20 years. WHO-WONCA collaboration research emphasized systematic treatment approach at earliest possible stage in people's home and community-based environment will produce good results for mental disorders. It's well known that prevalence of mental disorders remained high all countries; contribution offered by primary care, treatment of these patients by reaching is important closing the gap can not be treated. In Family Medicine common mental disorders are known as depression, anxiety disorders and somatization disorder; antidepressants used for the treatment of all these disorders. While there is no significant change in recent years in the number of antidepressants prescribed by the psychiatrist and neurologists, an increase was seen in family physicians that prescribe antidepressants. Diagnosing and treating depression in primary care effectively and providing necessary referral scheme implementations are clinical issues that need to be updated for family physicians.

Mental health is recognized as an integral part of health. Frequent problems of mental health have great importance, may cause economic loss and disability. In light of this information, this symposium will contribute to development of depression management in primary care for family physicians, aimed to share knowledge. Framework is planned as; "Recognize the symptoms, identify, differential diagnosis, depression types common in primary care, warning signs and symptoms," "Diagnosis, screening, referral criteria" and "Treatment, prognosis, follow-up".

Keywords: Depression, family medicine, management of chronic diseases

PNL-001

Vaccination of the migrant child - a challenge

Sandra Adalgiza Alexiu, Daniela Ștefănescu, Dorica Sănduțu, Cristina Barbu, Gindrovel Dumitra, Dana Ștefana Popescu, Raluca Zoițanu, Anca Deleanu, Maria Lup
Immunization Working Group, National Society of Family Medicine, Romania

Justification

Family doctors who also provide immunizations are faced with mixing the immunization schedules from different countries to ensure protection against vaccine-preventable diseases, taking into account both the specific local epidemiological context and that of the country in which the child might migrate to. Often children receive a real “vaccine cocktail” in several countries of Europe.

This raises several problems:

1. Is there need for a "vaccination passport"?
2. What is the correct medical and ethical attitude when faced with a child with an unknown vaccination history? To try and find out their history by contacting their previous doctor or to start a new vaccination scheme?
3. What are the technical tools and legal barriers of communication between practitioners in the vaccination field?

Experts on immunization activities in several European countries will try to answer.

Content

Experts on immunization activities in several European countries will discuss the problem of child migration. This topic is very timely for both “exporting” countries such as Romania, Bulgaria, Turkey and the “importing” countries such as Spain, Italy, Germany, France, Netherlands, UK.

There are children who start vaccination in the country where they are born. Due to the workforce migration parents choose to continue vaccination in another country. There is also the reverse phenomenon, in which parents working in a Western country return to their home country with a larger family.

Experts on immunization activities in several European countries will try to answer.

Keywords: immunization schedules, vaccination passport, cross-border

PNL-002

Tobacco control in Europe: 10 years after the WHO FCTC

Recep Erol Sezer¹, Özlem Tanrıöver¹, Kristina Mauer Stender², Luminita Sanda², Gemma Vestal², Toker Ergüder²

¹Yeditepe University Faculty of Medicine

²World Health Organization

Justification:

Although impressive progress has been made in tobacco control after the adoption of the WHO Framework Convention of Tobacco Control, tobacco remains an international concern to global health, killing nearly 6 million people each year and causing hundreds of billions of dollars of economic harm annually in the form of excess health-care costs and lost productivity. To control this deadly pandemic, there have been important challenges to be faced, addressed and solved. Family physicians and their organizations worldwide have played and keep playing important roles to achieve a tobacco-free world. This symposium will describe the current status of tobacco control in Europe and in the world including a focus on the impact of new forms of tobacco use (waterpipe smoking and e-cigarettes) on tobacco control, discuss the achievements and challenges, and will provide suggestions for the future.

Chairs: Professor Erol Sezer, Assoc.Professor Özlem Tanrıöver

Speakers:

- a. Kristina Mauer Stender: WHO FCTC implementation in Europe: looking into past in order to look into future
- b. Luminita Sanda: Electronic Nicotine Delivery Systems (ENDS)
- c. Gemma Vestal: Tobacco Waterpipe Smoking: Health effects and why it needs to be regulated
- d. Toker Erguder: Tobacco Control in Turkey; Story of Commitment and Leadership

Keywords: Tobacco control, waterpipe, e-cigarette

PNL-003

Social Media: An Exercise in Time Wasting for Young People?

Peter A Sloane¹, Raluca Zoitanu¹, Harris Lygidakis¹, Luis De Pinho Costa¹, Ulrik Bak Kirk², Raquel Gomez Bravo¹

¹Vasco da Gama Movement (VdGM)

²European Society for Quality and Safety in Family Practice (EQUIP)

Justification

The immense potential of Social Media is still unknown to most Primary Care professionals. For the past five years, the Vasco da Gama Movement has had a presence at most European Family Medicine conferences spreading the word about Social Media: what it is, the potential that it can bring to communication, and how it can be used to communicate, create networks, learn, improve quality of care, educate, research, build a better image for family medicine, influence policy making and much more.

Content

The panel debate will involve the audience in the form of a huge Tweetchat which will be run live on a secondary large screen in the auditorium. The audience can participate as well as colleagues who cannot join us in Istanbul and even Conference delegates who are not attending the debate. Examples of questions to be discussed include:

-

Is Social Media just for entertainment and the young generation?

Can it really be used professionally and, if so, what is the evidence?

How are patients and health care professionals using Social Media?

Which WONCA leaders are using Social Media and what is their experience?

What are the trends for the near future?

Do the codes of conduct need an update already?

Keywords: #SoMe, Social Media, Tweetchat, communication, VdGM, WONCA

PNL-004

Does discipline have the power to maintain institutions young?

Patrick Tabouring, Hirsia Farghadani, Siggy Rausch
Université du Luxembourg, Luxembourg, Luxembourg

Justification

Institutions are establishments of education and instruction. However education tries to maintain traditional values. Consequently, institutions are based on persistence, and that's why they use discipline.

On the other hand, each institution has a mission. The community of professionals of the institution dispenses of competences which accord a power of action to them. It is exactly this power of the institution that risks, in case of abuse, to lead to institutional violence. This risk is so much greater than the institution continues to exist and feels itself in danger to get older or to disappear. So, how to preserve the youth of a well justified institution, in order to avoid it to deviate into violence?

Content

After some basic theoretical notions in order to elucidate our ideas, this last question is asked to the assistance. Several discussion groups will be constituted and after that each group will report his answers.

The totality of the answers will be discussed in plenary session, in order to evolve to a common consensus.

Finally, the common propositions will be confronted to the theoretic model that has been elaborated before by the author.

To conclude the workshop, we will try to come to a common attitude.

Keywords: education, instruction, institutions, power, persistence, discipline

PNL-005

The Pacemaker Agenda: Promoting a culture of wellness, scientific update, and happiness for teaching Professionalism and Ethics in daily practice

Pablo Gonzalez Blasco¹, Graziela Moreto¹, Rosana Irie¹, Marcelo Rozenfeld Levites¹, Marco Aurelio Janaudis¹, Pedro Subtil Paula¹, Olgun Göktaş¹

¹Sobramfa- Medical Education and Humanism, São Paulo, Brazil

²Uludag Universitesi, Aile Sagligi Merkezi, Nilufer, Bursa, Turkey

To prepare General Practitioners for the growing opportunities in private practice in São Paulo (Brazil), SOBRAMFA- Medical Education and Humanism, has developed an innovative learning agenda required for all trainees and senior members. The practicing scenarios include: Geriatric Care, Managing Complicated Patients with comorbidities in Hospitals, Palliative Care, Family Medicine Clinics and Ambulatory, Home Visits, Nursing homes and Hospices. Ethical dilemmas, and ongoing challenges come daily to our practice. An assorted routine of regular meetings booked in advance permits to combine a busy work schedule with scientific learning, develops competences and professionalism, solves ethical issues, and allows physicians to perceive personal success in their lives.

The presenters will share how they have organized the Pacemaker Agenda (PA) for more than a decade, which includes:

- Scientific “pacemaker” - Weekly Scientific Meeting. Case-based discussion, update with articles from the most relevant publications, case-decisions for specific patients supported by Evidence Based Medicine, and solve ethical issues.
- Construction “pacemaker”- Monthly Meeting. Conducted as workshops include topics to promote reflective practice: professionalism, medical education, ethics, humanism, personal development, teamwork, and leadership.
- Cultural monthly Meetings –with leaders coming from non-medical fields. (Philosophers, Journalists, Educators, Lawyers, Artist and Musicians, Entrepreneurs, Humanists). At dinner time displayed as a familiar get-together.

- Young Doctor Monthly Meeting- case-based discussions lead by medical students, and the young doctors play the facilitator role.
- Mentoring and Evaluation- every trimester the trainees are evaluated and giving feedback by their respective preceptors.

The main outcomes of the agenda are:

- Effective Training- Clinical Competence
- Mastering Communication
- Respect, Credibility and happiness

The audience will learn how:

1. A well designed agenda could combine a very busy work schedule with real scientific learning, develop competences and professionalism.
2. When the routine includes monthly meetings regarding philosophical, educational and cultural issues a familiar, collaborative and teamwork scenario is created

Challenges to our professional attitudes – treating friends and family

Manfred Maier¹, Imre Rurik³, Nazan Karaoğlu², Jean Karl Soler²

¹Dept. General Practice, Centre for Public Health, Medical University of Vienna, Austria

²Medical Education and Informatics Department, Meram Medical School, Necmettin Erbakan University, Konya, Turkey

³University of Debrecen, Debrecen, Hungary

⁴EGPRN-Mediterranean Institute of Primary Care, Attard, Malta

BACKGROUND:

Most physicians will confirm that they have been asked or have offered to provide care to friends or family members. This experience may start already during medical training and can range from providing advice, prescribing medications, issuing certificates, ordering diagnostic tests to managing difficult or chronic conditions. Due to the broad competencies characteristic for the field of General Practice and the comprehensive care provided by GPs it is likely that its prevalence is particularly high in this medical discipline. However, although they may provide the best care, GPs who are also close friends or family members of a patient certainly face several conflicts of interest in their dual roles. For example, an objective clinical perspective may be biased or endangered with an emotional or personal relationship with the patient. Further, sensitive questions may not be asked, informed consent may be skipped or documentation may not be appropriate.

The symposium:

This year's symposium "challenges to our professional attitudes" aims to address ethical aspects which arise from treating friends or family members or providing informal care to neighbours. Three to four speakers will address pro- and contra arguments and different approaches to the topic by providing background information and the evidence. In this context the guidance available from medical organisations will be reviewed and the attitudes of colleagues will be surveyed.

Participants of the symposium will have an opportunity to discuss the presentations and to add personal experiences from their own situation and experience. The symposium will conclude with a summary of the ethical considerations which arise from treating friends and family.

Keywords: ethics, professionalism, General Practice

PNL-007

Correct Exercise is Medicine!

Hatice Kurdak¹, Sevgi Özcan¹, Sanlı Sadi Kurdak²

¹Department of Family Medicine, Çukurova University, Adana, Turkey

²Department of Physiology, Division of Sports Physiology, Çukurova University, Adana, Turkey

Titles of the speeches:

1. What happened to the human who was born to move?
2. What can we do for our patients to move again?
3. "150 minutes in a week" is that all?

Almost every activity in our daily lives could be performed with minimum energy due to the rapidly developing technology. This sedentary life style leaves humans, who by nature are inclined to activity, facing with numerous health issues. Today it is well known that exercise has a crucial role in establishing a healthy life, prevention and treatment of various diseases. If the correct conditions are fulfilled in light of today's scientific knowledge exercise is indeed medicine. The benefits of exercise could be attained through proper and regular practice of the physical activities. However, increasing the amount of physical activity and ensuring that it remains effective, consistent and regular is not as easy as it is believed to be. There are numerous bio-psychosocial factors that influence physical activity habits. Therefore to guide individual in starting and maintaining regular exercise requires the detailed and holistic evaluation of the person. To identify the factors that might hinder the patients' ability to perform exercise, a detailed physical examination that includes the target organ systems should be done before starting a program. It is important that the individuals are informed about the abnormalities that might arise before during and after exercise. As they do in improving healthy behaviors, family physicals have a potential role in increasing exercise. In that sense it is of utmost important for family physicians to increase their competencies in areas of exercise consultancy. This panel aims to answer questions like "Who? Why? How long? In what frequency, intensity, volume, pattern and progression should exercise be performed?" along with up to date guidelines.

Keywords: Exercise, Family Medicine, Sports Physiology

PNL-008

Management of Childhood Obesity in Primary Care

Merve Şen, Arzu Uzuner, Nazire Öncül Börekçi

Marmara University Department of Family Medicine

PURPOSE:

Childhood obesity is a very important health problem that increasing morbidity and mortality in adulthood.

Researches show that incidence of childhood obesity is about 1.1-16% in Turkey.

The purpose of this workshop is to review the management and intervention methods for childhood obesity in primary care, to share the participants' experiences and to create small workshop groups for discussing applicable intervention methods for childhood obesity in primary care.

CONTENTS:

Management of overweight child and child with obesity will be overviewed by clinical history, physical examination and laboratory tests. The treatment options will be discussed; the effective intervention methods will be overviewed in the light of the current research. The researches about game intervention methods for gaining healthy eating and exercise habits to children will be discussed. The participants will share their own experiences in management; small workshop groups will be created for discussing applicable intervention models in primary care.

Keywords: childhood obesity, primary care, overweight, obesity

WS-001

The Resistant Patient: How to improve your Interaction in a difficult situation

Siggy Rausch, Nico Haas, Monique Aubart
University of Luxembourg

GP's often have patients, who are reluctant or opposant to any proposition of their doctor. These encounters are the most difficult and frustrating GP's can face. Resistance doesn't mean, that the specific patient rejects all the good advice of his GP, but he is opposant to parts of the proposed approach or treatment options. This is particularly regretteble in issues of important health behaviour change. It is often difficult to understand, why patients seem to jeopardise their own best interests.

In this specific situation, a motivational communication, practiced in the motivational Interviewing approach, can help tremendously to open new perspectives and issues.

In our workshop, we will first describe and practice together different situations in which the discord between patient and GP is evident.

Second, we will discuss the issues which are particularly interesting to help move on and find new ways and solutions.

Third, we will applicate these approches in smaller groups to show the direct impact on the patient and the GP.

Keywords: Resistance, Motivation, Difficult patient, Frustration in GP

Can we improve our low back pain tackling?

José Miguel Bueno Ortiz¹, Jose Antonio García Garcerán², Noemi Del Cerro Álvarez², Alberto Palacios Colom², Ignacio Ramírez Manent¹, Fernando Jose Rodriguez Martínez², Juan Francisco Mulero Cervantes², Juan Reyes Jimenez², Mari Carmen Santiago García², Rafael Luquin Martínez², Ana Maria Gómez Vizcaino², Esther García Delgado², Maria Fernández García¹

¹Spanish Society of Family and Community Medicine

²Gerencia Area Sanitaria 2. Servicio Murciano de Salud

INTRODUCTION: Low Back pain (LBP) is, after respiratory infections, the most frequent cause of consultation in primary health care. It is also one of the most common disease of Family Doctors (FD) since computerisation. Multidisciplinary and multinational evidence-based Guidelines(G) for the prevention and treatment of acute and chronic LBP were issued by a European project launched in 1999 by the European-Commission (COST B13 Action). In Spain and other countries, multidisciplinary national Working Groups adapted COST B13 guidelines to their own setting.

In 2013 in our (Sub-Regional) Cartagena-Health-Area (CHA) (200.000 patients registered) we have produced our G. Our Working Group was chaired by a Family Doctor (FD) and composed of specialists in Traumatology-Rheumatology-Rehabilitation-Anaesthesiology-Radiology-Internal Medicine and Family Medicine as well as Physiotherapists-Informatics and Health Authorities.

Prevention and treatment of chronic LBP should be multidisciplinary and include exercise and health education focusing on active management. The doctor could produce either placebo or nocebo effect.

Some related procedures have been included in the Choosing wisely initiative

Since 1995 we have run more than 60 Back-School Workshops in National and Regional Spanish Conferences. We would like to share with you our experience.

GOALS: FD should (1) acquaint with COST B13 LBP guidelines and our CHAG; (2) learn the possibilities of prescribing therapeutical exercises (TE) and postural hygiene (PH) to their patients with LBP; (3) acquaint with the abilities to help the patient to learn and carry out TE-PH as part of his treatment; (4) Change attitudes about TE-PH prescription in their daily work; (5) learn exercises to be carried out during their surgery and at home.

METHODOLOGY: Interactive. Each FD will have a facilitator. Role-playing followed by group discussion of LBP tackling in daily consultation. G will be discussed. All TE-PH recommended for the patient will performed by FD supervised by their facilitator.

Keywords: low back pain, occupational health, workshop, guideline

WS-003

Management and education of fasting patients by the general practitioner: the example of Ramadan

Melissa Dominicé Dao¹, Anbreen Slama Chaudhry²

¹Departement of Community Medicine, Primary Care and Emergency Medicine, Geneva University Hospitals, Switzerland

²Medical Education & Training Services, Switzerland

Justification:

Fasting is a commonly held spiritual and cultural practice in many communities, such as Ramadan for Muslim populations. Because of the importance of global migration, general practitioners around the world may encounter patients wishing to fast despite the presence of one or several illnesses or regular treatment intake. Ramadan fasting presents new health challenges due to the current length of the daily fasting period during the hotter period of the year in the northern hemisphere. Health care professionals should be aware of effects and potential risks associated with prolonged fasting and understand strategies to limit these risks. These strategies include: addressing the challenge and planning the fast with the patient, treatment adaptation, and structured education and support for safe fasting.

Content:

The goals of this workshop are to:

- 1) Understand the main health issues related to fasting
 - 2) Examine specific fasting issues for diabetic patients and review expert recommendations
 - 3) Practice skills to help patients make informed choices about fasting and to educate those who decide to fast
- This workshop will discuss, through a Muslim patient case vignette, how to approach the topic of fasting while considering patient's cultural/spiritual issues and health hazards related to fasting. Breaking into smaller groups for role play, participants will practice how to counsel and educate patients wishing to fast. Participants will have the opportunity to observe and practice communication, education and patient support skills, while receiving continuous feedback from organizers. Groups will reconvene to share content and process displayed by the role play. A reminder of expert recommendations will conclude the session.

Keywords: Fasting, Ramadan, Chronic Condition, Patient Education

WS-004

Innovation for primary care. The development of an {O}ptimal {C}are {D}elivery framework

Joachim Sturmberg¹, Bruno Kissling², Rick Botelho³

¹Newcastle University - Australia

²private practice

³independent researcher

Illness and disease are unique personal experiences and change over the life trajectory. Care needs change over time in light of altering physical, social, emotional and cognitive states. These aspects are rarely reflected in primary care frameworks to guide the management of people with, especially, chronic disease in primary care – most simply focus on individual diseases as if they were all independent of the person affected by them.

The experience of illness and disease emerges from interactions between the key domains of genome, cellular and immune function in the context of the person's physical and social environments. These insights require new approaches to patient care in the primary care setting.

This workshop aims to

- engage participants to reflect on their current approaches to care delivery, and
- identify deficit areas that are not part of the person's management plan.

Workshop activities will

- work in small groups to develop frameworks for whole person care taking account of cultural, socio-economic and population density factors,
- present individual frameworks, and most importantly
- identify key strategies to implement their frameworks in their community.

Participants will have the opportunity to continue the development of the OCD-framework through an ongoing online discussion forum.

Keywords: chronic illness, chronic care, community care, social health, environmental health

WS-005

Prevention of mental health problems in family medicine

Mateja Bulc¹, Leo Pas²

¹Ljubljana University Medical School, Dpt of Family Medicine

²Academic Center General Practice, Catholic University Leuven, Belgium

AIMS: To exchange experiences with the implementation of preventive activities in the field of mental health in European family medicine (EUROPREV countries).

MATERIAL-METHODS: The workshop will be based on scientific literature dealing with mental health problems prevention and consecutive health outcomes, approaches in EUROPREV countries as well as experiences of GPs in counselling their patients.

RESULTS:

In Slovenia, model practices of family medicine actively screen patients for anxiety and depression for the last 6 month. The latest results will be presented.

In Belgium collaborative models have been developed to deal with depression and prevent suicide. Several other countries have also been involved in such strategies.

Other countries' examples will be presented in discussion.

To implement effectively detection and counselling for different psychosocial problems in general practice we need to develop a clear strategy. Qualitative research shows that general practitioners integrate several aspects from existing psychotherapeutic approaches

CONCLUSION:

Based on scientific evidence, on the lessons learned from national programs, and on personal experience, the workshop will give the opportunity to discuss strategies regarding promoting mental health in the primary care setting. After the meeting participants are invited to join a Europrev working group to collaborate further in this priority area for research and quality assurance of care.

Justification: According to results of Europrev study, 14% of participating men had anxiety problems and 7% depressive disorders, 15% of women were depressive and 22% anxious.

Content

- Introduction
- Results of Europrev study
- Belgium example
- Slovenian model practices and mental health
- Discussion
- Conclusions

WS-006

Delivering person-centred care

Nigel Joseph Mathers, Helen Jayne Stokes Lampard

Royal College of General Practitioners, 30 Euston Square, London NW1 2FB, UK

Justification

The Royal College of General Practitioners (UK) recently sponsored a comprehensive independent inquiry into patient-centred care in the 21st century. The aim was to identify cost-effective solutions to the medical, social and financial challenges posed by rising levels of multi-morbidity. Eighty written evidence submissions were received and discussions with more than 50 individuals from a broad range of health, care and patient organisations were held.

The purpose of the proposed workshop is to examine the implications of rising levels of multi-morbidity and long-term conditions for primary care. In addition, a number of ways to address these issues in European health and welfare systems will be discussed.

Content

1. Keynotes (30 minutes): 2 keynotes will be delivered – the first (HSL) will summarise the key findings of the inquiry. The second (NM) will address possible responses by clinicians to the increase in long-term conditions and multi-morbidity and the associated increase in workload. The focus will be on improving the partnership with our patients. There will be time for clarification and questions.
2. Group work (30 minutes): participants will be divided into small groups to identify the obstacles and facilitators to the introduction of patient-centred care into their clinical practice at the individual, system and policy levels.
3. General discussion (30 minutes): the raconteurs from each small group will be asked to summarise the key outcomes of their discussion and common principles identified which can underpin our response to these new challenges. The intended outcome will be a consensus statement on patient-centred care in the 21st century.

Keywords: Person centred-care General Practice

Who Will Care About The Caregiver?

Özden GÖKDEMİR¹, Ülkü Bulut², Olgu Aygün³, Renata Pavlov⁴, Ana Nunes Brata⁵, Hadiye Küçükkaragöz⁶, Dilek Güldal¹

¹Dokuz Eylül University, Medical Faculty, Family Medicine Department, İzmir, Turkey

²Balçova Public Health Center, İzmir

³Karabağlar Family Health Care Center, İzmir

⁴Family Health Care Center Aleja lipa 2a, 10 000 Zagreb, Croatia

⁵USF Amora Saudável, Portugal

⁶Dokuz Eylül University, Institute of Education Sciences, İzmir, Turkey

Background

Adults caring for persons living with dementia are the second largest informal care giver group not only in the United States but also Turkey because most people with dementia are older adults aged 65 or older. Dementia care givers are more likely to experience a wide range of negative behaviors or health problems than persons with non dementia health problems. For example, dementia caregivers frequently exhibit maladaptive coping strategies, express concern about their poor quality of life, experience lower self-rated health, and report a higher level of care giver burden. In addition, dementia care givers report severe sleep disturbances, clinical depression, and higher mortality compared to other care givers. Interestingly, these negative effects of dementia care giving project to their care recipients because care givers and persons with dementia are interdependent in the family unit. These issues could be concerned for the caregivers of ill children, too. Thus, timely reduction of caregiver stress and related problems are critical for both caregivers and care recipients.

Medical education and medicine (as well as a psychologist, social worker, family counselor, nurse etc) provide care for members of professional groups are also people like themselves. After a while these professionals begin experiencing burnout about themselves. To know the limits of the individual to cope with this situation, to escape from the pressure to be perfect, to be able to continue to grow and learn without losing the motivation.

Method

Before the workshop emotional intelligence scale will be introduced and implemented.

Discussions will be carried out by forming working groups.

Workshop Program Topics:

Burn out Syndrome

Satisfaction of life (Case studies)

Quality of life (Cases and problems)

Coping Stress (Solutions to improve)

Emotional Quantities

Conclusion and Evaluation.

The results will be presented as a declaration.

Keywords: caregiver, burn-out syndrome, coping stress, life quality, emotional quantities, satisfaction of life

WS-008

Diagnostic discrimination between functional and organic bowel disease in primary care

Niek De Wit¹, Pali Hungin³, Greg Rubin³, Knut Arne Wensaas²

¹Julius Center for Health Sciences and Primary Care, Unioversity Medical Center Utrecht, the Netherlands

²Uni Health Reserach UNit for General Practice, Bergen, Norway

³School of Medicine, Pharmacy and Health, University of Durham, UK

Lower gastro-intestinal tract complaints are frequently presented in primary care. About 7% of these patients has organic bowel disease (OBD), such as inflammatory bowel disease or colorectal cancer. Most of the patients have functional bowel disease (FBD), such as the irritable bowel syndrome (IBS). Adequate discrimination is important, as both unnecessary endoscopies as well as delayed detection of OBD is burdening and costly. Presently 20-40% of patients with persisting lower gastrointestinal complaints in primary care is referred for endoscopy, but only in one-third OBD is found. Obviously the diagnostic process in patients with lower GI symptoms in primary care needs to be refined. Patient characteristics, signs and symptoms and specific lab test may in isolation all contribute to the diagnostic process, but integrated diagnostic models are required to adequately discriminate OBD from FBD.

In this workshop the state of the art knowledge regarding the diagnostics process in patients with lower abdominal complaints will be reviewed in the following presentations

1. Prof. dr..Pali Hungin, Durham, UK: The value of the ROME diagnostic criteria in diagnosing functional bowel disease in primary care
2. Dr. Knut Arne Wensaas, Bergen, Norway: The diagnostic contribution of laboratory tests and genetic markers to an adequate diagnosis of organic bowel disease
3. Prof. dr. Greg Rubin, Durham, UK. Lower gastro-intestinal symptoms and signs: how much can they tell us?
4. Prof. dr. Niek J de Wit, Utrecht, the Netherlands: The effectiveness of integrated diagnostic models in discriminating functional and organic bowel disease in primary care

These presentations will be discussed with the audience and put in a clinical perspective. The workshop will finish with recommendations to improve the clinical management of patients with lower GI complaints in primary care.

Keywords: lower gastrointestinal symptoms, diagnosis, organic bowel disease, IBS,

WS-009

Managing Emergencies in Primary care with Limited Resources

Panagiotis Andripoulos¹, Lamprini Tina², Anargyros Mariolis³, Maria Tsironi¹

¹Faculty of Nursing, University of Peloponnese

²Sparta General Hospital, Sparta Lakonia

³Health Center of Areopois, Areopolis Lakonia

Justification:

The managing of emergencies in Family Medicine is always a challenge especially in clinical settings with limited resources, such as rural areas, isolated environments or even areas of political turmoil and refugee camps. Aim of this workshop is to focus on the priorities of emergency management in general and in specific conditions in particular.

Content:

The workshop will have the form of active participation in real case scenarios of emergencies in infectious diseases, respiratory failure, cardiovascular and metabolic emergencies. Each case report will be presented and discussion upon assessment, stabilization and management will take place by the participants. Alternatives according to available resources of each setting will be proposed and additional visual aids will be presented. The participants will have the opportunity to debate on different approaches and strategies proposed by the presenters and the validity of them will be assessed in the closing of the workshop.

Keywords: Emergencies, Family medicine, rural medicine, limited resources, acute conditions.

WS-010

Toxicology in Family Medicine: Treating the Occasional Overdose

Victor K Ng, Susanne Cording

Division of Emergency Medicine, Western University, London, Ontario, Canada.

Justification:

In societies around the world, the use of both prescription and non-prescription drugs have been rising at an exponential rate. Physicians have more access to medications to treat diseases and patients have greater choice and access to the availability of non-prescription and/or over the counter medications. The number of illegal drugs or drugs of abuse have also increased with the advent of synthetic/chemically modified drugs leading to significant harm in its users.

Given the significant morbidity and mortality that can result from medication misuse or overdose, family physicians need to be aware of common drugs that may be involved. The clinical approach to assess and manage patients with undifferentiated overdose conditions should be optimized by understanding classic toxidromes. Physicians should have an understanding of the basic pathophysiology behind the overdose and recognize the importance of initiating early emergency care. Awareness of antidotes to common drug overdose is important to expedite care. Physicians should also be aware of local resources such as the poison control center or intensive care units that may need to be accessed in order to provide appropriate medical care.

Content:

The workshop will be delivered in a large group setting with clinical cases illustrating real life examples of overdose patients. Common drugs involved in an overdose will be reviewed with discussion of clinically relevant pathophysiology and key management modalities. Overdoses that require specific antidotes will be illustrated. The workshop will be interactive such that participants will be encouraged to not only ask questions, but also to share their own clinical cases and offer their perspective on treatment based on their context of practice.

Keywords: Toxicology, family medicine, overdose

WS-011

Which patients with head injury need CT imaging and when is watchful waiting in general practice a safe alternative?

Miranda Kurver, Willem Draijer

Department of Guideline Development and Science, Dutch College of General Practitioners (NHG), Utrecht, the Netherlands

The Dutch College of General Practitioners guideline 'Head injury' provides recommendations for the diagnosis and treatment of patients with head injury. The guideline distinguishes three patient categories based on the risk of brain damage. For patients with a high risk of brain damage, referral to an emergency department is indicated. Criteria for urgent referral are unconsciousness, neurological deficits, post-traumatic seizures or suspicion of severe brain injury following high-energy trauma. For patients with an increased risk of brain injury, for example those taking anticoagulants, referral to, or consultation with, a specialist is recommended. For patients with a low risk of brain injury, for example a 40-year-patient who has vomited after head injury, the guideline recommends watchful waiting and regularly waking from sleep during the first 24 hours. There is little known about the prognostic value of this approach, but it is commonly used in general practice in the Netherlands. In other countries, however, most referred patients will get computed tomography scanning. Despite widespread availability of CT imaging in the Netherlands, the policy of the guideline is to prevent unnecessary referral of patients and to reduce costs. Our aim is to explore the management of patients with head injury in other countries, in rural and urban areas. Participants will get more knowledge about risk assessment and treatment of patients with head injury in general practice.

Content:

After a short introduction about the clinical guideline for general practitioners in the Netherlands and comparison with the English and Scottish guidelines, we will initiate a discussion in subgroups about:

- the criteria for referral;
- use of CT imaging,
- use of watchful waiting and a regularly waking advice.

Then, we will plenary discuss the relevant differences between countries and between rural and urban areas and what can be learnt from the Dutch approach.

WS-012

The adolescent years..... Guiding your child and your teenage patient through adolescent and young adulthood

Enda Murphy, Kandan Loganathan, Patrick Paddy Halligan
Health Service Executive, Ireland

This workshop focus's on the challenges faced by young people in today's fast-paced technology -saturated world and provides advice for GP's on dealing with these challenges.

Discussing everything from low mood and Depression to peer pressure and cyber bullying this work shop will answer frequent questions asked by both parents and teenagers patients of GP's, and addresses what GP's can do to help stabilise young people's mental health through their journey from adolescence to adulthood

Keywords: Adolescence, Teenager, Technology, Bullying, Parent, Guiding

WS-013

Migration-related health disparities in immigrant children; the need for community oriented primary care and the role of the GP

Maria Van Den Muijsenbergh¹, Anne Meynard³, Rebecca Farrington⁴, Viviane Martinez Bianchi, Gp⁷, Marwa Achmed, Gp⁶, Guus Busser², Eldine Oosterberg⁵

¹Pharos centre of expertise on health disparities, Utrecht, The Netherlands

²Department of Primary and community care, Radboud University Medical Centre, Nijmegen, the Netherlands

³Département de l'enfant et de l'adolescent, Hôpitaux Universitaires Genève, Switzerland

⁴Community Based Medical Education, University of Manchester, UK

⁵Dutch College of General Practitioners NHG, Utrecht, the Netherlands

⁶General Practice, London, UK

⁷Family Medicine, USA

Justification:

A growing number children and adolescents in Western countries (more than 20% of all children) belong to ethnic minorities and / or are of immigrant origin. In general their health is worse compared to the health of native children of the same socio economic BACKGROUND: higher incidences of perinatal death, obesity, problem behaviour) and there are indications that they face lower quality of care – in particular less continuity of care and less timely or appropriate care, also in general practice. GPs experience challenges in providing good care for these children as their needs extend beyond the physical domain, and because of ethnic differences in symptoms and prevalence's, as well as language and cultural barriers.

Goals of this workshop organised by the WONCA Special Interest Group on Migrant care and International health and Travel medicine:

- exchange knowledge on health and health care of ethnic minority and migrant children in Western Countries
- exchange experiences and good examples for optimising primary care for these children
- expanded awareness of the need for integrated, community oriented primary care
- inspiration to provide good quality primary care for migrant children and for collaboration with other organisations in the neighbourhood.

Content

1. Health and health care of ethnic minority and migrant children.

Short Presentations on the health problems of migrant youth, the challenges primary care providers face followed by discussion and exchange of experiences.

2. Good care for migrant children: the need of integrated community oriented primary care.

An example will be presented to prevent social exclusion of migrant children. Participants will discuss in small groups the need and possibilities for GPs to work together with other organisations in the neighbourhood (schools, social work, play grounds etc).

3. Plenary report 5 minutes conclusions

Keywords: migrant children, health disparities, community oriented primary care

WS-014

Health and Health Care for Refugee Children

Maria Van Den Muijsenbergh¹, Suzanne Gagnon², Anne Meynard³, Pinar Doner⁴, Rebecca Farrington⁵

¹department of Primary and community care Radboud University Medical Centre, Nijmegen, the Netherlands

²Clinique santé des réfugiés, CSSS de la Vieille-Capitale, Québec, Canada

³Médecin adjoint chef de service Unité Santé Jeunes. Département de l'enfant et de l'adolescent Hôpitaux Universitaires Genève Switzerland

⁴GP Syrian refugee camps Turkey,

⁵GPwSI in asylum seeker mental health for Greater Manchester Mental Health Trust

Justification

Approximately 8 million refugees worldwide are younger than 18 years; refugee children make up 45% of all refugees. They are especially vulnerable in their physical and mental health and social well-being. Trauma's of violence and losses affecting themselves or their parents, harsh living circumstances, frequent moving of places and changing of schools all have a negative influence on their health. At the same time these children often need to fulfill tasks not proper for them, like interpreting for their parents, leading to unhealthy parentification. Family Physicians are usually the first to face these problems and should be aware of the impact of forced migration on the health of children. At the same time primary care offers unique possibilities to guarantee accessible quality care to all in the population, including vulnerable refugee children.

Goals of this workshop organised by the WONCA Special Interest Group on Migrant care and International health and Travel medicine:

- exchange knowledge on health and wellbeing of refugee children in different settings
- exchange experiences on problems primary care providers face in relation to good care for refugee children
- exchange ideas and good examples for optimising primary care for refugee children
- inspiration and tools to provide accessible good quality primary care for refugee children

Content

1. Health and wellbeing of refugee children in different settings.

Short presentations on the health problems of refugee children in general and in the Syrian refugee camps in Turkey as well as on the hidden problems of parenting in refugee children in the UK.

2. Primary care for refugee children: challenges and opportunities.

Discussion in small groups followed by plenary discussion about what care refugee children need, what challenges GPs meet and what they can offer and good examples.

3. Plenary report and conclusions

Keywords: Migrant children, Refugees, asylumseekers

WS-015

The Family doctor as a promotor of breastfeeding

Maria Ana Sobral¹, Daniela Runa¹, Mario Machado Cruz¹, Susana Medeiros¹, Sara Magalhães¹, Ines Dias Ferreira²

¹Unidade de Saúde Familiar AlphaMouro, Rio de Mouro, Portugal

²Unidade de Saúde Familiar Venda Nova, Amadora, Portugal

INTRODUCTION: Human milk has all the ideal nutritional characteristics for the development of biological functions, immunological protection and emotional development. Extensive research on the matter has proved its role in the diminishing of infant mortality rate and disease prevention. In spite of the growing recognition that lactation is important, the training of healthcare professionals in breastfeeding (BF) has been a little disregarded. Family Medicine aim at promoting health education and are fortunate to contact not only with pregnant women but also with children. Thus, it is crucial to provide both knowledge and proper advice on BF in the maternal and child health appointments. **AIMS:** Recognise the importance and advantages of BF; Facilitate knowledge of techniques related to BF; Identify problems that might occur in breastfeeding and provide strategies to deal with the most common difficulties; Promote BF in a way that is both satisfactory for the mother and the baby.

METHODOLOGY: Introduction: presentation, aims, knowledge test; International background; The importance of breastfeeding; Brainstorming; Turning points in BF: Exposition; Difficulties in breastfeeding and how to support:

Brainstorming /Video/Roleplay;How to keep breastfeeding when returning to work:Video. Exposition and DISCUSSION: Simulation of practical scenarios: Role-play;Self-evaluation. Discussion: Bearing in mind that this is a workshop we think that a self-evaluation test done at the beginning and repeated at the end of the session is important so that we can assess if the aims of the training were achieved. We look forward to a dynamic session that will be possible through varied teaching formats in a way that all participants will get involved in their own training. It is expected of the participants that in the end they will feel more comfortable in guiding pregnant women and parents in BF thus promoting healthy breastfeeding for both parents and children.

Keywords: Breastfeeding; Promotion

WS-016

How To Establish An Outpatient Clinic For The Elderly, Measures to Take

Didem Kafadar¹, Hakan Yaman²

¹Department of Family Medicine, Bagcilar Training and Research Hospital, Istanbul,Turkey

²Akdeniz University,School of Medicine, Department of Family Medicine, Antalya, Turkey

Justification: Population is getting old. Most of the patients admitted to outpatient clinics are geriatric, over 65. They have been diagnosed with usually more than one disease. Due to the availability of treatments for chronic diseases, they usually are on polymedications for a very long time. Elderly may face cardiovascular diseases, cancer, dementia, depression, osteoporosis, vision and hearing problems. We need specialized outpatient clinics run by family physicians. Elderly are frail and certain assessments are needed. Mental, nutritional, social evaluations with the help of certain established tools are needed. Fall risks should be mentioned to the family. If the patient has a serious disease then palliative care in all means should be introduced to the patient and the family. Quality of life of the elderly should be assessed also. Once the basic care and assessments are done if needed the patient may be referred to the geriatrists in the secondary health centers. If a standardized patient care is established, we can then promote a healthier life for them.

Content: The setting of the outpatient clinic, the basic tests for assessment of the health of the patient, further assessments to be done, tools to be used, the algorithm of the approach to the elderly, managing medications, informing the family about the patient, the follow-up are the topics to be covered. The activity will consist of problem solving by different cases, seminars and role plays and interactive discussions. We will try to develop interventions that will enable more elderly people to be and feel healthier.

- Mini-Lecture: Health Promotion in Aging Population: An Overview (20 min)
- Mini-Lecture: Screening of Elderly People in Primary Care (20 min)
- Group Work and Presentations (25 min)
- Round-up: Conclusion and Remarks (10 min)

Keywords: Aging, Family Practice, Elderly Care, Prevention, Health Promotion

WS-017

"What happens in the bedroom? Can you solve the mystery?"

Elle Mall Keevallik¹, Maili Jorro²

¹Department of Family Medicine, Tartu Ülikool, Estonia

²University of Tartu

Sexual health is an important component of primary care. Sexual health is thought to be very important for overall health and disease free life. But talking about sex and sexual health is taboo in many countries around Europe.

We as general practitioners should be able to talk about these topics without judgement or embarrassment, shame.

We need to know how to bring up the topic if patient is afraid/ embarrassed to talk. We need to be psychics literally - to understand what the patient wants.. Usually patient don't come to doctors telling they want to talk about their sex life, usually GP's need to ask multiple questions before patient starts to talk. Before asking questions - GP has to develop a certain rhythm and pattern about sexual health topic. If one is afraid to ask questions or is not a mindreader then there is a change, that the patient leaves without any help.

Asking questions about sexual health should be part of every day practice and should come naturally even if patient does not bring the topic of sexual health to the table.

We as family doctors should feel comfortable talking about sex and sexual health.

Main goal for this workshop is to make GP's comfortable to ask the questions without fear and shame. Practice makes perfect as we all know.

Plans for the workshop

- interactive game, breaking the taboos
- discussion in small groups
- role play
- conclusions and take home message - receipt how to ask the first questions.

Keywords: Sexual health, awareness, taboo, education, self-improvement

Goshinken, a practical tool to improve mind-body fitness in Family Medicine

Elena Benigni

Family Medicine department, Accademia Shoho, Italy

Justification: Physical exercise is the based-evidence first step to approach lots of different disorders. Reviews suggest that in order to improve self-efficacy and long-term adherence in healthy behaviors, as well as to improve personal stress management skills in primary and secondary preventions. Nevertheless, physical activities require more time and money than patients want to spend, so we often skip this, which is the more effective and significant step to treat and prevent the most common and onerous diseases. In our Academy we provide free courses to these doctors and health workers who want to provide to their patients a shorter assessment tool, which is called Goshinken (in Japanese it means "Energetic Martial Art").

Goshinken involves a very easy and powerful exercises to any ages and physical conditions. These activities, besides stimulating metabolism and oxygenation, also could improve the empathy amongst doctors (or health workers) and their patients, so the compliance and care feelings become easier.

Content: We will demonstrate the 10 basic Goshinken exercises (for at least about 2-5 minutes) with every participant. We want to stimulate discussions on the practicality and applicability of the short techniques learned among our patients population. In the end, we hope there will be proposals for researching and collaboration within family physicians from different countries to promote exercises in the daily clinical practice.

Keywords: Physical exercise, primary preventions, secondary prevention, compliance, Goshinken

community health

WS-019

How To Assess Risk-Taking Behaviors and Sexuality During An Adolescent Care Office Visit

Grace Abi Rizk, Jihane Naous

Department of Family Medicine, Saint Joseph University, Beirut, Lebanon

Justification

Detection and discussion of risk-taking behaviors in adolescents by pediatricians and family physicians could be limited if not addressed adequately. Using a psychosocial review of systems and ensuring confidentiality could increase spotting problems and reduce morbidity and mortality among teenagers.

Content

To have effectual communication and retrieve valuable information, physicians should facilitate convenient interview environment and acquire technical interviewing skills to approach adolescents. The workshop aims at providing further understanding on using screening tools, open-ended and/or oblique questions as techniques to move from a topic to another during a HEEADSSS interview. Moreover, the workshop will highlight on the importance of confidentiality in adolescent care, particularly when assessing risk behaviours, gender identity and sexuality among other psychosocial matters.

Oblique questions about peers' activities and peer pressure; beside CRAFFT questionnaire: a validated office-friendly tool; are useful in an initial assessment to obtain understanding on substance misuse including tobacco and alcohol, and its related safety.

Assessing sexuality can be evenly addressed by passing from general to specific questions. Gender identity, sexual history/behaviour and joint occurrences should be screened. In fact, in sexuality, more than in other topics, the teenager will not tell unless asked specifically. He/she might not know what is considered sexual activity and what he/she should disclose from his/her sexual history.

Family physicians can practice on clinical case scenarios to improve their interviewing skills. The use of recommended open ended questions/tools for each category assists in developing their unique interviewing style. If a screening question turns positive in any section, the interviewer can go deeper and provide education and counseling. The most important is that the teenager feels the support and guidance whenever he/she wants to reveal something, whether during the actual visit, or in a subsequent one.

Keywords: adolescents, risk behaviors, sexuality, gender, substance misuse

WS-020

GPathome: how to get evidence based patient education in our pocket

Roy Beijaert, Ton Drenthen

Dutch College of General Practitioners (NHG)

“Justification”: Guideline based patient education is becoming a major tool in general practice in the Netherlands. Tablets and smartphones bring our patients self-efficacy *“in their pocket”*.

The purpose of our workshop is: to share knowledge and experiences on patient education (PE) in our countries. To discover the relation between PE and the regional guidelines and the different levels of PE in different countries. How do the different GP's use evidence based PE before, during and after consultation?

“Content workshop”:

“Introduction”: In 2011 the NHG launched a public website with information about health and diseases, named in Dutch: thuisarts.nl (*“GPathome”*). The aim was to 1) guide patients in the labyrinth of health-related information on the internet, 2) support GP's in patient education and 3) produce patient versions of our guidelines. In 2013 a *“GPathome”* app was launched. We had 13.000.000 visits last year.

“Summing up/discussion”: how does patient education work in your country/region? Do you use it? Do your patients use it? Do you use it together?

“Plenary feedback”: result from each group

“Description of Dutch situation”: The content of our website *“GPathome”* is largely based on evidence-based practice guidelines of the Dutch College. Information on what to do and when to call the GP is given. The patient can reach in to: illustrations, short video's, patient decision aids and evidence based e-health self-management tools. 90% of the Dutch GPs use *“GPathome”* in daily practice.

“Discussion in small groups”:

What is the relation between PE and your regional guidelines?

What are the different levels of PE available in your region?

How do you use PE before, during and after consultation?

“Plenary feedback”: result from each group

“Sharing Tips and tricks”: including tips and tricks from the *“GPathome”* team

“Take home message”

Keywords: patient, education, guidelines, evidence, ehealth, selfmanagement, selfefficacy

A Visit to the Temple: The Cardiac Exercise Stress Laboratory

Vincent Ted Leon¹, Ruth Wilson²

¹Dept of Family and Community Medicine, John A. Burns School of Medicine, University of Hawaii, Honolulu, Hawaii, USA

²Department of Family Medicine, Queen's University, Kingston Ontario Canada

Justification:

Despite advances in medical therapy, cardiovascular disease continues to cause high morbidity and mortality in all developed nations. More recently, the WHO and other leading international organizations have brought attention to cardiovascular disease as a leading cause of death in all developing nations, as well. Early detection and prevention of cardiovascular disease is more important than ever. The Cardiac Exercise Stress Lab provides important diagnostic and prognostic information, and plays a therapeutic role as well.

Content:

In this Workshop, participants will learn about exercise stress testing, using standard protocols of treadmill testing, cycle ergometry testing, and upper extremity ergometry testing. A brief presentation will include indications and contraindications for testing; common hemodynamic responses to exercise; interpretation of common ECG findings; The Duke Treadmill Risk Score; The additional diagnostic value of stress echo imaging and nuclear myocardial perfusion imaging.

Three Case Studies will include a 30 yr old female with morbid obesity who is seeking bariatric surgery, a 50 yr old male with cardiac risk factors, and a 70 yr old male who is a competitive ironman triathlete and endurance runner.

Participants will break into small groups to discuss how cardiac exercise testing is performed in the countries where they practice, and international comparisons will be made, and discussed.

Dr Leon is the Director of the Cardiac Exercise Stress Laboratory at Queens Medical Center, and was a Bariatrician and Associate Director for their Comprehensive Weight Management Program from 2004-2012, where he did all the pre-op and post-op evaluation for over 1000 morbidly obese patients who underwent bariatric surgery. He is also an endurance runner and 4 time Ironman triathlete, most recently at the 2012 Kona Ironman World Championships. He has worked as a medical tent physician for the Ironman Championship since 1999.

Community based preventive activities and the role of the GP: A Europrev workshop

Ton Drenthen¹, Karolien Van Den Brekel², Mateja Bulc³, Eva Jurgova⁴

¹Dutch College of GPs, Utrecht, The Netherlands

²Julius Health Centers Leidsche Rijn, University of Utrecht, The Netherlands

³Ljubljana Community health center and Ljubljana University Medical Faculty, Ljubljana, Slovenia

⁴Slovak Society of General Practitioners

Justification

To effectively deal with the increasing burden of lifestyle related chronic disease in Europe, a combination of a personalized prevention approach and a community based approach in the population is needed. In Europe and other parts of the world there are effective and [promising community-based programs and interventions, which aim to prevent disease and create a healthier population.

Aims of this workshop: to show best practice examples of community based prevention programmes and to exchange experiences with the implementation of these programmes in GP and public health in EUROPREV countries.

Content

In this workshop some examples of good practice programmes in different countries will be presented. The role of the GP in prevention and the collaboration with public health will be discussed.

In the workshop the following aspects will be presented:

- Brief introduction about Europrev network (Mateja Bulc)
- Introduction and examples of community based prevention activities in Europrev countries (based upon survey among Europrev delegates, and the role of the GP in prevention (Ton Drenthen)
- Examples of community based prevention in different countries:
 - The Netherlands: with a variety of best practice preventive projects, such as the web-based cardiovascular health risk assessment (the personal health check), an implementation model has been developed for 'infrastructure of a healthy community, by Karolien van den Brekel, GP, Utrecht The Netherlands
 - The national preventive programme in Slovenia- model family medicine practices, by Mateja Bulc
 - The Slovakian experience, by Eva Jurgova

Discussion with the audience: share experiences, success factors and pitfalls about strategies to organize community based prevention programmes in a variety of countries with different background. How to implement community based health prevention, and how can GP's collaborate with public health and other partners in the community.

Conclusion and take home messages

Keywords: prevention, public health, health promotion

WS-023

M- and E-mental health: new dimensions to deal with problematic alcohol use. An update by the ALCOHOL WORKING GROUP OF EUROPREV

Lodewijk Pas¹, Frederico Rosario², Mateja Bulc³

¹Academic Center General practice, Catholic University Leuven, Belgium

²University of Lissabon

³Society of Slovene family physicians, Ljubljana, Slovenia, Chair of Europrev

AIMS:

- To review strategies to implement effectively identification and counselling in general practice on problematic alcohol use
- To review how m and e-health can be integrated into general practice to deal more effectively with problematic alcohol use (EUROPREV countries).

BACKGROUND:

Increasingly web programs are used for self-care on alcohol problems. Multimedia use and mobile phones show different possibilities. Several reviews were made to illustrate their possibilities, but integration in general practice is only in its beginning.

METHODS:

This workshop will create a forum for exchange about different models for support of general practice involvement on dealing with problematic alcohol use. Barriers to implementation will be explored and models how to overcome them.

In particular we will review e- health initiatives through self-evaluation and web based support only, integrated care into multiphasic prevention and a stepped care model. The advantage of active follow up through m-health will be additionally discussed.

Web-based self-care has also shown to be effective. However to enhance more long term effects a strategy is needed to include self-care, general practice counselling and specialist support into a comprehensive primary care strategy with active follow up. M-health can provide a methodology for latter element.

CONCLUSION:

As we adapt our health education to stages of change of our clients, we must adapt also our support to different general practices to help them to become more actively involved in dealing with problematic alcohol use. A model will be presented how to do this. After the meeting participants may be invited to join collaborative action in this field.

Keywords: prevention,alcohol,e-health,m-heath,quality assurance

WS-024

Management of “cross-border” children`s immunization schedule

Gheorghe Gindrovel A Dumitra, Dana Stefana Popescu, Sandra Alexiu, Cristina Barbu, Daniela Stefanescu, Dorica Sandutu, Maria Lup, Anca Deleanu, Raluca Zoitanu

Immunization working group– Romanian National Society of Family Medicine

One of the greatest challenges Romanian family doctors face is how to manage the health needs of children coming from families that temporarily live in different EU countries following the implementation of EU laws on freedom of movement for workers. The recommendations on preventing transmissible diseases through vaccination vary throughout Europe. Every country`s healthcare system has a different approach regarding vaccination, therefore Romanian physicians / GPs have to adapt the immunization schedules taking into consideration several facts. Some of them are: the country where the child was born or raised in, the history of the child regarding vaccination, the epidemiological context but also the future of the child. The general practitioner`s approach towards this problem involves assuming responsibility for the child, his/her family, the community and last but not least for the fellow GPs from other countries. What is the right approach regarding this problem? Are there other GPs dealing with this situation? If so, how are they dealing with it ?

Keywords: immunization schedules, prevention, vaccination

WS-025

The right words to promote vaccination

Sandra Adalgiza Alexiu¹, Arzu Uzuner², Dilek Guldal³, Christos Lionis⁴

¹Immunization Working Group, National Society of Family Medicine, Romania

²Family Medicine Department, Marmara University Medical School, Turkey

³Family Medicine Department, Dokuz Eylul University Medical School, Turkey

⁴Clinic of Social and Family Medicine, Faculty of Medicine, University of Crete, Heraklion, Greece

Most countries are facing decreasing vaccination coverage in children. One of the causes is the increase in refusals from parents to vaccinate their children. Therefore, counseling of the parents done by family doctors who vaccinate becomes extremely important. Family doctors must have solid knowledge related to building the messages used when speaking to parents, the media and healthcare decision makers.

AIMS

The aim of this workshop is to understand the importance of using proper / right words in building simple-messages and key-messages in order to promote vaccination, using communication tools on the subject, at our disposal on the CDC, ECDC and WHO websites.

OBJECTIVE

After the workshop, the attendees will:

- ♣ be able to compose at least three pro-vaccination messages
- ♣ take home a few good ideas about using proper / right words in communication with patients, media and decision-makers

METHODS

Introduction by moderator (5 mins)

1. Brainstorming (10 minutes): collecting goals and expectations and list the main challenges the participants face in their counselling set.

Lecture 1 (15 minutes): data about the decreasing vaccination coverage, main causes of the process, focus on parents refusals and the importance of good communication skills of GPs.

Lecture 2: (15 minutes): buliding simple-messages and key-messages, targets and resources for GPs

2. Work in small groups (20 mins)

3. Reports from the small groups (15 mins)

4. Conclusion by moderator (10 mins)

EXPECTED RESULTS

The findings, strategies and resources identified in the workshop will be summarised. As part of the workshop, we also propose to seek interest in establishing a WONCA Immunization Special Interest Group, and the participants are invited to contribute directly to further development.

Disclosure: No conflict of interest declared

Keywords: Refusal, key-words, communication tools, messages

WS-026

Vaccination for pregnant women

Dorica Sandutu, Sandra Alexiu, Cristina Barbu, Gindrovel Dumitra, Daniela Stefanescu, Raluca Zoitanu, Dana Stefana Popescu, Anca Deleanu, Maria Lup

Immunization working group—Romanian National Society of Family Medicine

Starting with 2004, CDC'S ACIP strongly recommended flu vaccination for pregnant women in second and third trimester, during the winter and spring season. The immune system, and organs, are changing during the pregnancy, so, women are more likely to become ill or to have a more severe clinical evolution of the illness. Moreover, complications occur more frequently leading to hospitalization or even exitus. This translates, from the baby point of view, in an increased risk of abortion, or premature delivery.

Therefore, flu vaccination is recommended for all pregnant women during the second and third trimester.

Antibodies produced by the mother's immune system, will protect baby during the flu season.

It was noticed the hesitation, or, even refusal of the vaccination on behalf of pregnant women, and the doubt, resistance from families, facing these preventive action on the future mother. Vaccinator doctor – family doctor in Romania, must answer the questions from pregnant women, present her information about efficiency and safety of vaccine, in turn to risks of vaccine refusal.

Keywords: pregnancy, flu, prevention, vaccination

WS-027

Vaccine advocacy the bridge between vaccine refusal and social norms awareness

Valeria V Herdea, Liliana Barbacariu, Ileana Brinza, Emiliania Costiug, Ioan Muresan, Raluca Ghionaru
Romanian Association for Education in Family Medicine

Justification

In the modern world we have three great threats: antibiotic resistance, low vaccination coverage and peace maintenance. All three are strongly interconnected. If vaccination coverage will be low, people are not vaccinated, we will be serious clients for infectious diseases. If we are not vaccinated, we will take a lot's of antibiotics and finally we will be in the situation to see high rate for antibiotic resistance. The diseases, born poverty, conflicts and in the end wars.

The modern era seems to be in conflict with her own progress

PURPOSE: sharing vaccine advocacy's experience with GP's team from other countries in finding optimal solutions for raising rate of vaccination coverage.

Vaccination remains indisputably the most cost-effective measure that we can preserve the life and health of dearests. Evidence based medicine remains the best lawyer for this purpose. Life has demonstrated the superiority of prevention versus treatment.

Imunise, prevent and protect: protect yourself first. Protect your family and then the community where you live.

The concept of freedom- must be well understand. You can understand the freedom like the understood necessity. The aspect means taking the hole responsibility and accepting social norms without that life can not be conceived as evolving but as an involutive process

The existence of a National Immunization Program (NIP), compliance with this program to the whole population, optimal vaccine coverage of over 95%, remain the guarantor of maintaining long-term health of our children

Key words: advocacy, teams, norms

WS-028

Why do we drink?

Marta Velgan, Helena Tamm

University Family Clinic

Excessive alcohol consumption can lead to different health related, psychological and socioeconomic problems. As family doctors it is our job to screen people's alcohol consumption, inform them about the health risks related to excessive alcohol consumption and help them drink less or quit for good. But how often do we ask ourselves why do we drink? Why do our patients drink? Understanding why we consume alcohol can help us as doctors understand our patients better and help people to be healthier. We can also use this knowledge to influence the health policy in our countries to create an environment which supports better choices.

The session will start with group work, each group will get a sentence to finish or a question to answer; for example "Alcohol makes people feel...", "Why people drink?", "In which occasions people drink?" etc. In the next part there will be a short presentation about the psychology of drinking and the theory of planned behavior. At the end of this session we will practice on each others using motivational interviewing how to talk with our patients about alcohol consumption, how to find out the reasons why they drink and their motivation to change their behaviour.

Keywords: Alcohol; psychology; health policy

WS-029

Practical tips for obtaining a PAP smear in family practice

Işık Gönenc, Zeynep Tuzcular Vural

Department of Family Medicine, Haydarpaşa Numune Training and Research Hospital, Istanbul, Turkey

Justification: In 1928, Dr Papanicolaou discovered that cells in the cervix changed microscopically in appearance before they became cancerous. Thus the Pap smear is recognized as a screening tool to find early warning signs that cancer might develop in the future. The sensitivity and specificity of Pap smears are reported to be 72% and 94%, respectively. Obtaining a Pap smear is a simple, quick, and painless procedure. It only takes a few minutes. No drugs or anaesthetics are required and it can be done by anybody who is working in primary health care.

Content: A Pap smear is a valuable tool, which incorporates the partnership of both the physician and the pathologist. Although a very valuable tool, unfortunately there are still inadequacies in collecting cells, preparing slides, interpreting and managing the results. So it is crucial to know the techniques of proper Pap smear taking and to be able to interpret the results of the report to complete the picture. In this workshop we aimed to emphasize some tips for getting the best results from Pap smears. The participants will get a chance to review proper sexual history taking before obtaining Pap smears. They will review the "Bethesda" terminology and practice the management of Pap smear results. New techniques will be introduced and their advantages and disadvantages over one another will be discussed. Each participant will be able to know the necessary equipment and to obtain smears from a life size pelvic model and learn the techniques of preparing slides. Participants will also discuss their experience with PAP smears.

Keywords: PAP smear, Bethesda terminology, screening, cervical cancer

WS-030

Cancer & Palliative Care WONCA Special Interest Group: The role of family doctors in cancer rehabilitation and palliative care

Annette Berendsen¹, Dorte Gilså Hansen², David Weller³, Alis Ozcaker⁴, Hibah Osman⁵, Scott Murray³, Geoff Mitchell⁶

¹University of Groningen, Netherlands

²University of Southern Denmark, Denmark

³University of Edinburgh, United Kingdom

⁴Uludag University, Turkey

⁵American University of Beirut, Lebanon

⁶University of Queensland, Australia

Justification - Family doctors play an increasing part in the care of cancer patients. This workshop will provide up to date evidence on cancer rehabilitation and palliative care

Content - The workshop is divided into two sections - for each we will present latest evidence and research, along with practice tips for family doctors.

The first section will focus on some of the many problems family doctors must address in helping patients with cancer and their partners/care givers. Patients whose acute phase of cancer treatment is over typically have complex needs. Support from their family doctors can take many forms including detection of recurrences and psychosocial support. There are many issues that can sometimes be neglected, such as chronic co-morbidities, fatigue, lack of physical activity, help with returning to work and mental health problems.

The second half of the workshop will focus on palliative care, and include the results of a study of family physicians' attitudes about end of life care in Turkey (including opioid prescribing, communication issues etc), and an overview of palliative care developments in Lebanon (examining strategies to maintain function in our patients despite advancing illness).

Presentation type – workshop format, comprising speakers followed by panel discussion. The workshop will be interactive, and will focus on practical, up-to-date advice to help family doctors enhance their roles in caring for cancer and palliative care patients

Keywords: cancer rehabilitation, palliative care

WS-031

Effective Interventions with survivors of violence- Primary care interventions that empower patients, increase provider efficacy, and reduce morbidity in a residency curriculum

Patrick S Mcfarlane

Department of Family Medicine, Family Medicine Center and Residency Program Eastern Maine Medical Center

The confounding issues of interpersonal, cultural and institutional violence is often conflated with patient medical conditions.

Robust psychosocial tools supported in the scientific literature are available, and physicians are in a powerful role to address violence in primary care settings. When the physician addresses violence briefly and directly using these tools it can reduce morbidity in patients and patient families, while also improving the outcome of medical interventions, reducing physician burnout and empowering the physician by understanding the context of the patient.

This presentation will focus on a powerful curriculum used in residency education that has been transformative to practice in terms of adding a perspective related to patient history, empowerment, and activation and changing physician review of systems to include violence.

Resident physicians report that their practice and engagement with patients has radically improved and that patient course and outcomes have been improved. Physicians report that their competence in their professional

behavior to be significantly changed ($p=.0003$). This curriculum is now an edited and peer reviewed part of the American Academy of Family Practice (AAFP) and Society for Teachers of Family Medicine (STFM) Residency Curriculum Resource, and the pilot study was peer reviewed for discussion at the STFM annual conference. What is new here is that the number of residencies and primary care clinics involved has increased to a national sample of 11, and these data will be presented. Workshop participants will receive the curriculum in brief and the pilot curriculum outcome study data and methods, and then participate in a discussion about interpersonal and community violence (IPCV) in their clinic and discuss primary care approaches to intervention and how they might use this curriculum and assessment or invent their own.

Keywords: Primary Care, Violence, Intervention, Curriculum, Educational Research

WS-032

Detection and multidisciplinary collaboration in intimate partner violence primary care. A EUROPREV and WONCA SPECIAL INTEREST GROUP FAMILY VIOLENCE WORKSHOP

Lodewijk Pas¹, Sylvie Lo Fo Wong², Carmen Fernandez Alonso³, Joyce Kenkre⁴, Tanja Pekez Pavlisko⁵, Raquel Gomez Bravo⁶, Gene Feder⁷, Mateja Bulc⁸

¹Academic Center General practice, Catholic University Leuven, Belgium

²Primary health care, Gender & Women's Health, Radboud University medical center Nijmegen, Nijmegen, the Netherlands

³SEMFyC, Consejeria de sanidad, generancia regional de Salud Castilla y Leon, Valladolid, Spain

⁴University of South Wales, Glenmorgan, Wales, UK

⁵Primary care center Kutina and Wonca Rural working party, Croatia

⁶VASCO DA GAMMA

⁷Bristol University, UK

⁸Society of Slovene family physicians, Ljubljana, Chair of Europrev, Slovenia

Justification:

Intimate Partner Violence has been gaining epidemic dimensions in last decades and emerged as an important health issue in the 21st century. It is responsible for the greatest burden of disease in young women, and is associated with poorer physical and mental health, risk behaviors and early death.

The Wonca Special Interest Group is a network of researchers and trainers coordinating efforts to develop effective implementation strategies for family violence and intimate partner violence in particular.

In this workshop participants will be informed about recent advances how to detect counsel and collaborate in the care for intimate partner violence. Priorities for research will be defined and collaborative projects may be initiated.

Content:

Topics dealt with will be

1° Prevention and counselling for intimate partner violence

2° Multidisciplinary approach of intimate partner violence according to available facilities

3° Research priorities about intimate partner violence

Results of network exchange and selected projects will be presented by representatives of the Special Interest Group and discussed with the audience. Following issues prepare the debate: Conclusions of the Europrev meeting in Austria on prevention and the Wonca Rural meeting on multidisciplinary collaboration. A synthesis of experiences in the Netherlands, Australia, Belgium, Spain, US and UK discussed at a preconference symposium will also be presented.

Presentation type:

Introductory presentations will be followed by small group work to discuss application possibilities in countries of all participants.

To conclude:

Representatives of national colleges and academies of general practice / family medicine are invited to join actively the development of a common implementation plan to put into practice the role of general practice in dealing with IPV. A formal statement WILL BE submitted to WONCA in his regard. Promotion of resource materials online to support this role should be promoted.

Keywords: domestic violence, intimate partner violence, prevention, multidisciplinary collaboration

WS-033

Dealing with intimate partner violence from a family perspective in different cultural contexts

Lodewijk Pas¹, Amanda Barnard², Lorraine Bacchus³, Carmen Fernandez Alonso⁴, Sylvie Lo Fo Wong⁵, Nena Kopcovar⁶, Joyce Kenkre⁷, Tanja Pekez Pavlisko⁸, Angela Taft⁹, Abimbola Silva¹⁰, Omneya El Sharif¹¹

¹Academic Center General Practice, Catholic University Leuven, Leuven Belgium

⁵Primary health care, Gender & Women's Health, Radboud University medical center Nijmegen, Nijmegen, the Netherlands

⁶Department of Family Medicine, Faculty of Medicine, University of Ljubljana, Ljubljana, Slovenia

⁷University of South Wales, Glenmorgan, Wales (UK)

⁸Primary care center Kutina and Wonca Rural working party, Dubrovnic, Croatia

⁹Judith Lumley Centre (formerly Mother and Child Health Research) La Trobe University, Melbourne, Australia

¹⁰University Nigeria

¹¹Cairo University Hospitals, Egyptian Fellowship Board

Justification:

Family violence has been gaining epidemic dimensions in the last decades and has emerged as an important health issue in the 21st century. It is responsible for the greatest burden of disease in young women, and is associated with poorer physical and mental health, risk behaviors and early death.

The WONCA Special Interest Group is a network of researchers and trainers coordinating efforts to develop effective implementation strategies for family violence and intimate partner violence in particular.

In this workshop participants will be informed about the results of a consensus process about dealing with intimate partner violence with particular attention to the family perspective and local communities. This exchange was held as an interaction online within the WONCA SIGFV.

Content:

Topics dealt with will be

1° Intimate partner violence and the local family perspective including children witnessing violence

2° Intimate partner violence and cultural diversity

3° Research priorities on domestic violence

Synthesis of literature and projects in a number of countries (e.g. Netherlands, Australia, Belgium, Spain, US and UK) will inform the debate. Results of network exchanges and selected pilot projects will be presented by representatives of the Special Interest Group and discussed with the audience as follows:

WONCA Rural meeting in Croatia (Topic 2, April 2015)

WONCA Africa meeting (Topic 1, 2 and 3, April 2015)

EGPRN meeting in Rumania (Topic 3, May 2015)

Presentation type:

Introductory presentations per topic and small group work to discuss application possibilities in countries with participants.

To conclude:

Representatives of national colleges and academies of general practice / family medicine will be invited to join actively the development of a common policy plan to implement and study the primary care role. Resource materials will be shared online after the meeting for country application.

Keywords: intimate partner violence, mental health, multidisciplinary care, family, abuse, women health, prevention, detection, counselling

WS-034

The right to be protected – a practical approach to Family Violence within Primary Care

Sara Belinchon, Sara Rigon, Rosa Avino, Raquel Gomez Bravo, Nina Monteiro, Yusianmar Mariani, Elena Klusova, Sara Conde, Monica Teran

VdGM Special interest group on Family Violence

Justification:

Family Violence, particularly violence against women, is one of the most pervasive and yet least recognized human rights abuse in the world. It is universal and prevalent across many different cultures and countries. According to a WHO global survey, conducted in 2013, 35% of women worldwide have suffered physical and/or sexual abuse. Moreover, other studies have shown that up to 70% of women have experienced violence by an intimate partner during their lifetime.

Raising awareness of this reality is essential for health care providers, because the more this form of violence is recognized, the easier it will be to identify and address it.

GPs are among the first line of care contact with victims and their families. Despite this, training in recognizing and addressing domestic violence is not common in Primary Care training or undergraduate education.

Content/METHODS:

This workshop aims to give Family Doctors a set of tools that should render their daily practice when dealing with family violence victims.

The proposed activity will include:

- Presentation about key theory points on family violence;
- Group DISCUSSION:
 - o Propose different situations and give the opportunity to each group to develop options on how to manage each case by using role playing and case-scenario discussion.
- Report back and final discussion.

CONCLUSION: It is fundamental that Family Doctors should be provided with the necessary tools in order to recognize, treat and manage domestic violence with confidence. However, there is a real lack of education in this field jeopardizing the opportunity for GPs to play a key role in the fight against such a devastating epidemic, with multiple consequences for its victims. With this workshop, participants will gain a valuable insight into the approach to family violence, thereby allowing them to be more prepared to deal with it, particularly through early detection.

WS-035

Intimate partner violence: picking up signals and responding in daily practice

Sylvie Lo Fo Wong, [Toine Lagro Janssen](#)

Department of Primary & Community Care, Gender & Women's Health

Justification

Intimate Partner Violence (IPV) is: violence caused by a partner in an intimate relationship. IPV is worldwide a prevalent problem and it is one of the most important causes of disability and disease in women both in the short and long term. Mostly women are victimised. Physical injuries are thought to be the classic presentation of abuse, however mental health consequences are far more common. Family doctors hardly identify abused although a full-time working FD encounters at least 1-2 women weekly with a background of IPV. The aim of this workshop is to educate family doctors on how to recognise and respond to abused female patients in a day-to-day doctor-patient encounter.

Content

This workshop presents a short overview of the epidemiology, consequences of IPV on mental and physical health. The focus lies on how to recognise and respond to abused women in family practice in a day-to-day encounter. With film fragments (English subtitled) of a consultation in family practice participants are invited to discuss their observations according to assignments in subgroups that will be interspersed by plenary discussion and clarification. The film is produced especially for education purposes. The premise is the ordinary doctor-patient encounter when help-seeking behaviour, clinical presentation and a patient's history are of great value in confirming a suspect of IPV together with how to ask and respond. Active contribution will be asked of the participants.

Keywords: intimate partner violence, female patients, doctor-patient encounter

WS-036

WWPWFM - Practical skills workshop for GPs in responding to family violence

[Amanda Barnard](#)¹, Jan Coles²

¹Medical School, Australian National University, Canberra Australia

²Medical School, Monash University, Melbourne Australia

WWPWFM workshop – Practical skills workshop on training GPs in responding to family violence

Justification: With growing recognition of the role that GPs play in identifying and responding to family violence and intimate partner abuse, this workshop is a practical training session to equip GPs with knowledge skills and confidence to ask about abuse and respond appropriately to disclosure

Content: The workshop is based on GPs needs identified through WWPWFM workshops at Wonca meetings over the last 2 years, the RACGP Abuse and violence -Working with our patients in general practice (4th edition) clinical guidelines, and training material developed by Professor Jan Coles and colleagues
Workshop. format – 3 hours

The workshop will focus on 3 areas of skills train and development, It will consist of a brief overview of the topics, discussion of skills and strategies, and then the opportunity for participants to practice new skills in a safe and supported environment. This will include case studies and role playing opportunities. The areas covered are

- Identification and initial response and validation- how to identify, ask about and respond to initial disclosure of intimate partner abuse
- How to assess risk and assist women to reflect on their own safety and their children's safety.
- Ongoing management and counselling strategies. – Whilst recognizing that optimum management involves a multidisciplinary approach, there are effective counselling strategies that GPs can use to assist survivors of abuse.

The workshop will conclude with a plenary discussion and tips on GP self care when working with survivors of abuse

Keywords: skills training; family violence; intimate partner abuse

Domestic Violence Workshop: What we think? What we do?

Nilgün Özçakar¹, Akça Toprak Ergöner², Özden Gökdemir¹, Gözde Yeşiltepe², Seval Yaprak¹, Melike Çağaydın¹, Ülkü Bulut³, Gamze Akyol¹, Mine Tevrizoğlu¹

¹Department of Family Medicine, Dokuz Eylül University Medical Faculty, Izmir, Turkey

²Department of Forensic Medicine, Dokuz Eylül University Medical Faculty, Izmir, Turkey

³Narlıdere Public Health Center, Izmir, Turkey

Background

Violence can be seen in every aspect of human life, is important and growing public health problem in the world. Violence is reported as mostly seen in the family atmosphere and against women (WHO). Violence against women is a phenomenon extremely common in the world, regardless of culture, economic development and education level. According to the "Survey of Violence against Women in Turkey"; exposure to family violence in any period of life is high. Although violence against women, children and elder is common all over the world, reflected in a small number of forensic medicine. In many cases of domestic violence in communities having great risk of exposure, socially it is considered normal. Domestic violence often not reported for reasons such as lack of awareness, security, shame and fear.

Wounded individuals physically and psychologically, referral to health organizations and judicial authorities in time is important for people health as well as detection of medical evidence. Domestic violence, as it directly affects woman suffering violence, children growing up in violent environments negatively affected by physical and mental aspects. This situation defines vicious cycle of violence; domestic emphasizes the importance of combating violence.

Method

Discussions will be carried out by forming working groups.

Workshop Program Topics

- Convention on preventing and combating violence against women and domestic violence (Istanbul Convention)
- Family Protection Law No. 6284 on the Prevention of Violence against Women
- Workshop (Case studies - legal and social aspects of the evaluation)
- Available coordination and cooperation related to violence against women cases and problems
- Solutions to improve the possibilities of coordination and cooperation and functionalized
- Conclusion and Evaluation

We believe that with this workshop producing solutions which contribute to the production by demonstrated the problems and experience.

The results will be presented as a declaration.

Keywords: Domestic Violence, Family Medicine, Forensic Medicine

WS-038

Gender-based Violence against Women and Approach in Primary Care

Filiz Ak, Zehra Dağlı

Department of Family Medicine, Ankara University School of Medicine, Ankara, Turkey

Violence which is a major public health issue affects most women and girls as a result of the patriarchal system which leads to the gender inequality. The first approach to victims of violence and sexual violence is important not only for the field of forensic medicine but also of primary care as well. Women who are the victims of violence and sexual violence have many lifelong acute and chronic health problems. Primary care physicians should give a woman centered care to the women who are the victims of intimate partner violence and sexual violence. The updated resources on this subject have been published by the World Health Organization by the end of 2014.

Gender, adopted by the World Health Organization (WHO) as one of the determiners of health, develops postpartum by means of the existing social values and stereotypes of the society surrounding the individual. Gender inequality and sexism negatively affect the health of women and lead to many additional health risks. Violence against women as a result of gender inequality and sexism is one of the main issues that need to take place in medical education and family medicine residency training program.

This conference aims to review the principle concepts about violence and gender inequality, data from World and Turkey, the health problems as the result of violence, Turkey's problem of violence against women, the responsibilities of Turkey and state parties obliged by Istanbul Convention, GREVIO process and basic approaches and practices that primary care physicians must develop according to the guidelines of WHO.

Keywords: gender inequality, violence, intimate partner violence, sexual violence

WS-039

European Forum for Primary Care (EFPC) Workshop on Interprofessional Collaboration (IpC): Communication and Language

Diederik Aarendonk, Kathryn Hoffmann, Jan De Maeseneer, Mehmet Akman

European Forum for Primary Care

OBJECTIVE: a common understanding about the role of Communication and Language within Interprofessional Collaboration of the involved stakeholders.

Specific objectives

- The identification of factors that hinder and/or facilitate the development of shared language between health professionals working in primary care as part of the item-list after 3 months
- Sharing knowledge on the way Interprofessional Collaboration is developed within different health care systems in Europe and how language/terminology barriers can be overcome
- Stimulate the discussions between professional associations on what they can do to improve communication among themselves at practice level as well as at policy making level
- Increase the awareness about art and theatre, being a good way to improve communication and the use of language, for all stakeholders in the development of- and practicing in- primary care.
- Assess the impact of international comparison challenges in relation to selected primary care professions and their implications for further research and data interpretation.

Format

The Forum will use deliberately other formats like role-plays and theater to create more impact and engagement within the target groups.

Keywords: Primary Care; Interprofessional Collaboration; Communication; Language; Health Systems Research and Terminology; Humanities

WS-040

EURIPA workshop: What options for developing integrated care in rural family practice in Europe: what building blocks need to be in place?

Zalika Klemenc-Ketis¹, Carolyn Wallace², Oleg V. Kravtchenko³, Donata Kurpas⁴, Christos Lionis⁵

¹Department of Family Medicine, Medical School, University of Maribor, Taborska 8, 2000 Maribor, Slovenia

²Faculty of Life Sciences and Education, Pontypridd, University of South Wales, Wales

³University of Tromsø, Fredensborgklinikken, P.B. 994, 8001 BODOE, Norway

⁴Department of Family Medicine, Wrocław Medical University, 1 Syrokomli St., 51-141 Wrocław, Poland

⁵Clinic of Social and Family Medicine, School of Medicine, University of Crete, Greece

Justification

Integrated care has recently become a very popular term in health policies. The UK RCGP defined it as “patient-centred, primary care led, delivered by multi-professional teams, where each profession retains their professional autonomy but works across professional and organizational boundaries to deliver the best possible health outcomes”. This definition is horizontal. However, other definitions are vertical, from primary to acute service levels which could lead to the misunderstanding of integrated care itself, as was presented recently by Amanda Howe.

Integrated care in rural family medicine settings deserves more attention and discussion and with this workshop, we aim to share news and ideas on developing of integrated rural care model in family practice in Europe.

Content

A workshop will consist of two parts. In the first part, short plenary presentations about the experiences of integrated care and patient-centred care in rural family practice from different countries will be given. Then, the participants will be divided into several groups to discuss about what are the elements of integrated care in rural family practice and to propose the elements of the integrated rural care model. During the workshop, a nominal group technique will be used.

We expect that during the workshop, many good ideas for integrated rural care will be presented as well as threats and challenges across European health care systems will be indicated by moderators and participants. These would serve as a good basis for the development of the integrated rural care model in the European rural family medicine.

Keywords: rural family medicine, integrated care, management

EURIPA Workshop: Modernising our Rural Practice: from old patterns towards the future

Oleg V Kravtchenko¹, Tanja Pekez Pavlisko², Ferdinando Petrazzuoli³, Jean Pierre Jacquet⁴

¹EURIPA Norway

²EURIPA President Iterim, Wonca Working Party on Rural Practice – Vice-Chair. Croatia

³SNAMID Caserta Italy, Dept. of Clinical Sciences in Malmoe, Centre for Primary Health Care Research

⁴Dept. of General Medicine, Med. Faculty, University of Grenoble, France

In the modern and fast developing world, affected by society stratification, global migration, social insecurities and austerity measures, threatened by local and regional conflicts, it is crucial to create and maintain highly professional and fast-adjusting healthcare, available for all groups of population. This task is especially important for the rural areas as these are going to be affected first and hardest due to their relatively vulnerable economic and demographic situation. At this EURIPA (European Remote and Isolated Practitioners Association) workshop the authors are going to define the most crucial challenges and steps in developing such a healthcare, comparing different existing models cross-country and cross-continent, based on theory and practice. During the interactive groupwork the participants are going to define 3 tasks of the effective healthcare system and 5 variables in creating and maintaining such a system in rural location(s). In the end the authors and the participants are going to produce a consensus paper on the subject, which could be used as a reference in the future.

Keywords: healthcare, rural practice, modernising, effective

WS-042

What do 'people-centred' and 'integrated' health services look like? A Project by the World Health Organization, World Organization of Family Doctors and International Alliance of Patients' Organizations

Maria Luisa M Pettigrew¹, Amanda Howe², Michael Kidd², Dheepa Rajan⁴, Shannon Barkley⁵, Nittita Prasopa Plaizier³, Hernan Montenegro³, Alison Lightbourne⁶

¹Department of Health Services Research and Policy, London School of Hygiene and Tropical Medicine, UK

²World Organization of Family Doctors

³Department of Service Delivery and Safety, Health Systems and Innovation, World Health Organisation, Geneva, Switzerland

⁴Department of Health Systems Governance and Financing, Health Systems and Innovation, World Health Organisation, Geneva, Switzerland

⁵Department of Family and Community Medicine, Baylor College of Medicine, Houston, USA

⁶International Alliance of Patients' Organizations

Universal health coverage (UHC) requires that individuals have access to necessary, effective health services across the full spectrum of service provision and the life course. In recognition of the difficulty providing such services and in response to demand for services which are oriented around the health needs of individuals and communities the World Health Organization (WHO) is developing a strategy on People-Centred and Integrated Health Services.

This workshop aims to discuss participants' understanding of 'people-centredness' and 'integration' and explore potential strategies increase these. Ideas generated in this discussion will build on qualitative analysis of previous responses to a global survey of primary care providers and patients in order to inform the implementation of the WHO strategy. Interim strategy reports on the evidence base around people-centredness and integration of health services will be presented.

The workshop will take the form of a focus group discussion and informed consent will be sought from participants.

Keywords: People-centred, integration, primary care, health services, policy, WHO

WS-043

Medical Leadership - a Competency for GPs

Sietse Wieringa, Renee Weersma

Platform Medical Leadership

Medical Leadership involves the competency and the will to trigger change by influencing others, society and yourself to improve healthcare. Recently it is gaining recognition as a key feature of a new generation of GPs in order to tackle challenges and innovate general practice. In this workshop we will explore your medical leadership skills, your ideas for the future of general practice and provide some tools to start changing healthcare today.

This workshop is organised by PML in cooperation members of BOHAG and FMLM. PML (Platform Medical Leadership) is a Dutch cooperation of young GPs, young specialists, young public health doctors, young doctors in elderly care and the Royal Dutch Medical Association (KNMG). The BOHAG (Policy and Organisation GP Advisory Group) is the union of Dutch GPs with a special interest and training in leadership and management. FMLM (Faculty of Medical Leadership and Management) is the association of doctors with a special interest in medical leadership in the UK.

Keywords: Leadership, Management, Competencies

WS-044

Comparative Global Health Care Systems: Single-Payer and Multi-payer ways of achieving Universal Health Care: What Can Family Doctors Do?

Vincent T Leon¹, C. Ruth Wilson², Claudia Chaufan³

¹John A. Burns School of Medicine, University of Hawaii, Honolulu, USA

²Department of Family Medicine, Queen's University, Kingston Ontario Canada

³University of California San Francisco, USA

Justification:

"I regard universal health coverage as the single most powerful concept that public health has to offer. It is inclusive. It unifies services and delivers them in a comprehensive and integrated way, based on primary health care."

"A health system where primary care is the backbone and family doctors are the bedrock delivers the best health outcomes, at the lowest cost, and with the greatest user satisfaction" Dr. Margaret Chan, Director-General WHO
Family doctors have an important role to play, not just in delivering primary care, but in shaping health policy in their country and around the world, working towards systems which provide access to high quality health care for all, and a family physician for every family.

Content:

After a brief introduction to the status of health care systems around the world with regard to their status in providing universal health care, participants will divide into small groups. Each group will represent a country, and participants will work through common tasks of family physicians in that country, using resource material provided. This will allow for an appreciation of how universal health coverage is achieved in various health care systems, along with the advantages and disadvantages of various policy frameworks used at a national level. Participants will have the opportunity to learn about three systems in depth. The small group format will encourage interaction and relationship-building amongst participants. The conclusion of the workshop will include information and discussion about WONCA's current efforts to promote universal health care at WHO and nationally.

Keywords: universal health care; health policy; single payer systems

WS-045

WONCA Conflict and Catastrophe Special Interest Group

Rich Withnall¹, Tanja Pekez Pavliško², Hüseyin Avni Şahin³

¹Defence Professor of General Practice, Royal Centre for Defence Medicine, ICT Centre, Birmingham Research Park, Vincent Drive, Edgbaston, Birmingham, B15 2SQ, UK

²EURIPA President Iterim Wonca Working Party on Rural Practice

³Department of Family Medicine, Medical Faculty of Yuzuncu Yil University, Van, TURKEY

Justification.

WONCA's special interest groups (SIGs) comprise groups of individuals who share a common interest that is consistent with the Mission and Objectives of The Organization. The WONCA Executive has just approved the formation of a Conflict & Catastrophe SIG to specifically consider the impact of conflict or catastrophes upon health. The workshop proposer is the Convenor of the WONCA Conflict & Catastrophe SIG.

Content.

A brief presentation, then group discussions about the new Conflict & Catastrophe SIG considering the impact of conflict or catastrophes upon health, including:

1. Provision of useful in-country and regional contacts and networks of family medicine doctors.

2. Sharing of best practice and developments in conflict and catastrophe family medicine.
3. Discuss the management of medical services during conflict or post-catastrophe in areas that have big needs but are resource poor.
4. Encourage collegial discussions between countries.

Background & Aim.

Military actions, conflict and catastrophes may all adversely impact upon quality of life, universal human rights, gender equity and health inequality. The Inverse Care Law highlights how those in the greatest need often received the lowest, if any, standards of care. This SIG provides a forum through which WONCA can lend its support to improving the quality of care of peoples of the world when they face some of life's greatest challenges.

Method.

A soft launch of the WONCA Conflict & Catastrophe SIG.

Results.

The result of the discussions will be reported and published in the Journal of Turkish family Physicians.

Conclusions.

Introductory meeting of the WONCA Conflict & Catastrophe SIG.

Keywords: Humanitarian, Conflict, Catastrophe

Rational prescription and use of medicines in Primary Care

Diederik Aarendonk¹, Anna Stavdal³, Nena Kopcevar Gucek², Isabelle Moulon⁴

¹EFPC (European Forum for Primary Care)

²UEMO

³WONCA

⁴EMA

OBJECTIVE: Increasing impact of Primary Care professionals on the European Medicine Agency (EMA) policy and decision making.

Specific objectives

- Clarify

- o what can GP's together with Pharmacists and other primary care providers contribute towards EMA in order to reach the best rational use of medicines?

- o What would be the best way of communicating between EMA and healthcare professionals to support their role in the safe and rational use of medicines?

- o What countervailing force Primary Care can be in the EMA decision making against the current input by specialists and pharma industry?

- o How to contribute to the Agency's scientific work intended to continuously improve benefit-risk assessment of medicines throughout their life-cycle?

- Stimulate the discussions between professional associations on what they can do to improve their impact towards EMA

- Increasing the number of European GP's involved in advising the EMA in order to include their specific knowledge on the prescription of drugs at Primary Care level

- Support the Agency to gain a better understanding of how medicines are being used in real clinical practice and how EU regulatory decisions impact clinical practice

Format

1. Introduction (10 minutes) Nena Kopcevar Gucek
2. Lecture (20 minutes) EMA representative

Questions and comments.

3. Lecture (10 minutes) Thierry Christiaens / Pieter van den Hombergh / Walter Marrocco / UEMO about the Evaluation System of Drugs and the added value for GP's to become involved

Questions and comments

4. Group discussion 15 minutes

Exchange of experiences.

5. Report from the group discussion (15 minutes)

6. Plenary discussion and final remarks. (15 minutes)

Keywords: Primary Care; European Medicine Agency; rational use of drugs

WS-047

Rural Proofing for Health Policy: Use of a Rural Lens - an update from the WONCA Working Party on Rural Practice

David Schmitz, Tanja Pekez Pavliško

University of Washington School of Medicine, Seattle, Washington, United States

Several countries have adopted "Rural Proofing" strategies to examine law, policy and regulation as related to rural health. The goal of these tools is to look with a "rural lens" to examine the potential for unique consequences on health and patients in rural areas. The impact of some decisions can too often have negative unintended consequences without such a process. During this interactive workshop, the currently published tools used in areas such as the United Kingdom and Southern Africa will be reviewed while the attendees will also have the opportunity to learn techniques and to develop skills to apply their own strategy for Rural Proofing. Case examples will be collected from WONCA Europe to contribute to this international effort. The WONCA Working Party on Rural Practice is developing a paper for use worldwide and this workshop is an opportunity to contribute to a tool that will support Family Physicians addressing policy issues resulting in better health for rural patients.

WS-048

Factors influencing the career decisions of young female general practitioners. Is there variation within European settings?

Dudley James Graham¹, Amanda Barnard²

¹Royal Centre for Defence Medicine, Birmingham, UK

²Australian National University, ANU Medical School, Acton, Australia

Justification

Within many settings, the demographic profile of the General Practitioner workforce is changing. A significant change has been the balance of male to female GPs. This long recognised trend looks set to continue. In parallel to a changing workforce composition, a number of more general attitudinal changes linked to career planning and expectations amongst the younger workforce are emerging. These have significant implications for future General Practice workforce planning. Whilst current research has concentrated on factors that affect workforce planning in single nation settings, no research has been published to date that explores qualitative comparators between countries.

Content

The aim of this workshop will be to explore an understanding of factors that influence the career decisions of young female general practitioners from different national settings, capture participant narratives and draw together the dataset for analysis, reporting and potential publication.

Activity: A brief presentation will introduce the recent Masters level research that DG has conducted in a UK setting: What influences female military First5® GPs' career decisions? A qualitative exploration. Building on these findings and drawing reference from relevant national and international literature, a backdrop will be drawn to enable small group discussion towards exploration of the workshop question.

Participants will be invited to consider and develop topics in small groups. During a final plenary, groups will present their findings and a collective summation of themes will be drawn together.

No competing interests to declare. DG has undertaken research on the career decisions of young female military General Practitioners as part of a funded MSc. Although he is a member of the UK Defence Medical Services and paid from Ministry of Defence (UK) funds, he has not been directed in any way by the MOD in relation to this work.

Keywords: career decisions, female, general practitioner,

WS-049

Should A Physician Use Short Interview Techniques in Primary Care?

Pemra Unalan¹, Bilge Turgut¹, Selcuk Akturan², Cigdem Apaydin Kaya¹, Mehmet Akman¹

¹Department of Family Medicine, Marmara University, Istanbul, Turkey

²Department of Family Medicine, Tercan Community Hospital, Erzincan, Turkey

AIM: Primary care physicians need to use counseling approaches on their patients to help health risk behaviours and ambivalence to change. And it is hard to find a cultural sensitive language in official interview. Motivational interviewing is accepted as a tool to help either physicians or the patients in counselling. On the other hand time is an important obstacle to provide counseling in primary care. The aim of this workshop is to display short interviewing techniques as an alternative. To share experiences and refresh knowledge and skills about short interviewing techniques in primary care is the objective of this study.

METHOD: After an allocation about the participants' needs and experiences about short counseling techniques the objectives of the workshop program will be re-structured. This workshop is planned to enhance the experiential learning of the primary care health workers, depends on their needs, uses interactive education methods, presents current evidence about the efficiency of the short interviews in primary care. There will be three short tutor presentations; 1-"Can we make a favourable difference by short interviewing techniques?" 2-

"Background and essentials of motivational interviews" 3-"Types of short interviewing techniques in primary care". A role play will be shared to observe, to assess and to brief the opportunities and/or limitations of the interview. A handout that will help the participants to follow the short interviewing technique in practice will be delivered. The workshop will finalize with a feedback session both about the roleplay and the whole workshop program.

Keywords: short interview, motivational interview, primary care

WS-050

WONCA ICOH Statement and Pledge on Primary Health Care&Workers' Health: how to proceed? Introduction to a Workshop PHC&Workers' Health

Peter Buijs¹, Frank Van Dijk²

¹Dutch Research Institute TNO Work&Employment Department of Work&Health

²Coronel Institute of Occupational&Environmental Health Medical Faculty, Amsterdam University, Netherlands

During the last WONCA-Europe conference (Lisbon, 3-7-14), President Michael Kidd's keynote stated, that WONCA and ICOH (International Commission on Occupational Health) were looking at the health of workers and their families, especially in developing countries, saying that health and safety are threatened by poor working conditions. "We recognize that most health care and preventive services for workers and their families is provided in primary care settings by family doctors like you and me. So today WONCA and ICOH launch a joint statement on workers and their families, pledging to work with partner organizations (WHO, International Labor Organization) to address gaps in services, research and policies, for the health and safety of workers."

This Statement revitalizes the famous WHO 1978 Alma Ata Declaration, saying that PHC aims at "... bringing health care as close as possible to where people live and work." Yet, as the WONCA-ICOH Statement says: "...health and safety of people at work are too often addressed separately from their health outside of work."

For decades only 10-15% of the global workforce has (some) occupational health care, mostly in developed countries. The poorest, most in need, with the most precarious working conditions, have none. Meanwhile, workers are the backbone of all economies, so their health is very important for themselves and their families as well as for the country's prosperity and social provisions.

PHC covers 70-80 % of the world population, containing many workers far beyond reach of current occupational care: in informal economies, rural and migrant workers. However, many GPs seems to have a 'Blind Spot' for work-related health problems.

So the WONCA-ICOH Statement conclusion "...to better integrate occupational health in the primary care setting, to the benefit of all workers and their families." creates new opportunities to improve workers' health, to be discussed in our Workshop

Keywords: workers' health, delivering basic occupational health care, family doctors

WS-051

Wisdom and Wellbeing - A priority for tomorrow's doctor

Sabena Yasmin Jameel, Katharine King
Health Education England - West Midlands

Justification

What does it mean to be well? Perfect health or "the strength to be" ? This workshop will explore definitions of health in terms of flourishing and well-being. We will look at the predominant ethical frameworks which shape health provision and discuss some of the shortcomings and institutional failings. A neglected area in Medical Education is virtue ethics, which may enhance the way we approach medical education with the goal of attaining Aristotle's 'Eudaimonia' (flourishing). It encompasses the fact that life has a purpose, and the way to seek the good life is to strive for moral excellence. The challenge is to implement this in our societies of moral pluralism. We will then look at the concept of Practical Wisdom (Phronesis) as an intellectual virtue in clinical practice and discuss if it can be taught.

Content

Small groups will consider character attributes required to be a good doctor (ranking exercise), these results will be compared to previous studies and to other ideas within the room. We will then contemplate what exactly it means to be wise, considering our own role-models and mentors, their attributes and professional virtues. We will trial a few wisdom inventories and discuss their validity. Finally we conclude by debating whether a 'wisdom approach' to medical education would not only result in a more fulfilled workforce but also improve patient outcomes.

Keywords: Virtue Ethics, Bioethics, Well-being, Flourishing, Wisdom, Phronesis

WS-052

Working Together to Enhance Family Medicine Education: Tools from the Wonca Working Party on Education

Allyn Walsh¹, Val Wass⁶, Victor Ng³, Roar Maagaard⁴, Marcelo Demarzo², Sam Merriel⁵, William Watson⁷

¹Wonca Working Party on Education

²Department of Preventive Medicine - Federal University of Sao Paulo, Sao Paulo Brazil

³College of Family Physicians of Canada Toronto Canada

⁴University of Aarhus, Centre for Medical Education, Aarhus Denmark

⁵Centre for Academic Primary Care, School of Social & Community Medicine, University of Bristol, Bristol UK

⁶School of Medicine Keele University, Staffordshire UK

⁷Department of Family and Community Medicine, University of Toronto, Toronto Canada

Justification:

Wonca's Working Party on Education has a focus on developing useful tools to enhance family medicine education around the world. In 2012, a checklist of essential experiences for medical students in a family medicine placement was published. Wonca Global Standards for Postgraduate Family Medicine were approved 2013. Since then, these standards have been used to enhance family medicine training globally. More recently, standards in Continuing Professional Development are under development along with further recommendations for Basic Medical Education. The goal of this session will be to engage participants in further developing these tools and their use in our diverse educational and clinical contexts.

Content:

At the end of the workshop participants will have:

- Shared experience of Family Medicine Education and identified skills they bring to enhancing its development internationally
- Identified and shared specific challenges for developing and quality assuring international medical education programmes

- Shared experience of educating across the continuum of medical education (undergraduate, vocational/postgraduate training, CPD) and the lessons learnt
 - Identified the principles of quality assurance frameworks/ tools to address some of the challenges identified for enhancing medical education
 - Identified strategies for enhancing medical education in FM in their own countries,
- There will be a brief presentation on each of the Wonca-developed tools including their adaptation to local contexts. Participants will break into several groups for interactive discussions to discuss them, and provide suggestions for further development. Participants will share perspectives on how these tools could be used in their contexts as well as other strategies for success.

Keywords: Education, Undergraduate, Vocational, Postgraduate, CPD, Quality Assurance

Communicating in Difficult Situations

Basem Roberto Saab, Nisrine Makarem
American University of Beirut, Beirut, Lebanon

Family physicians encounter in their daily practice difficult patients. The prevalence of having a difficult patient varies from 15-30%. This variation is attributed to more than one factor like physician, patient and environmental causes. Physicians who develop good communication skills are more likely to handle difficult patients better. In this workshop the facilitator will describe the C.O.N.E.S strategy that helps you in dealing with an angry patient. The format is variable. The workshop will start with an interactive power point presentation of 11 slides, followed by comments on a DVD clip, then a role play and will conclude with comments on another DVD clip. The whole session is expected to last one hour.

Competing interest: None

Keywords: Communication Skills, Difficult Patient, Angry Patient

WS-054

Multimorbidity in family practice – educational needs”

Ruth Kalda¹, Jáchym Bednář², Elena Frolova³, Francesco Carelli⁴

¹Department of Family Medicine, Tartu University, Estonia

²Department of General Practice, Charles University Prague

³The North-Western State Medical University named after I.I. Mechnikov, St-Petersburg, Russia

⁴Milano, Italy

Background.

A 2007 study from the UK showed that approximately 80% of patients aged 50 years and older in the primary care setting have multiple health problems. Despite the increasing numbers of patients with multimorbidity, the delivery of care is usually built around one single disease. Guidelines are derived from studies that often exclude patients with multimorbidities. The studies highlight difficulties of managing multimorbidity in family practice. The amount of educational literature about patients with multimorbidities is very limited. However, findings indicate that recognition of the significance of multimorbidity in family practice is growing. Clinicians need a management approach that considers the challenges particular to each individual, including patient preferences, goals and prognosis.

Aim of the workshop.

Identifying the most challenging areas of clinical practice in the case of patients with multimorbidity.

Methods of the workshop. The workshop will start with a small presentation about clarification of the terms and importance of multimorbidity in primary care setting. After this participants will be divided into small groups (5-6 people) to discuss on a case-vignette on a preestablished structured way. The groups are organised so that in each there are some younger and some more experienced FDs. These groups will be asked to identify the most problematic areas in working with patients with multiple diseases as well as components of good practice to overcome these problems.

Results and Conclusion. At the end of the workshop the participants are more aware about the complexity of the multimorbidity and know more about their personal learning needs related to this challenging topic.

Keywords: multimorbidity, vignettes, educational needs

WS-055

Learning needs for cultural competence in family medicine, so to develop a teaching curriculum in culturally responsive healthcare for medical education in Europe

Jachym Bednar¹, Ruth Kalda², Elena Frolova³, Francesco Carelli⁴

¹Department of General Practice, Charles University Prague, Czech Republic, EURACT

²Department of Family Medicine University of Tartu, Tartu, Estonia, EURACT

³St. Petersburg Medical Academy for postgraduate Study Department of Family Medicine, St. Petersburg, Russia, EURACT

⁴University of Milan, Milano, Italy, EURACT

BACKGROUND:

Cultural competence is a set of behaviors, attitudes, and policies that come together in a system and among professionals that enables the system or the professionals to work effectively in cross-cultural situations. It is an important skill because it reduces disparities in health services and increases detection of culture-specific diseases. Adoption of cultural competent behaviour is a lifelong continual process starting from sensitivity and awareness leading to knowledge and skillful practice. At the present time, in Europe, no universal professional training and curriculum in cultural competence exists. It is dealt with significant differences across the European

Union.

Aim of the workshop:

We let participants to be aware of what cultural competence is to think over and summarize in 1,5 hour workshop their learning needs in GP, so to work out a future model as teaching curriculum in culturally responsive healthcare.

Methods of the workshop: Participants will be split into three groups and each group will be asked to make up learning needs for one of three target groups they choose (group at BME, ST, CPD/CME level) describing besides the learning objective of the WS (according to adoption of cultural competence in level of awareness knowledge or skill - they choose the level too: also methods, tools, used materials and resources,). The groups will present the results to the others.

Results and CONCLUSION:

After the workshop participants are more aware of their learning needs and as well as colleagues' ones and through learning cultural competence they are more interested to be involved also in teaching and developing of the model of culturally responsive healthcare in their countries. Together with WONCA SIG - Migrant Care EURACT group would like to develop teaching curriculum in culturally responsive healthcare for medical education in Europe.

Keywords: education, cultural competence, culturally responsive healthcare

WS-056

Reviews - Are there different types?

Mary G Kearney¹, Mary M Hanratty²

¹Cochrane Collaboration, Cochrane Neuromuscular Disease Group, London, England

²Irish College General Practitioners, Dublin, Ireland

OBJECTIVES:

Before changing your practice in the light of a recently published review it is important to decide if the review is valid. i.e. Did the author just use his friends studies in the review? Is it an objective review? Every year, researchers and scientists publish more than three million new articles in scientific journals, It has been estimated you would need to read 20 articles every day just to stay on top of their field. These articles range from background information, expert opinion, case series, case controlled studies, cohort studies, randomised controlled trials, critically appraised topics to systematic reviews.

To explore different types of reviews

To critical appraise papers which are used in reviews

To look at the framework of Cochrane systematic reviews

MATERIALS - METHODS

Discussion with participants initially about how they keep up to date, what they do when faced with a difficult clinical problem, what journals they read.

CASE:

Two abstracts from different sources on the same topic will be given to participants. The European Heart Journal article on "Cardiovascular disease in women: a statement from the policy conference of the European Society of Cardiology" and the systematic Cochrane review on "Hormone therapy for preventing cardiovascular disease in post-menopausal women.

RESULTS:

Participants will be able to assess which review is most helpful to them. Did the review:

- 1) obtain all studies on the research question,
- 2) minimize bias,
- 3) pool the results of small studies in meta-analysis,

4) help resolve contradictory findings among different studies on the same question.

CONCLUSION:

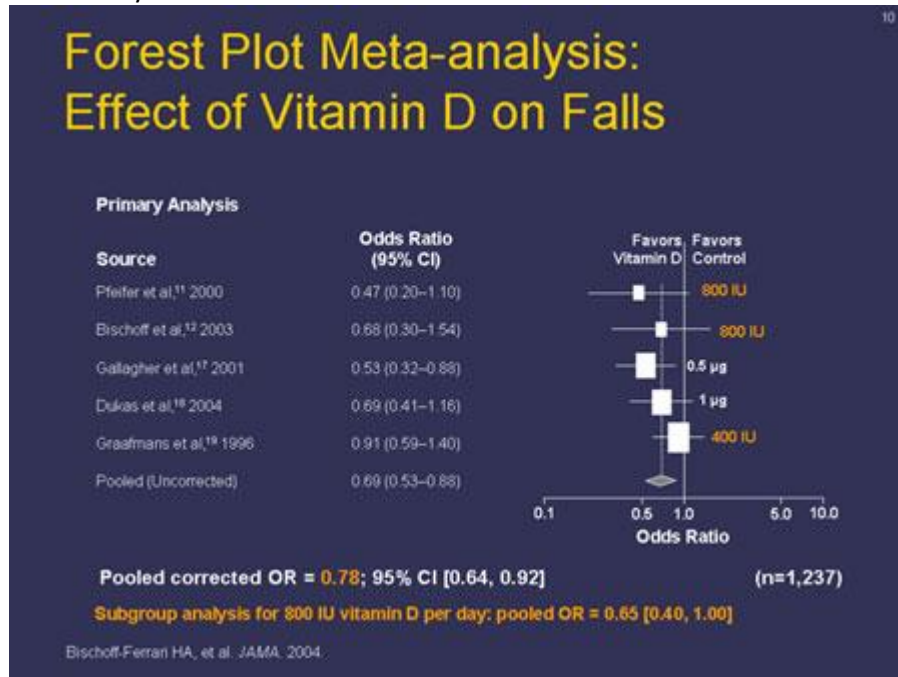

Obviously this will be decided on the day but I suspect that participants will find systematic reviews differ from narrative reviews as they use a very structured approach, explicitly formulated, reproducible, are constantly updated.

DISCUSSION:

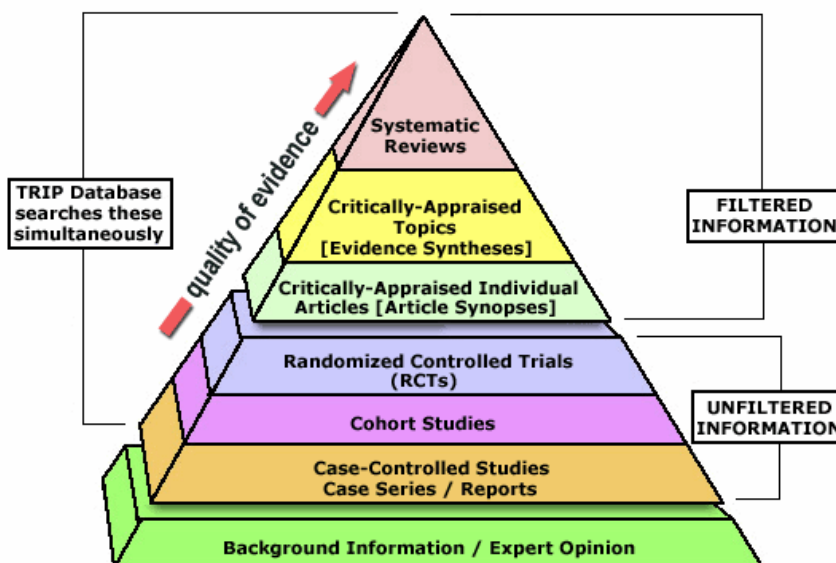

Will participants will be able to access Cochrane reviews freely.

Keywords: Review, Bias, meta-analysis

Meta-analysis

Identifying expert family medicine teachers in Europe using work based appraisal – EURACT education workshop

Adam Windak¹, Justin Allen², Jo Buchanan², Roar Maagaard³, Ruth Kalda⁴, Manfred Maier⁵, Janko Kersnik², Tomasz Tomasik⁸, Igor Svab⁶, Katarzyna Dubas⁷, Niels Kjaer³, Violetta Kijowska⁸

¹Jagiellonian University Medical College, Poland

²European Academy of Teachers in General Practice and Family Medicine (EURACT)

³Danish College of General Practice

⁴University of Tartu

⁵Medical University of Vienna

⁶Institute for Development of Family Medicine, Slovenia

⁷ZiZ Education Centre, Poland

⁸College of Family Physicians in Poland

Justification

EURACT and its project partners have previously developed a framework for the continuing professional development of teachers in family medicine in Europe by promoting the acquisition of expertise in the teaching of family medicine. The Leonardo EU project provided specific training courses aimed at teachers from novice to expert. A new project is now looking to develop the instruments that could be used to appraise levels of teaching expertise in individual countries. This process will help to harmonise European teaching and improve family medicine programmes.

Learning goals

During the workshop participants will gain an understanding of:

- the appraisal of levels of expertise in general practice teachers
- the characteristics of competent and expert teachers
- the appraisal instruments that might be used to identify these
- how this process might impact on their own personal development as teachers

Session description

The workshop will start with a 5 minute presentation from the project director, introducing the workshop and briefly describing the work so far, followed by a 5 minute description of the types of evidence teachers might need to produce, This will be followed by a 5 minute question and answer session.

There will then be small group work. Groups will be formed randomly, each facilitated by a EURACT leader and each should appoint a rapporteur. Each group will have 30 minutes to discuss the types of evidence suggested for one domain at either competent or expert level. Discussion will be for thirty minutes. The workshop will end in plenary discussion, with targeted feedback from the rapporteur of each group, strictly limited to 3 bullet points in 3 minutes. Finally there will be a summing up by the Project Director

The workshop will last 75 minutes, and evaluation will be through a brief paper evaluation.

Keywords: Appraisal of GP teachers, EURACT, Framework for CPD of teachers

WS-058

Tips on Managing Students in your Rural Practice

Christos Lionis¹, Janko Kersnik², Zalika Klemenc Ketis³, Gunta Ticmane⁴, Lars Agreus⁵, Elizabeth Swensen⁶, Jose Manuel Lopez Abuin⁷

¹Clinic of Social and Family Medicine, School of Medicine, University of Crete, Greece

²Department of Family Medicine, Medical Faculty, Maribor and Ljubljana University, Slovenia

³Department of Family Medicine, Medical Faculty, University of Maribor, Slovenia

⁴Department of Family Medicine, Riga Stradins University, Latvia

⁵Department of Neurobiology, Care Sciences and Society, Karolinska Institutet, Sweden

⁶EURIPA Member, Norway

⁷EURIPA Chairman, Spain

Justification

Rural practice presents a valuable resource for teaching medical students key concepts of family medicine for practicing medicine in general, i.e. comprehensive, holistic and patient oriented medicine. By teaching one to one in rural practice settings, students can gain skills and attitudes needed for future doctors.

Content

The workshop entitled "Tips on Managing Students in your Rural Practice" with participants from at least five European countries, including Greece, Latvia, Norway, Slovenia and Sweden aims to present and discuss students' experiences across these distinct settings. It will focus on students' attitudes towards rural medicine and the exchange of different experiences in rural practice, through interactive discussions and small group exercises. Barriers for larger students' involvement in rural practice teaching will be identified. In addition, formative assessment tools and feedback methods will be presented. The role of clinical preceptors and tested students' programmes in rural practice will be discussed, while certain propositions will be summarized at the end of the workshop and future actions will be planned.

Keywords: rural practice, medical students, family medicine

WS-059

Balint Group Work-Reflective Practice in Action

David Watt, Ceri Dornan

Dr David Watt, President Balint Society UK, London-affiliated to International Balint Federation,

The workshop will consist of a Balint group, led by myself and a colleague, both very experienced, accredited International Balint group leaders. Depending on numbers, all the participants may be in the group, or some will participate in the group, and some observe the group.

Justification and interest

The relationship between GP/family doctor and patient is essential for the practice of holistic medicine. There is a need for a reflective space for health workers where they can think about and discuss these relationships, in a safe and confidential environment. The Balint group has provided such a space for more than 60 years. It can contribute to resilience in the practitioner which may help prevent burnout.

The workshop will be of interest to GPs/family doctors in primary care. Previous knowledge of Balint groups is not essential.

Participants at Wonca meetings may come from countries where there is little or no Balint work taking place and so we can provide an opportunity otherwise absent.

Learning goals

Participants will experience and understand a Balint approach.

Participants will have an increased understanding of some of the issues which may arise in doctor/patient relationships and how these can be thought about.

Participants will be encouraged to develop their reflective capacity.

Method

The workshop will be experiential, using the Balint model. Participants will be invited to participate in, or observe, a live Balint group. We will then encourage participants to examine the approach and reflect on the possible usefulness and limitations in their own work.

Expected impact on participants

The Balint approach is a powerful way of exploring relationships. Participants will become aware of the importance of considering both sides of a relationship, including the emotional impact, within the contained and safe framework of Balint work.

Keywords: reflective practice, group work, education, psychology, relationships, resilience

WS-060

Starting your Own Balint Group

David Watt, Ceri Dornan

Dr David Watt. President, Balint Society UK, London- affiliated to International Balint Federation

This workshop will compliment my other workshop-Balint Group-Reflective Practice in Action.

Its aim is, through presentation and group discussion, to help doctors to found new Balint groups, either in areas where there is already Balint activity, but more particularly, in countries where no Balint groups exist. Wonca meetings, as in the past, are a place where doctors from many countries get together, and may access the work of the International Balint Federation.

In the UK, I work with many doctors graduated in countries without Balint work, and it appears there is a real appetite for the discussion of the doctor/patient relationship in all medical communities-for instance a Chinese Balint society has been founded in the last 2 years!

Through discussion and information sharing, I hope to be able to help participants proceed from a desire to be in a Balint group, to a position where they feel able to start one in their own community, with international support if needed through the International Balint Federation. Founding a new group, particularly in an area where reflective practice may not be fully part of medical practice, is daunting and depends both on the enthusiasm of the participants, but also on gaining institutional recognition/support. We can also help participants to access all the theoretical knowledge and experience they may need.

The desired outcome is a spread in reflective practice internationally, through the use of Balint Groups.

Keywords: Balint, group work, education, reflective practice, international co-operation.

WS-061

Developing WONCA CPD Standards: Engaging the WONCA Europe perspective

Victor Ng¹, Allyn Walsh²

¹Division of Professional Development and Practice Support, College of Family Physicians of Canada

²McMaster University Department of Family Medicine

Justification

Wonca's Working Party on Education has a focus on developing useful tools to enhance family medicine education around the world. Since 2012, a checklist of essential experiences for medical students in a family medicine placement and the WONCA Global Standards for Postgraduate Family Medicine has been developed by the Working Party. Since then, ways to use these standards to enhance the family medicine training have been under discussion.

Currently, one main focus of the WONCA Working Party on Education is the development of a set of Global Standards for Continuing Professional Development (CPD) to offer guidance on learning after the completion of a postgraduate training program. CPD is crucial to any family physician/general practitioners' career as a means to maintain and enhance competency and to facilitate a culture and expectation of lifelong learning. A strong commitment to CPD is quickly becoming an expectation of family physicians in many jurisdictions by our stakeholders including patients and physician licensing bodies. WONCA standards may provide a useful advocacy tool to engage with such agencies.

Content:

A short presentation of a draft version of the WONCA Global CPD Standards will be delivered. Similar to the WONCA Global Standards for Postgraduate Family Medicine, these CPD standards are largely based on the framework developed by the World Federation for Medical Education. Participants will break into several groups for interactive discussions to discuss and share their perspectives on various aspects of the draft document. The discussions and ideas generated will help to ensure that the WONCA European perspective is recognized and incorporated into the WONCA Global CPD standards.

Keywords: Family Medicine, Education, Continuing professional development

WS-062

Enriching the clinical dialogue by the aid of a conversational response model

Carl Edvard Rudebeck¹, Maria Yngvesson², Helena Bäckström², Henrik Nelson², Bertil Isaksson², Viktor Skobe³

¹Dep. of community medicine, Tromsø university, Norway and Research Unit Kalmar county council, Sweden

²The Dep. of primary care, Kalmar county council, Sweden

³Slottfjärdens Health Centre, Kalmar, Sweden

Justification

Patient-centeredness provides a structure for the consultation that counteracts the non-reflected dominance of biomedicine in the doctor-patient interaction, but the method does not tell about the dialogue as such. The Kagan-Wretmark (1979) response model distinguishes four dimensions of conversational responses; listening/not listening, explorative/non explorative, affective/cognitive and frank/glossing over, and includes also a few concrete advices that helps the doctor stay open end receptive. Integrated into the clinical repertoire through training and supervision, the response model helps the doctor guide the conversation on to a level where it finds its own dynamics, involving both patient and doctor in spontaneous interaction. Here, the doctor's spontaneity is the realization of the involvement in the patient's predicament. The danger of spontaneity is its being taken over by the doctor's self-interest. The doctor needs an active self-awareness to prevent this from happening. Detachment is also necessary for the doctor to take responsibility and pursue the tasks of the consultation in a structured way. Involvement and detachment go together (McWhinney 2000)

The authors have developed and practiced a course concept aiming at GP trainees, where the response model is built in into a GP context. We want to share our experiences with European colleagues, also inviting to a broader

discussion about education initiatives in the area.

Content

1. Presentation of the response model mainly by illustrating it by video-recorded interaction – 15'
2. Practicing the response model over a non-sensitive theme in groups of three and discussing the experience within the group – 20'
3. General discussion about the response model – 15'
4. What do we as educators do, and what could we do, to help medical students, trainees, and GP specialists become really good at interacting with their patients – 10' in the groups and 15' in plenary

Keywords: quality of doctor-patient interaction, training model, the doctor's self-awareness

WS-063

Graphic Medicine a valuable method of reflection for patients, clinicians, teachers and trainees

Linda Miller¹, Niro Amin¹, Fleur Navey¹, Rowena O'Brien¹, Stephanie Drymiotou¹

¹Sands End Health Centre, London, UK

²Queenstown Road Medical Practice, London, UK

³The Randolph Surgery, London, UK

⁴St Mary's Hospital, Imperial College, London, UK

⁵St Georges Hospital, London, UK

Justification; Graphic novels by patients and doctors are becoming increasingly popular. Reflective practice is recognised as a necessity for professional development throughout medical careers and for improving patient safety. The workshop will examine how additional insights can be gained from examining patient graphic novels and how graphic methods can be used to reflect on consultations, ethical dilemmas and teaching creatively. Creativity helps relieve stress.

Content

The workshop will consist of a brief introduction about reflection and its importance for professional development. Clinical governance structures within the UK require doctors and nurses to demonstrate reflection for appraisal and revalidation. Not all clinicians find it easy to document their reflection in writing. Graphic methods offer an alternative.

Workshop participants will be invited to share their experiences of reflective practice; for example how often they use reflective practice, what cases they tend to reflect on.

A short introduction to graphic novels, their structure, methods used and what makes them different from other forms of narrative will follow. Examples from patients, doctors, students and teachers will be introduced to demonstrate features of graphic novels e.g. structure, colour, size and metaphor.

Participants will then have an opportunity, in small groups, to reflect on a recent significant clinical encounter, experience as a patient, student or teacher and experiment with documenting this in a graphic form.

Small group facilitation will be by a multidisciplinary team from various settings and career stages, faculty and trainees. Three facilitators are doing postgraduate study/research in the Medical Humanities with the University of London. All have used graphic methods to reflect on their work.

Further resources will be supplied so that participants can develop their graphic reflection methods and share with others in their workplace.

Participant feedback will be collected.

WS-064

Using the arts in general practice/family medicine education: experiences and way to go ahead?

Mehmet Akman¹, Mladenka Vrcić Keglević², Hrvoje Tiljak³, Pemra Cöbek Ünalın¹

¹department of family medicine, Marmara university school of medicine, Istanbul, Turkey

²Foundation for the Development of Family Medicine, Zagreb, Croatia

³department of family medicine, A. Stampar" School of Public Health, School of Medicine, Zagreb, Croatia

Justification and Aim

Arts-based medical education was implemented for more than two decades to enhance aspects of professionalism including empathy, altruism, compassion, and caring toward patients, as well as to hone clinical communication and observational skills. Looking at the literature resources, family medicine has always been involved because of its deep roots in the provision of the contextually rich and patient-centred care. The aims of this workshop are to address the questions "Do we need arts-based education for general practitioners (GP) and if we do, what is theoretical and conceptual framework and what pedagogical tools can be used?"

Content

A panel of experts will be the GP's educator already incorporating arts into their teaching modules. The personal examples of using visual arts, poetry, prose, drama and films in "hard-to-teach" clinical competencies such as compassion, altruism, and empathy will be presented. It will be followed by the small-groups discussions on; a) the ideas how and when to introduce arts in everyday GPs teaching, b) ideas for the development of international research in the arts and medicine, based on the expert presentations and participant's personal experiences.

Conclusions

The workshop will allow participants to become familiar with the theoretical rationale for introducing arts exposure into GP's education; to participate in international dialogue identifying overlapping interests; to identify opportunities for collaborative educational and research projects in evaluation of arts-based curricular innovations as well as other aspects of the interface between the arts and medicine.

WS-065

Preparing trainees and their trainers for the GP care of the future: working with 'Entrustable Professional Activities' in GP training

Paul Van De Vijver, Kees Van Der Post, Marcel Reinders, Mirjam Nijvelt

Huisartsopleiding Nederland, Postbus 20072 3502 LB Utrecht, the Netherlands

In the Netherlands an updated National Curriculum is being developed that aims to guide both learning in daily practice and at the training institute. The training program for General Practice typically lasts 3 years and mainly consists of workplace learning, supervised by an experienced GP. One day a week trainees receive formal education from teachers at their training institutes.

The curriculum is built around seven 'key-competencies' (cf. CanMEDS) and, in addition, ten essential 'themes' in General Practice, which describe key domains of activities. Examples of themes are 'Care of the acutely ill patient', 'Care of the elderly patient', 'Care of the patient with psychological problems' and 'Preventive care'. Currently, for each of the ten themes 'entrustable professional activities' (EPAs) have been identified, using a Delphi-like procedure. As our curriculum aims at preparing GP trainees for 'GP care of the future', some of the EPAs involve activities which are not yet fully adopted into the 'average' General Practice. For the development of our profession, it is highly important that GP trainees and GPs work (and learn) together to incorporate these activities in their daily practice. GP training institutes should facilitate such collaborative learning.

Content

In this workshop, we will first give you an introduction into the value of working with EPAs. Next we'll provide you with an overview of our EPA's and let you identify EPAs that are relevant for your own daily practice and that are 'challenging activities' for both trainees and experienced GPs. Finally, we'll share ideas about just how the

collaborative learning of GP trainees and trainers can be stimulated and organized.

Keywords: education, GP training, EPA

WS-066

Movie Clips to Teach Medical Professionalism: from emotions to reflection and attitudes. A Faculty Development Workshop

Pablo Gonzalez Blasco¹, Olgun Goktas², Graziela Moreto¹, Rosana Irie¹

¹Sobramfa- Medical Education and Humanism, São Paulo, Brazil

², Uludağ University Family Health Center, Bursa, Turkey.

Emotions play a specific role in learning attitudes and behavior. Although technical knowledge and skills can be acquired through training, it is impossible to refine attitudes, acquire virtues, and incorporate values without reflection. Learning through aesthetics –art, literature, humanities- stimulates a reflective attitude in the learner. Cinema, as well, is capable of portraying a tremendous spectrum of attitudes required for building professionalism. Cinema is the audiovisual version of storytelling. Movies provide a narrative model framed in emotions and images that are also grounded in the everyday universe. They offer a quick and direct teaching scenario in which specific scenes point out important issues and emotions are presented in accessible ways.

Fostering reflection is the main goal in the cinematic teaching set. The purpose is not to show learners how to incorporate a particular attitude, but rather to promote their reflection. Reflection is the necessary bridge to move from emotions to behavior. As the audiovisual resources are permeating our current culture, opportunities for teaching with cinema are well suited to the learners' environment. Those "intangibles" issues difficult to teach and comprehended in professionalism could be endorsed through the cinema education methodology. The authors have developed the Movie Clip Methodology for more than fifteen years and want to share their experience. The learning goals are to understand the systematic strategy for preparing movie clips for teaching and how to use it for helping students to learn reflective practice. We expect an interactive discussion with the audience and a pleasant scenario to better understand how movies help in promoting professionalism.

Contents and Methods

1. Introducing presenters and asking the audience about their own experience in using cinematic teaching (20')
2. Showing movie clips. (20')
3. Getting feedback from the audience. (20')
4. Showing additional clips and generate themes identified by participants (20')
5. Summarizing: (10')

Keywords: Cinema, Professionalism, Reflective Practice, Medical Humanities, Faculty Development, Medical Education.

WS-067

Theatre of the Oppressed Workshop

Austin O Carroll, Patrick O Donnell
North Dublin City GP Training Programme

JUSTIFICATION: August Boal created Theatre of the Oppressed. He defined a power dynamic based on monologue rather than dialogue; a relation of domination and command that prohibits the oppressed from being who they are and from exercising their basic human rights. One of the ethical duties for doctors is to advocate on behalf of their patients. This duty is founded in the reality that many patients are in a disempowered position in relation to medical and social institutions and doctors who are in a more empowered position can advocate on their behalf. The dynamics of power and disempowerment due to oppression are complex, potent, ubiquitous and yet often submerged from our consciousness. On the North Dublin City GP Training Programme (which trains doctors to work in areas of deprivation and with marginalised groups) we use Theatre of the Oppressed to explore the concept of oppression and how to stand up to oppression/advocate on behalf of those who are disempowered.

CONTENT: The workshop will initially start with a number of movement; sound and interactive theatre exercises to help participants engage with theatre physically. Then participants will be split into groups asked to share stories of oppression that they have encountered as doctors or patients, or which they have observed occur for their patients. Each group will pick one story to dramatise. They will be helped develop the drama which will be then shown to the audience. Theatrical techniques will be used to engage the audience into participating and exploring the nature of oppression displayed in the story and how to counter that oppression. The workshop will finish with a short discussion about oppression.

Keywords: Ethics/Medical/Education

WS-068

Workshop on Addressing the Inverse Care Law: Innovative teaching on working in areas of deprivation and with marginalised groups

Austin O Carroll¹, Patrick O Donnell², Fiona O Reilly¹, Suzanne Barror¹, Cathy Cullen¹, John Latham¹, Louise Malone¹, Anne Macfarlane², Neasa McDonagh¹, Ming Rawat¹

¹North Dublin City GP Training Programme

²Partnership for Health Equity

JUSTIFICATION: It is known that people from lower socio-economic groups have shorter life expectancies and higher burdens of multi-morbidity. Yet the ratio of GP's to patients in areas of deprivation in Ireland is 1:2500, versus 1:1600 nationally. This confirms the Inverse Care Law as described by Tudor Hart. It is also known that marginalised groups have the worst health indices of all, and often have difficulty accessing primary care. This presentation describes two linked educational initiatives: an undergraduate teaching programme seeking to create awareness of these health inequities and the new North Dublin City GP Training Programme designed specifically to train GPs to work in areas of deprivation and with marginalised groups.

CONTENT: The design of an undergraduate module for teaching medical students about health inequities and working with marginalised groups will be described. Interactive cases and clinical dilemmas form the basis of this work. We will then speak about the GP training programme and its unique curriculum that includes (i) a focus on social medicine throughout (ii) using Mindfulness Based Stress Reduction and Balint groups to avoid burnout (iii) advocacy and professionalism training (iv) working on Special Interest posts in prisons, homeless, migrant and drug treatment services. The scheme champions the contact hypothesis, an educational theory proposing that stereotypes can be shattered by meeting people from marginalised groups. The first cohort of trainees on this scheme graduated in 2014. Videos of trainee feedback on the special interest posts will be shown. Results of written feedback from these registrars will also be presented. This programme had a direct impact on the GP trainees, but also on training across Ireland. The Irish College of General Practitioners requested that a Social

Medicine module for the national curriculum be created by this training scheme. We feel the models described could be replicated elsewhere.

Keywords: primary care, education, socioeconomic factors, accessibility of health services,

WS-069

Developing a Scientific Network for Young General Practitioners: Opportunities and Obstacles – the Danish experience

Ulrik Bak Kirk, Mads Dannesbo, Christina Svanholm, Gazelle Maghsoudi, Karolina Lewandowska

Forum for Young General Practitioners (FYAM), Denmark

Background

Since 2012, the Forum for Young General Practitioners (FYAM) in Denmark has conducted member-oriented campaigns with the aim to stimulate commitment and activity amongst its members. The main goal of the campaign in 2012 was daily supervision.

In 2013, FYAM introduced its research campaign with an intention to strengthen the knowledge of and interest in Primary Care Research.

In 2014, FYAM launched its quality campaign introducing quality circles (QCs), small groups of 6 to 12 GPs and GP trainees who meet at regular intervals to consider their standard practice.

The aim of this workshop is to share the Danish experiences about developing a Scientific Network for Young General Practitioner, including the use of concept campaigns to attract and involve members, to motivate other GP trainees to either organize their own national network or how to enhance commitment and activity in existing ones.

Outline

Firstly, FYAM will briefly run through its organizational features and the three concept campaigns mentioned above.

Secondly, FYAM will break the participants into groups and have them contemplating on actual opportunities and obstacles for developing a national scientific network for Young GPs, how to design the perfect campaign and sharing best practices about involvement of members nationally.

Thirdly, FYAM will ask the participants to dot evaluate the shape of the scientific network for Young General Practitioners in their respective countries.

This will be a nice mix of short presentations about the Danish experience together with a lot of interaction in groups about how to attract and involve GP trainees (in organizational work) across Europe.

Collaborating Groups and Length of Workshop

This workshop is done in collaboration with the Beyond Europe as well as the Quality Group within the Vasco da Gama Movement.

Keywords: Network, Young General Practitioners, Opportunities, Obstacles, Member-oriented campaigns

WS-070

Providence for a pilot program: A new class for medical students named 'Being Young, Staying Young'

Yesim Uncu¹, Züleyha Alper², Zehra Dağlı³, Canan Tuz⁴, Pınar Topsever⁵

¹Department of Family Medicine, Uludag University, Bursa, Turkey

²Department of Medical Education, Uludag University, Bursa, Turkey

³Department of Family Medicine, Ankara University, Ankara, Turkey

⁴Department of Family Medicine, Başkent University, Ankara; Turkey

⁵Department of Family Medicine, Acıbadem University, Istanbul, Turkey

Justification

Healthy lifestyle is a cornerstone of non-communicable disease prevention. In order to get older in a healthy way, youth should get the knowledge of staying healthy and it is known that lifestyle habits can be transferred into professional practice. Understanding the importance of healthy lifestyles as well as the adoption of active sports habits is especially important for students of Medical Schools, who will be knowledgeable managers of the future and architects of health. Not only is important for medical students to understand the skills of healthy life styles, also it is essential to bring up them as a role-model for the society in terms of their own lifestyles.

Various studies have shown the efficiency of a well-defined and structured education of lifestyle medicine. For this reason, we thought that preparing a healthy lifestyle module for medical schools is good point to start.

Aim of the workshop:

- We want to exchange different experiences on physical activity and healthy lifestyle habits of medical students between participants.
- We expect to found a working group to develop a program for healthy lifestyle for a medical school curriculum among the audience.

Content

The workshop will start with a small presentation of the literature about medical students and healthy life style. After summarizing the method of the workshop, feedback will be accepted for the format. The group will be divided in 4 small groups. Each group will work on a different topic (see below). In the last part all groups will make a presentation and all groups will work on a draft healthy lifestyle module in order to be used as a pilot program at medical schools.

TOPICS

1. Defining the goal of integrating the lifestyle module and the main topics
2. Determining stakeholders and infrastructure
3. Debate on students participation

Keywords: healthy life style, medical education, physical activity

WS-071

How to remain patient-centered while using Electronic Health Records (EHR)

Cédric Lanier, Melissa Dominicé Dao, Noëlle Junod Perron

Division of primary care, Geneva University Hospitals, Geneva, Switzerland

Justification:

Electronic health records (EHR) are now widely used in outpatient medical settings.

The EHR has shown to improve decision support and implementation of Evidence Based-Medicine, to improve the sharing of medical information and to reduce medical errors. The patients seem to readily accept the EHR even if there are few concerns about confidentiality.

However, some authors have shown a negative impact on the doctor–patient interaction. For example, EHR:

- Increases the moments of silence
- Decreases the doctor-patient interaction
- Decreases the interest for psychosocial problems of the patients

The doctors also experience difficulty remaining patient-centered while using the computer during the clinical encounter.

Content:

The goals of this workshop are to:

- 1) Understand that EHR changes the doctor-patient interaction.
- 2) Share the difficulties related with the use of EHR and review expert recommendations
- 3) Practice skills to help remaining patient centered while using EHR

This workshop will begin with a global discussion which will allow participants to report their experiences and difficulties related to the use of EHR.

Then, participants will observe and comment short videos of different styles of use of EHR in the clinical encounter Based on participants' observations, organizers will describe the experts' recommendations on how to use EHR in a patient-centered way.

Breaking into small groups for a role play, participants will practice segments of a general practice encounter with a computer, trying to integrate the discussed recommendations.

Groups will join again to share their experiences and comments regarding the role play.

Keywords: Electronic Health Records (EHR), patient-centered, communication skills

WS-072

Professional Identity Formation in medical education: implications for teachers

Pieter Barnhoorn, Chris Walinga

Leiden University Medical Center, department of Public Health and Primary Care, Leiden, the Netherlands

Justification:

Recently the new concept of 'Professional Identity Formation' has been added to the professionalism discourse. The concept of Professional Identity Formation complements the concepts of professionalism and professional behaviour by incorporating transformative aspects in education. Doctors not only need to behave professionally (focus on professional behaviour) or have the right character traits (focus on professionalism), they need to become professionals (focus on Professional Identity Formation. This new perspective may have important implications for medical education. This workshop will explore both the essential differences between the concept of Professional Identity Formation and the concepts of professionalism and professional behaviour and what are the implications for learning and educational design.

Content:

First we will discuss our experiences with professionalism and professional behaviour in small subgroups. The most important aim of the discussion is that participants become aware of which place these concepts have in our medical education practice. Then we will present a brief overview of the theory of Professional Identity Formation and how it complements the concepts of professionalism and professional behaviour. Hereafter we will discuss the implications of this new concept for learning and educational design. We will round up with a discussion and formulate ideas and practical plans how we can embed these plans in our daily practice.

Keywords: professional identity formation; professionalism; professional behaviour; medical education

WS-073

Experience based learning during the family medicine clerkship: Are you experienced?

Chris W. Walinga, Pieter C. Barnhoorn, Marieke H. de Jong

Department of Public Health and Primary Care, Leiden University Medical Center, Leiden, The Netherlands

Justification:

Burnout has a high prevalence among interns and can lead to illness, non-attendance or even quitting medical school. Factors associated with burnout are high workload, feelings of failure, impressive patient cases and exposure to unprofessional behaviour. Burnout itself again can give rise to unprofessional behaviour.

Experience based learning is a method that can facilitate discussing experiences among interns during clerkships that may lead to burnout and helps them to reflect on, analyse and learn from these experiences.

The method of experience based learning is challenging for both student and teacher. Students are often not familiar with concepts of active listening and easily step into common pitfalls. Teachers need skills to oversee and facilitate the process, encouraging students to be active listeners.

Introduction of experience based learning during clerkships supports discussion of professional behaviour and may prevent burnout and provide tools for future career.

Content:

First participants will discuss their own experiences in small subgroups to form ideas on how learning from practice is implemented in different medical schools throughout Europe.

Subsequently the principles of experience based learning and the learning goals we have formulated for our family medicine clerkship will be presented concisely. Also a short video recorded at our department will be presented followed by the outcomes of an evaluation survey held under our interns.

Finally, again in subgroups, participants will have the opportunity to practice skills needed in the role of teacher or intern. A real case, based on the experience of one of our interns, will be subject of discussion.

Keywords: experience based learning; medical education; professional behaviour; professional burnout;

WS-074

Genetics on Primary Care

Sara Almeida Magalhães, Susana Reis Gonçalves, Sónia Lima Costa

Department of USF Ponte, Guimarães, Portugal

Justification and interest of the workshop:

According to some studies Primary health care providers (PCPs) are uncertain about Genetic knowledge not only because of lack of confidence but also because of absence of guidelines to screen for genetic risks.

Besides the rising demand for genetic health care, education and training in basic genetics is still very low. PCPs require training for the refinement of specific skills such as family history-taking and use of referral guidelines.

Undoubtedly, family history represents a strong risk factor in many diseases and PCP's are the most well positioned doctor to provide it, however it is important to know what types of family clues on family history-taking are needed to chase.

Do you know that 10% 1 of consultations have genetic aspect? Mostly multifactorial disease like cancer and cardiovascular disease have genetic component. How important is the reproductive hemoglobin disorder? A referral to a genetic service can cause undue stress and anxiety for the patient and his/her family. So it is essential to know what cases really worth this submission. Management of low- and moderate-risk patients and support of families with/ at risk of genetic conditions are duties of primary care setting. The Primary Health Care is the gateway to the health-care system, so family physicians should provide more information about Genetics.

Methods Practical workshop through images of some syndromic characteristic and genetic clues of family history on Primary Health Care.

Expected impact on the participants Participants will learn basic knowledge about genetic clues to referral for Genetic Services and interpret some pictures as syndromic. Providing self-confidence and sensitizing on genetic fields in order to change their clinical attitude at primary care.

WS-075

the family's syndrome with psychodrama and sociodrama techniques

Hadiye Küçükkaragöz¹, Tolga Nasuh Aran²

¹Deü Education Institute Family Counseling And Education Department

²Meb Counselor

According to the family's syndrome theory some diseases, accidents and deaths are caused by the intergenerational transfer of some issues unresolved.

our grandparents's life can directly affect us decades later. We are links in a chain of generations, unconsciously affected by their suffering or unfinished business until we acknowledge the past. Schutzenberger says the name the Ancestors Syndrome.

Unresolved trauma has afflicted a family through an event such as murder, suicide, death of a mother in childbirth, early death of a parent or sibling, war, natural disaster, emigration, or abuse.

this workshop in psychodrama and sociodrama techniques will be used.

we have a small presentation about ancestor syndrome and Schützenberger and techniques.

maximum of 22 people will be working with.

Everyone should participate actively in the work of the group

Keywords: Syndrome, Family, Constellation, Transgenerational

Red Roses Writing about then Learning from Encounters With Patients

Alec Logan¹, Matt Burkes², Deborah Swinglehurst³, Khairat Al Habbal⁴, Janice Crofts⁵

¹Dept of General Practice, University of Glasgow, Scotland, UK

²Dept of General Practice, University of Brighton, England, UK

³Dept of General Practice, Univeristy of London, UK

⁴American University of Beirut Medical Center (AUBMC), Lebanon Department of Family Medicine

⁵MRCGP, GP and educationalist, Lanarkshire, Scotland, UK.

KEYWORDS clinical consultation; narrative; reflective writing; professional practice

Red Roses is a series of twenty reflective vignettes, by eight UK family doctors, based on real clinical encounters with their patients spanning a period of twenty years. Part of a wider collection of writings taken from The Good GP Training Guide (Eds. A. Logan and M. Burkes. RCGP Publications, 2014). The vignettes illuminate the mystery and intimacy of clinical encounters in general practice, and the therapeutic value of personal doctoring.

The vignettes vary in style from levity to tragedy, encompassing anger, hope, despair and optimism along the way. The stories are unfailingly honest.

At WONCA Europe 2014 in Lisbon our Workshop focussed on Reading and Reflecting.

At WONCA Europe 2015 in Istanbul our emphasis changes to Writing and Reflecting. Participants should write their own personal vignette, and submit to authorial team in advance. To aleclogan@dial.pipex.com

We shall choose texts for discussion at Workshop.

At WONCA World 2016 Rio de Janiero we plan to run a workshop combining Reading and Writing around Red Roses. Perhaps with a Plenary – The General Practitioner as Witness. What is a Sinus?

At our Istanbul workshop, we shall discuss reflection on practice and consider the potential educational value of reflective writing as part of professional practice. We shall work with real examples. Written by participants. In small groups we shall discuss topics such as: international comparisons in practice; the nature of decision making in primary care; how the role of family doctor differs from the role of specialist; ethical dimensions of caring for patients; conversations with patients.

The workshop will conclude with participants in each small group identifying learning outcomes and sharing these within a closing plenary. This workshop will be of interest to family doctors, medical students and educationalists.

Alec Logan

Training clinical communication skills with simulated patients; sharing the Acibadem University experience

Pinar Topsever, Sirin Parkan, Demet Dinc, Efe Onganer
Acibadem University, Istanbul, Turkey

At Acibadem University School of Medicine, teaching basic clinical communication skills (e.g. history taking, physical examination), as well as, advanced communication skills (e.g. breaking bad news, managing difficult patient encounters, initiating behaviour change) is organized by simulated patient encounters in the advanced clinical simulation center, mainly within the first three years of undergraduate medical education. The aim of this workshop is to share experiences about training programmes using simulated patient encounters, discussing methods of recruitment, training of simulated patients, principles of developing simulated patient scenarios with colleagues, in the light of the constructive feed-back of medical students and simulated patients.

Keywords: simulated patients, medical education

WS-078

The role of training in a hospital setting during vocational training for General Practitioners in Europe

Johan Buffels, Eveline Boogaerts
Department of Public Health and Primary Care, KU Leuven, Leuven, Belgium

Introduction.

Recently we performed a survey among national delegates of the European Academy of Teachers in General Practice/Family Medicine (EURACT) about training in a hospital setting during the vocational training for future general practitioners (GPs). Data from 19 European countries show that any vocational curriculum for general practitioners/family doctors after Basic Medical Education (BME) contains a period of in hospital training. Little comparative work was found about the objectives, the outcomes and the assessment of this kind of education. Research question.

What are the properties of the training in a hospital setting for future GPs during their vocational training in different European countries?

Methods

A survey was sent by e-mail to all available national delegates of the EURACT board. The questionnaire addressed the following questions. Minimal and maximal duration of in hospital training for future GPs, definition of the learning objectives, assessment of the trainees, rotation between the different disciplines, and involvement of the GP faculty.

Results

The properties of the training in a hospital setting for future GPs show a large degree of variation between the European countries. The results will be presented as an introduction for a workshop at the WONCA Europe Conference 2015.

Proposal

To create a workshop during the WONCA Europe Conference 2015, in order to share experiences and to set priorities for a further research agenda about training in a hospital setting for future general practitioners/family doctors.

Keywords: hospital setting, vocational training, general practitioner, family doctor

WS-079

ICPC-3: Progress toward a new version of the International Classification of Primary Care

Ferdinando Petrazzuoli¹, Nicola Buono², Thomas Kühlein³

¹Department of Clinical Sciences in Malmö, Centre for Primary Health Care Research, Lund University, Malmö, Sweden

²Via Tartari

³Universitätsstraße 29

SUBJECT: Progress made toward ICPC-3

JUSTIFICATION: ICPC has become a standard classification tool to support primary health care in many countries. Where used, it has provided invaluable and previously unavailable data about the content and process of primary health care. But we have seen significant changes in the content of primary health care since its introduction, especially in the areas of multimorbidity and management of risk factors for disease. WICC has begun a major revision of ICPC, focused on preserving the simplicity and clinical utility of the classification while adding new components and concepts that capture the new content of primary health care.

CONTENT: We will include a mix of presentations and participatory sessions, with audience questions encouraged at any point.

Session 1: What is ICPC, and why is it so useful in general practice/primary care?

Session 2: Why ICPC-3?

Session 3: What are the main goals for the work on ICPC-3 (what do we need to make better)?

Session 4: What is the working process we are using to make ICPC-3, and what have we done so far (demonstration and participation).

PRESENTATION TYPE: WORKSHOP.

A mixture of short presentations (15 min each plus questions) and demonstration/participation (30-45 min). The overall session is best described as a workshop. We request a 90-minute session as a minimum, would prefer a 2-hour session if available.

Our main goals are:

(1) to help participants understand ICPC and the changes we plan to make

(2) to stimulate interest in using ICPC

(3) to actively participate in suggesting priorities for change, and ideas about how we can work more effectively to create the new version

Keywords: multimorbidity, management of risk factors, diseases

WS-080

Ethical dilemmas in General Practice- a workshop

Manfred Maier¹

¹Dept. General Practice, Centre for Public Health, Medical University of Vienna, Austria

²Wonca Working Party on Ethical Issues in General Practice

INTRODUCTION:

Since its foundation in 2000, the “Wonca Working Party on ethical issues in General Practice” regularly organizes symposia and workshops on clinical situations of everyday practice involving ethical dilemmas.

Goals:

It is the aim of the workshop to present recent situations involving ethical dilemmas as they occur regularly in General Practice / Family Medicine and to discuss their background and possible consequences for the patient, his/her family, the physician and the society in general,

METHOD:

The workshop will start with short presentations by the participants of situations demonstrating ethical dilemmas. The participants may then agree to select specific situations out of those presented, will split into small groups and will discuss the following issues using the examples selected:

1. The patient’s history and other factors, which resulted in the development of the particular ethical problem presented
2. The possible consequences of the situation for the patient and the physician
3. Possible solutions
4. What are the basic ethical principles demonstrated and challenged by this situation?

Expected outcome:

At the end, the results of the small group discussions will be presented to the audience. It is the goal of this workshop to increase the awareness for the relevance of ethical standards and attitudes as applicable to future medical graduates and General Practitioners and for influences upon these standards.

Time Frame:

The workshop will last 75 minutes.

Keywords: ethics, dilemmas, General Practice

WS-081

Clinical Research Methodology Workshop

Firdous Jahan

Department of Family and Community Medicine (FAMCO), Oman Medical College, Oman

Justification

An understanding of research is essential for all family physicians. A number of clinical research studies highlights the need for greater participation in research by physicians. Physicians face a variety of barriers with regard to participation in clinical research. Barriers to participation include lack of time, lack of resources, trial-specific issues, communication difficulties, conflicts between the role of clinician and scientist, inadequate research experience and training for physicians, and sometimes a scientifically uninteresting research question, among others. Strategies to encourage physician participation in clinical research include adequate training, research questions that are in line with physician interests and have clear potential to improve patient care, and regular feedback. This workshop aims to train clinician's about an essential elements of research methodology.

Contents

It begins with a broad overview of the clinical research and good practice in medicine. Subsequent sessions provide a stepwise guide to undertaking a research project, from posing a hypothesis through to writing the paper. The workshop has a strong interactive focus, and a mixture of topics such as Steps in the development of a research proposal, Setting hypotheses and formulation of objectives, Types of variables and scales of measurements, Types of research designs, Data Analysis, How to write manuscript and get your research published.

At the end participants will have gained a basic understanding of:

- Research Proposal
- Research Question
- Research Design
- Type of Data and Analysis
- Writing Manuscript

Practice Session

After an interactive power point presentation, small groups will be invited to write a proposal out line and present in front of participants for feedback.

Keywords: Research methodology, design, hands on practice, family medicine

WS-082

Workshop on Current status, issues, barriers, challenges and way forward for Primary Care Research globally and in Europe

Waris Qidwai¹, Mehmet Ungan²

¹Aga Khan University, Karachi, Pakistan

²EGPRN & WONCA Europe

Justification:

Primary Care Research is required to improve clinical services at primary care level. Data and scientifically sound interventions at primary care level are required to improve health of communities. Currently primary care research is gaining strength and attention of primary care practitioners and policy makers. We wish to conduct this workshop to look at current status, issues, barriers, challenges and way forward for Primary Care Research globally and in Europe.

Lead Persons: Waris Qidwai, Chair, WONCA Working Party on Research

Content:

Introduction..... 10 minutes

Seven groups to discuss Primary Care Research Strategies to improve Primary Care Research and come up with recommendations.... 30 minutes

Recommendations to be presented to larger group.....25 minutes

Summary/ Conclusions.....10 minutes

OBJECTIVES: To look at Primary Care Research Strategies to improve Primary Care Research

Strategy:

1. Participants will be identified and invited to represent seven WONCA regions
2. Ideally, a minimum of three participants per regional group will be identified
3. An overview will be given at the start of the workshop
4. Group work will involve dividing participants into seven groups. Each group will identify a moderator and a repertoire.
5. Each group will present to full group followed by discussion
6. Proceedings of presentation and discussion will be recorded
7. Conclusion will summarize the workshop deliberations
8. A manuscript based on proceedings will be published with all participants as contributors

Keywords: Primary Care; Primary Care Research; Family Medicine

WS-083

Research by New and Future GPs Incorporating the 2015 Vasco da Gama Movement Junior Researcher Award

Peter A Sloane¹, Persijn Honkoop¹, Harris Lygidakis¹, Ivana Babic¹, Ana Luisa Neves²

¹Vasco da Gama Movement (VdGM)

²European General Practice Research Network (EGPRN)

Justification

Since 2011, the Vasco da Gama Movement (VdGM) has promoted science among junior general practitioners who combine research with patient care. In our workshop we aim to provide an opportunity to discuss relevant research topics in small groups of people who are interested in similar topics.

In addition, we will award outstanding careers and ideas with the Junior Researcher Award. The award honours the best research idea of GP-trainees or junior GPs with up to 5 years working experience after graduation. The auditorium is invited to learn from junior champions in research. This workshop sets the stage for bringing together junior researchers and/or trainees, senior researchers with outstanding expertise and interested GP trainees to learn from each other in order to promote future careers combining general practice research and training. Linking senior and junior generations in general practice research is expected to promote exchange of ideas, methods and opportunities for funding and collaboration. Through this workshop European GP-trainees and junior GPs may become enthusiastic about a future lifetime career in research and practice.

Content

The workshop will contain two parts. In the first part we will divide the audience into small groups based on themes of interest. Thereby, people who are (interested in) doing in similar fields of research meet and can actively build a network and participate in knowledge transfer. In the second part three finalists selected by an international jury will present both their ideas for future research and their personal career. Every presentation will be followed by a discussion. In the end we will announce the final winner.

WS-084

A collaborative framework for European Primary Care Clinical Trials: first experiences

Catherine Friderieke Enters-Weijnen¹, Diederick E. Grobbee², Richard Hobbs³, Paul Wallace⁴, Nicolaas J De Wit², Stéphane Heijmans⁵, Miguel A. Munoz-Perez⁶

¹Primary Care Research, Julius Clinical, The Netherlands

²Julius Center for Health Sciences and Primary Care, UMC Utrecht, The Netherlands

³Department of Primary Care Health Sciences, Oxford University, United Kingdom

⁴NIHR, CRN, London, United Kingdom

⁵Research Link, Linkebeek, Belgium

⁶IDIAP Jordi Gol, Barcelona, Spain

Objective

Clinical trials in general practice care are necessary to guarantee the development and implementation of new therapies for the population at large. As pharmaceutical companies and legislation concerning research become more international, studies will need to increase in scale and scope, often spanning multiple countries. This will require to increase the international collaboration among primary care physicians aligning best practices related to drug research in general practice with colleagues from around the globe.

Methods

Important insights to implement clinical trials in the primary care setting more successfully will be presented during an interactive workshop. Various specialists in this field will share their experiences in collaboration among both academic and commercial European research organizations and networks. Quality issues, operational

insights, innovation and the added value of consortia will be illustrated with a number of ongoing collaborative studies. There will be ample room for questions and sharing of experiences among the participants.

Results

Participants can apply knowledge gained from this workshop to improve both the quality and the impact of their research involvement in daily practice. This workshop will be a platform where key researchers from different countries exchange experiences and facilitate the further development of an international collaborative framework to co-ordinate primary care trial activities across Europe.

Conclusions

Internationalization of clinical trials in the primary care setting can be rewarding and provides additional insights and learnings. International cooperation and collaboration between primary care research networks and academic consortia will facilitate this process.

WS-085

Writing for publication - meet the Editors!

Jelle Stoffers¹, Hans Thulesius²

¹Department of Family Medicine, Maastricht University, Maastricht, the Netherlands; & European Journal of General Practice

²Department of Family Medicine, Lund University, Malmö, Sweden; & Scandinavian Journal of Primary Health Care

Writing for publication - meet the editors! A workshop by editors of the European Journal of General Practice and the Scandinavian Journal of Primary Health Care.

Hans Thulesius (hansthulesius@gmail.com) is the National Editor for Sweden of the Scandinavian Journal of Primary Health Care. Jelle Stoffers (ejgp-jstoffers@maastrichtuniversity.nl) is the Editor-in-Chief of the European Journal of General Practice (EJGP), the official scientific journal of Wonca Europe.

BACKGROUND: Peer reviewed medical journals are important media for the publication of articles relevant to Primary Health Care and General Practice/Family Medicine, such as research papers, reviews of literature, clinical lessons, and opinion papers. They are the means to disseminate original research results and educational information, discuss available evidence and share experiences. However, many colleagues find writing and submitting a scientific paper a challenge.

OBJECTIVE: To provide participants with information about preparing a manuscript for medical journals.

Audience: Authors interested in research or medical writing and with little or no previous experience in publishing. More experienced authors are welcome to join this workshop to share their experiences.

METHODS: The workshop has the format of an interactive presentation. It focuses on the preparation and submission of research papers. Topics discussed are the basic structure, language and presentation of research papers, and common errors and how to prevent them. Furthermore, we address issues like: How to write a good Abstract? What is an informative Title? What should a Cover Letter look like? In addition, the peer review process is discussed. Optional topics: choosing the right journal, (dis)advantages of open access journals, authorship and potential conflicts of interest, or the organisation of your writing project.

Expected RESULTS: Participants will have received basic knowledge and practical advice (“tips & tricks”) on how to prepare an appropriate manuscript to be published as a research paper in a peer-reviewed medical journal.

Keywords: writing, publishing, medical journal, peer-review, research

WS-086

Integrating a Research Career into Practice

Eugene Yee Hing Tang¹, Victoria Welsh², Hannah Fox¹, Camille Gajria¹, Rakesh Modi¹

¹Institute of Health and Society, Newcastle University

²Research Institute for Primary Care & Health Sciences, Keele University

In an ever-changing primary care structure, it is now recognised by future General Practitioners (GPs)/Family Physicians (FPs) that primary care can offer the individual ample opportunities to expand their career horizons. Research in primary care is growing. Although there are a number of different avenues that both primary care trainees and early career family physicians could take to get into research, this is not always made abundantly clear to interested individuals. The aim of this interactive session is to highlight opportunities available and also to discuss research ideas with colleagues, including peer review and feedback.

Format

- Brief presentation on how GPs/FPs at all stages can get into research as well as the benefits and challenges one might face
- To split off into groups of 3 to think of a “research idea” relevant to primary care. This will then be presented to the rest of the audience in a one minute time slot
- Feedback will be given to each group by the audience/panel members regarding the research idea.

Keywords: Research, Portfolio Career, Academia

Recruiting healthy volunteers to clinical and epidemiological studies and receiving personal consent according to international and national regulations

Mumtaz M Mazıcıoğlu¹, Neşe Yeniçeri²

¹Erciyes University Faculty of Medicine Kayseri Turkey

²Muğla University Faculty of Medicine, Department of Family Medicine Department

Any comment about the situation of clinical and nonclinical situation in the field of Family Medicine must be based on comprehensive and well constructed trials. The fundamental contribution of these trials can be interpreted as providing basic scientific knowledge together with the opportunity of inter-parameter cause and effect analysis. Both type of these analysis are needed for effective consultation, prevention, therapy and rehabilitation practice of family physicians. No need to emphasise the power of self produced scientific knowledge for your own practice which would discriminate us; the family physicians from other disciplines. Both local or nation wide or international efforts to produce new scientific knowledge can be accelerated and empowered by easily accessible and useful international collaboration without any grant from any institution. A workshop constructed on certain research scenarios in which obtaining regulatory permission in accordance with international ethical principles together with a clear and strong consent procedure may contribute a lot for researchers in primary care. Critical evaluation of local and international regulations and ethical principles may be a significant base for our future.

Keywords: Research, primary care, ethics, regulations

WS-088

Staying young: empowering general practitioners and family doctors to reinvent their careers using the Theory of Optimising Professional Life

Lesley M Piko¹, Karen Flegg²

¹ACT Medicare Local Ltd

²WONCA Editor

Justification: This workshop builds on a similar workshop at Wonca Europe 2014 which highlighted the diverse and challenging career pathways available to family doctors. We will be following Australian research into how family doctors shape their careers and participate in primary health care. Data for that study comprised interviews with thirty GPs plus 2,255 survey responses and a new career theory occupation specific to family doctors was reported: the Theory of Optimising Professional Life. While they come from different generations and work in different social and cultural contexts, most doctors experience a need to reinvent their careers over time. This workshop brings together an international group of family doctors to reflect on their careers, share lessons learnt and explore how individuals adapt when faced with new challenges. The Theory of Optimising Professional Life provides a tool to guide doctors in developing their own long-term careers.

Content: The workshop, led by two facilitators, will include example career path stories and round-table discussions where participants will be expected to reflect on their own career path both past and future. Workshop participants will be given a framework to explore career development strategies and illustrate a variety of roles and career trajectories. This framework can be used to help family doctors understand issues they have in their career and empower them to sustain their interest over time and meet their personal needs for self care and income. This workshop offers a problem-focused approach to resolving career issues, an approach which has been found to help family doctors integrate work and life events and to influence family doctors' career satisfaction in general practice.

Keywords: career pathways, career mobility, career development

Do the women doctors have the equal opportunities for practice, research and leadership in family medicine in Europe?

Nil Tekin¹, Amanda Barnard², Amanda Howe³, Zorayda Leopanda⁴

¹Department of Family Medicine, Narlidere Residential and Nursing Home, Izmir, Turkey

²Rural Clinical School, Australian National University Medical School, Canberra, Australia

³Norwich Medical School, Norwich, UK

⁴Family and Community Medicine, University of the Philippines Manila, Philippines

Theme of the workshop: While the women doctors in the increasing number in Europe prefer family medicine, whether equal opportunities are provided to women for clinical practice, research and leadership or not is still discussed. Women can face with various barriers for clinical practice, research and leadership. It is known that various differences among the European countries are in question. At this workshop, opportunities provided to family physicians, barriers inter-countries differences will be discussed and solution strategies will be developed.

Learning OBJECTIVES: Presenting a general view about whether equal opportunities are provided to women family physicians in clinical practice, research and leadership in Europe or not, and ways of solutions for differences among countries and barriers.

20 participants from different countries. Women are particularly encouraged to attend.

Workshop limited to 20

Method 90-minute workshop

Part A- 1 hour interactive tutorial

The opportunities provided to women family physicians in family medicine practice, research and leadership in Europe and barriers will be discussed.

Topics are clinical practice, research and leadership.

The facts that increasingly more women doctors prefer family medicine, general view of opportunities and barriers as a woman family physician, showing the differences in various countries for woman family physicians

Part B: 30 minutes small group work session

Creating opportunities equally in all European countries and common solution strategies to overcome barriers will be discussed.

Expected RESULTS: The awareness of participants about barriers for gender equality in clinical practice, research and leadership as woman family physicians in Europe will increase and solution strategies will be created.

Keywords: 1- Woman family physician 2- Clinical practice 3- Research 4- Leadership

WS-090

Primary care as a strategy to tackle health inequity in Europe

William Wong¹, Sara Willems², David Blane³, Patrick O'donnell⁴

¹The University of Hong Kong

²Ghent University

³University of Glasgow

⁴University of Limerick

Background

Tackling inequities in health is a central policy commitment of most European countries. While many drivers of health inequities lie outside the healthcare system – education, employment, etc – it has long been recognised that health services can play an important role in either reducing or widening health inequities (1,2). Barbara Starfield has reminded us utilizing an effective primary care system is the key to ameliorate health inequities and improve the health of within a country's health system (2)

Goals

The main aim of this workshop is to highlight the potential of primary health care to reduce inequity in health. The workshop will give an overview of health inequity in Europe, with examples of how European and national programs focus on tackling inequity in health. There will be group discussion on the specific role of primary care in tackling health inequity, with reflection on some promising national and local initiatives.

This workshop will enable the participants to:

- Understand trends in health inequity across Europe and European primary care systems;
- Reflect on the role of primary care in reducing health inequity;
- Consider specific actions that can be taken to improve health equity, based on experience in different countries

Outline of workshop

- 1) Brief introduction to the Health Equity Special Interest group (SIG)
- 2) Plenary presentation on the current landscape of Health Equity in Europe, including results from the QUALICOPC study: How equitable are European primary health care systems?
- 3) Small group discussion on the problems, limitations and good practices of primary care in tackling health equity in the participants' countries
- 4) Defining "lessons learned" and wrap-up

References

- 1) WHO (2008). World Health Report - Primary Health Care <http://www.who.int/whr/2008/en/>

Quality Circles at a Glance – Use of Antibiotics in General Practice

Peter A Sloane¹, Christina Svanholm¹, Ulrik Bak Kirk², Adrian Rohrbasser²

¹Vasco da Gama Movement (VdGM)

²European Society for Quality and Safety in Family Practice (EQuiP)

Justification

Quality Circles, also called “peer review groups” are commonly used in primary care in Europe to reflect on and improve the standard practice over time. They represent a social intervention that may have the power to change clinical practice and facilitate the professional development of Primary Care. Controlled studies, reviews and other studies have shown positive behaviour change for those involved. There are currently an ongoing EQuiP study across Europe on “why” Quality Circles seem to be effective. The purpose of this workshop on Quality Circles is to make trainees and general practitioners get a glimpse of a method to increase focus on quality of care in cooperation with specialists from secondary care. The aim with this specific topic is that each participant will return to their own practice with greater awareness and knowledge about the use of antibiotics.

Content

- 1) The workshop will imitate a Quality Circle and the participants will be divided in to groups of 12 (ideally 6 trainees and 6 GPs)
- 2) The topic will be “Use of Antibiotics”
- 3) Two specialists will open the workshop with a short presentation on the topic and afterwards the groups will go through case-material from their own practice
- 4) Subsequently, cases and misc. material will be discussed in plenum with input from the specialists in plenum

Keywords: "Quality Circles", "Peer Review Groups", standards, quality, antibiotics

WS-092

Developing Resources to Facilitate Change Management in General Practice

Peter A Sloane, Claire Marie Thomas, Christofer Patrick Reichel, Yusianmar Mariani, Canan Tuz

Vasco da Gama Movement (VdGM)

Justification

The task facing general practitioners/family doctors is growing more challenging by the day due to changing and growing clinical demands and expectations, together with tighter economic conditions. Therefore, GP/FDs will have to find ways of doing more with the same - or even less - resources. Change is in order but, while doctors often recognise inefficiencies and challenges in current working practice, many will recognise frustration of not knowing where or how to start trying to tackle it!

#FMChangeMakers are a group of young family doctors from across the world, working together to generate and collate resources to empower their colleagues to engage in positive change management.

Content

Short oral presentation introducing the #FMChangeMakers Project and its origins at last year’s VdGM preconference in Lisbon.

Short presentation updating on the activities and progress of the first year of this exciting movement, highlighting it’s presence on social media.

Small Group Work to further explore our 4 flagship themes, with each group tackling a different theme: -

Professional Networking and Collaboration

Communication Skills & Patient Empowerment

Primary Care Focused Evidence & Guidelines

Image & Policy in Family Medicine

In the small groups participants will be asked to: -

Share their experiences in relation to the theme and impact on their practice

Explore barriers/challenges that may prevent change or progress

Identify resources and support mechanisms that may enable them to engage in and instigate change processes

The groups will then reconvene and share the outcomes of their discussions, reflecting on the potential of Family Doctors to engage in change processes at local/national and international levels and how this could impact upon patient care.

Finally we will invite interested participants to sign up to join a work theme should they desire to support the project: Join the #FMRevolution with #VdGMChangeMakers!

Keywords: #FMChangeMakers, Family Medicine, resources, collaboration, change management

WS-093

Quality in my practice. How do I start?

Piet Vanden Bussche¹, Andrée Rochefort¹, Piet Vanden Bussche², Andrée Rochefort³

¹EQuIP

²department of primary care UGent Belgium

³Irisch Collega of General Practitioners Dublin Ireland

A lot of people talk about Quality. GPs deliver quality, patients are entitled to quality and the government or the insurers expect quality. It is thought to be clear for everybody what it means. But it is different for everyone involved.

It is very important to make more explicit what quality means when you talk about it. A lot of experts tried to formulate a definition. What aspects are involved? But the mean message is that you have to define it yourself, for your own practice/ within your own organisation. How can we define quality in our own practice or organisation. And how can this effect the work we are doing?

In an interactive way participants will reflect on the topic. Define the quality for themselves and the group they are working in. Get insight in what quality is all about and be able to formulate a mission statement for their own organisation.

Target group for this workshop are people who want to learn the basics of quality improvement and how to work with it in their own practice or organisation. It will be practice based and daily work oriented. We want to limit the group to a maximum of 20 participants.

Keywords: Quality, general practice, practice based

WS-094

A Workshop on Significant Events in General/Family Practice (Primary Care): Analysis of the Good-The Bad-The Ugly

David G Moores, Bonnie Dobbs

Dept. Family Medicine, University of Alberta

BACKGROUND: Much of the research into health services quality and safety reflects the hospital or acute care environments. Primary Care, where the vast majority of clinical interactions occur in any health system (White et al), has depended on data, processes and perspectives that reflect the acute care/institutional reality. While there are parallels in the error/mistake/blame cultures between primary, secondary and tertiary care an important first step is to open the “black box” of errors, near-misses/crashes, misadventures and poor quality in family/general practice.

AIM: This workshop will provide an overview of the Quality and Safety in Primary Care programme in the Department of Family Medicine, University of Alberta. Participants will be introduced to the UK based “Safety in Primary Care” teaching modules by TVC. The aim is the development and enhancement of significant event analysis skills.

METHOD: Short presentations and small group work will focus on significant events, as identified by participants and supplemented with those from family medicine residents (registrars) during their clinical educational experiences Literature-based characteristics of family/general practice significant events will prepare participants for their small group work.

RESULTS: The development of educational objectives for quality and safety learnings and processes in primary care is an important first step. Changing the culture from one of reacting to such occurrences to anticipating them coupled with the dissemination of learnings is key to changing our culture

CONCLUSIONS: Significant Event Analysis in family/general practice (primary care) is essential and more encompassing of quality and safety issues when compared to Critical Incident Reporting and Analysis (hospital/acute care focus). Primary Care Quality and Safety is an emerging focus for postgraduate education programs in Canada. The sharing of information derived from this focus will advance the understanding of the unique issues in family/general practice quality and safety.

Keywords: quality, safety, significant event analysis

WS-095

Infection prevention in general practice; an unbridgeable gap between theory and practice?

Masja Loogman, Stijn Van Den Broek, Margriet Bouma

dutch college of general practitioners

Justification

Worldwide, there is an urgent need for reducing dissemination of infections associated with healthcare, in order to prevent the spread of pathogens. This includes the prevention of infections in general practice, where the prevalence of MRSA and other multiresistant bacteria is increasing and the health care workers even can be challenged with outbreaks of Ebola or highly pathogenic avian influenza.

In the Netherlands, the Dutch College of General Practitioners is developing a guideline infection prevention for general practitioners. The recommendations in this guideline are based on generally accepted principles. However, there's a big gap between the ideal situation in terms of infection prevention and the current situation in general practice.

Bottlenecks are the lack of support because there is little scientific evidence on the effectiveness of measures on infection prevention in general practice, some recommendations are time costly or not implementable in daily routine, some influence the contact between doctors and their patients, general practitioners do not experience many infections in their practice due to their own actions or interventions.

Organisation of the workshop

- Introduction
- Filling in a short questionnaire on the application of the main topics of infection prevention in the own practice
- Discussion in small groups on the results of the questionnaire (importance of the topics, bottlenecks in the implementation, possible solutions)
- Presentation of the main results in each group
- Plenary discussion

Results

The participating GPs are aware of and feel more prepared to deal with the problems of infection prevention in their practice.

The ultimate goal is to endorse quality promotion of health care which is safe for patients, health care workers, others in the health care setting and the environment, and to accomplish these goals in a cost-effective manner.

Keywords: infection, prevention, quality, recommendations

WS-096

Health inequalities related to socio-economic status: how primary care may reduce them

Hector Falcoff¹, Sara Willems², Piet Vande Bussche², Isabelle Dupie¹

¹Société de Formation Thérapeutique du Généraliste, Paris, France

²Department of family medicine and primary health care, Ghent University, Belgium

Primary care may contribute to increase health inequalities related to socio-economic status (SES) when the « inverse care law » operates, ie when the availability of good primary care varies inversely to the need for it in the population served. At the opposite, primary care may contribute to reduce these inequalities by delivering equitable care.

Learning goals.

- 1) Clarify the concepts: health inequalities, health inequalities related to SES, equity of health care...
- 2) Understand how primary care can increase or reduce these inequalities.
- 3) Identify patient SES informations important to register in the patient medical record, and understand the contribution of these informations to guide the consultation.
- 4) Understand how to improve the equity of primary care.

Methods.

- 1) Presentation of the concepts and mechanisms connected with health inequalities related to SES.
- 2) Small groups of 5-6 participants will work on the detailed narrative of a low SES patient with negative outcomes:
 - a. what could have been done, when, and by whom, to modify the outcomes;
 - b. what skills primary care providers, and particularly GPs, would have needed to act in this way;
 - c. what modifications of the practice organisation would have been necessary.
- 3) The groups will present a summary of their reflection.
- 4) An EQuIP expert will propose a synthesis.

Expected impact on the participants.

To motivate the participants to:

- 1) work on this topic;
- 2) adapt care to specific social groups needs
- 3) register systematically a limited number of SES standardized data on the patients' records, in a time efficient

way;

4) introduce stratification by social groups when measuring quality indicators;

5) implement plan-do-check-act projects to improve equity and to demonstrate the benefit for the patients and the practice.

Keywords: health inequalities, equity, patient medical record

WS-097

"Keep the Flame" Avoiding burnout and promoting happy doctors

Dimitrios Alepidis, Veronika Rasic, Alexandra Tsipou, Ivana Babic, Emna Zarrad

Vasco da Gama Movement

BACKGROUND:

The modern life style and the expansion of technology set constant pressure to doctors to work at the limits of their abilities. This may cause long-term exhaustion and diminished interest in work, commonly known as burnout, or to trigger other medical conditions related to stress. Burnout has been assumed to result from chronic occupational stress (e.g., work overload), and its symptoms are similar to those of clinical depression. Although it is widespread, burnout is not recognized as a distinct disorder, in the DSM-5, but it is included in the ICD-10, and can be found under Problems related to life-management difficulty.

Work/life balance is an important factor to consider as a preventive measure and it is often over looked in the education process. To take care of our patients we first need to know how to take care of ourselves.

OBJECTIVE:

If we consider burnout as a lifestyle induced disorder, raising awareness on this topic, may help young doctors to change their views on the subject and to reorganize their lives to reduce stress, promoting a happier and healthier life.

DESIGN:

The workshop will begin with a short PowerPoint presentation about burnout, its causes and its early signs (8min). After which the participants will be divided into small groups (6-8 persons) and they will have 5 rounds of 8min intervals (total 40min) discussing the issues of:

1. Motivation to be a GP
2. Motivation in their personal lives
3. Recognizing problems relating to everyday work
4. Ideas and techniques for stress management
5. Finding personal strong/weak points and how to use them in a creative way.

Finally, will be presented some examples of doctors that have found interesting ways to manage their work/life balance.

Keywords: Burnout, quality of life, happy doctors, lifestyle

WS-098

How can we make clinical decision support systems effective in general practice?

Derk L Arts, Henk C Van Weert

Department of general practice, Academic Medical Center, Amsterdam, The Netherlands

BACKGROUND: Clinical decision support systems (CDSS) have been around for many years but their effectiveness on patient related outcomes has yet to be proven. We studied the effectiveness of a CDSS in general practice and evaluated what barriers and facilitators influenced it's use in daily practice. This workshop will expand on those findings.

AIM: To identify and describe key elements that can make CDSS effective in primary care. Participants will get a better understanding of the possibilities of CDDS. The discussion outcomes will be used to formulate requirements that the ideal CDSS should meet to be effective in general practice.

Contents: The workshop will consist of a short presentation concerning the design and functions of the system we developed and tested in the Netherlands. We will start a group discussion in which we will discuss several topics that determine CDSS effectiveness: contents (what type of recommendation is best suited for CDDS), presentation (how should recommendations be displayed), timing (how can we integrate a CDSS in the GP's workflow) and other requirements (i.e. the ability to turn off alerts for certain patients). At the end of the workshop we will present our findings and compare them to what was discussed during the workshop.

Outcome: Participants will have gained knowledge and ideas from colleagues in the field and will have an understanding of how CDDS in general practice could be improved. Ideas and concepts will be summarized at the end of the workshop to create a short overview of key features and requirements that were discussed.

Keywords: decision support, general practice, improvement, guidelines, system, health informatics

WS-099

Patient safety in primary care: get started

Isabelle Dupie¹, Andree Rochfort²

¹Société Française de Therapeutique du Généraliste

²Irish College of General Practitioners

4.5% of hospital stays, in France were caused by adverse events (AEs). Over half of those AEs can be considered preventable.

Even if most of studies fail to estimate the incidence of adverse events in primary care, we know that patient safety is an issue as important in primary care than in hospitals.

It's time now to get primary care teams involved in risk management programs.

Learning goals

- 1) Integrate the definition of an AE in primary care
- 2) Experiment reporting AEs
- 3) Learn how an AE analysis can be performed in a group

Method

1. Clarify the definition of an AE

2. Presentation of the case of Mrs C. a frail 90 year old lady coming back home from hospital.

The facilitators explore several questions:

- o What is the adverse event in this story?
- o What are the dysfunctions?
- o What are the immediate and latent causes?

o Which barriers play a role? Which have failed?

3. Participants are invited to recall an AE occurred in their own practice.

4. The participants are split into groups of 3. Each participant tells his/her story. The other 2 participants listen. After discussion, each participant writes on a post-it note:

o what was the risk for the patient in the story

o the feeling(s) he/she had when telling their experience

o the feeling(s) he/she had listening to the others' story.

5. Facilitators pick up the stickies and read the feelings experienced while telling and while listening. The results are gathered on a paper-board

6. Participants discuss the results and give their reactions and opinions

Expected impact on the participants

- Discover that it is not so difficult to tell and discuss adverse event stories
- Motivate to enter in a current practice of sharing and analysing
- Engage into positive safety culture

Keywords: safety culture, adverse event, primary care

WS-100

Access, cost and quality: testing the 'iron triangle' of primary healthcare

Greg Irving¹, Sietse Wieringa², Luisa Pettigrew³, Stephanie Kumpunen⁴

¹University of Cambridge, Cambridge UK

²Queen Mary University, London, UK

³London School of Hygiene and Tropical Medicine, London, UK

⁴The Nuffield Trust, London, UK

Justification

Access, cost and quality – it is often said that in health care you can improve one or possibly two of these variables, but that this improvement must come at the expense of the third. For example, you could make health care cheaper and improve access but this will result in a reduction in quality of the care provided. Alternatively, you could improve access and the quality of care but this will come at increased cost. This 'iron triangle' makes an assumption of dependence between these three essential components of healthcare - but does relationship always hold true and if does (or does not) what are the implications for the future of primary care?

Content

The workshop will begin with a short presentation raising questions about what is actually meant by access, cost and quality in the context of primary care. Participants will then be invited to discuss healthcare policy decisions in their country and whether any trade-offs have taken place in relation to delivering access, cost and quality. High quality system level evidence from WONCA Europe member states will be used to support this debate. We will then empirically 'test' the iron triangle by comparing access, quality and primary health care spending and ask participants to consider the consequences of the findings for the future of Primary care in their own country.

Every year at the WONCA conference, Luisa Pettigrew, Greg Irving, Stephanie Kumpunen and Sietse Wieringa, Family Physicians and researchers with an international scope, explore a complex economic concepts and how they affects primary health care.

Keywords: Primary care, access, cost, quality

WS-101

Quality Indicators for Family Practice

Zekeriya Aktürk¹, Ebru Yılmaz²

¹Department of Family Medicine, Atatürk University, Erzurum, Turkey

²Sivas Akıncılar District State Hospital

The term "Quality" has an important impact in the life of family physicians. Different terms and concepts are in use: "Quality standards", "Quality control", "Total quality management", "Continuous quality improvement".

In this workshop we will present about the quality-related terms and discuss especially the use of indicators in family practice. With the contribution of participants we will define different indicators (infrastructure indicators, process indicators, clinical indicators, and outcome indicators) to be used by family physicians.

Keywords: quality, EQUIP, indicators, family practice

WS-102

How does coding support the key tasks of the GP and improve patient care?

Ilkka Kunnamo¹, Karen Kinder², Ferdinando Petrazzuoli³, Fernando Alonso Lopez⁴, Angel Ruiz Téllez⁵

¹Duodecim Medical Publications Ltd., Finland

²Bloomberg School of Public Health, Johns Hopkins University, USA

³Centre for Primary Health Care Research, Lund University, Malmö, Sweden

⁴semFYC, Spain

⁵CYMAP Ltd., Spain

JUSTIFICATION: Defining the key functionalities of electronic health records supporting the work of the GP was identified as a priority for the WONCA Working Party on eHealth (WWPeH) in a member survey. A wish for closer collaboration with the WONCA International Classification Committee (WICC) has been expressed by many WONCA members. An essential requirement of IT support for clinical care is accurate and complete coding of data. In the workshop we will address these expectations and show examples from 3 countries, followed by discussion on how coding should be used and developed.

CONTENT:

Ilkka Kunnamo (WWPeH): Introduction - coded data supporting clinical care (10 min). Benefits include support of clinical decisions and improved patient safety via decision support, automation of routine tasks, care coordination across the primary care team and specialized care, caring for the whole population by identifying care gaps and promoting equity, communicating with and empowerment of patients by sharing data and knowledge, and improvement of the quality of care by supporting professional development via analysis of process and outcome. Figure 1 shows the cycle of coded data flow in the care of individuals and populations.

Karen Kinder: Identifying high risk patients in NHS UK (10 min)

Angel Ruiz Téllez, Spain: Is it possible to promote excellence in general practice via computer-assisted coding? (10 min)

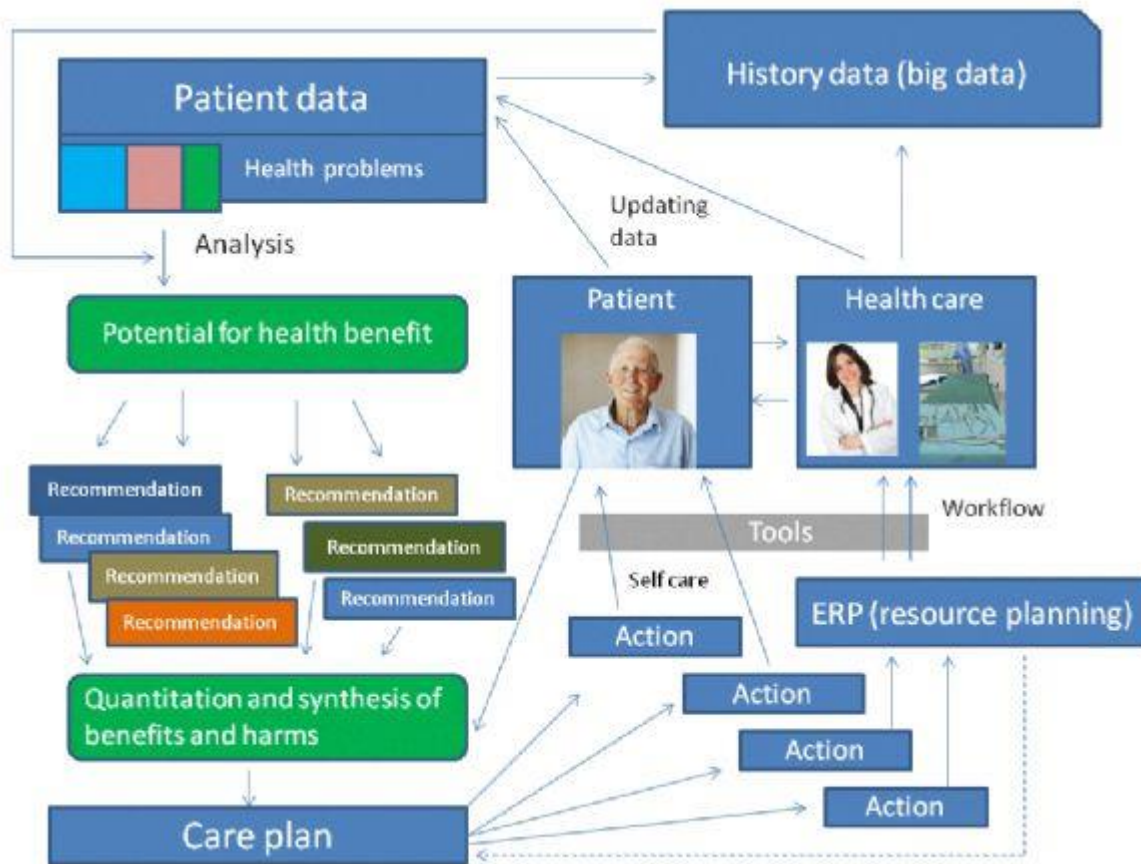

Ferdinando Petrazzuoli (WICC): The future of ICPC: parallel development (ICPC 3), inclusion in ICD-11 or mapping to SNOMED CT? (10 min).

DISCUSSION: one group for each presentation, facilitated by the presenters (20 min)

Reporting and agreement on the next steps (15 min)

The conclusions of the discussions will be published on the WWPeH website.

Figure1

Cycle of coded data flow in the care of individuals and populations

WS-103

Health Literacy: Finding the right words for better health

Fatma Goksin Cihan¹, Dursun Cadirci², Didem Kafadar³

¹NE University Meram Medical Faculty, FM Department, Konya, Turkey

²Harran University Medical Faculty, FM Department, Sanliurfa, Turkey

³Bagcilar Training and Research Hospital, FM Department, Istanbul, Turkey

Justification:

Health literacy(HL) is the degree to which individuals have the capacity to obtain, process, and understand basic health information and services needed to make appropriate health decisions. Besides basic literacy skills, HL requires knowledge of health topics. People with limited HL often lack knowledge or have misinformation about the body as well as the nature and causes of disease. Without this knowledge, they may not understand the relationship between lifestyle factors such as diet and exercise and various health outcomes. Inadequate HL may result in patient violence against health care professionals as they can misunderstand the interventions.

Health literacy affects people's ability to:

- Navigate the healthcare system, including filling out complex forms and locating providers and services
- Share personal information, such as health history, with providers
- Engage in self-care and chronic-disease management
- Understand risks

Compared to those with adequate HL, patients with limited HL have decreased ability to share in decision-making

about prostate cancer treatment, lower adherence to anticoagulation therapy, higher likelihood of poor glycemic control. Properly assessing the literacy level of individual patients or groups may avoid problems in clinical care and research. HL is fundamental to quality care, and relates to safety, patient-centered care, and equitable treatment. Self-management and HL have been identified as cross-cutting priorities for health-care quality and disease prevention. The purpose of this workshop is to discuss HL and its outcomes, share experiences and find common solutions to improve the health knowledge level in society.

Content

The definition and affecting factors will be explained by Dursun Çadircı.

Assessing methods and instruments will be introduced by Didem Kafadar.

Outcomes and reflections of HL to family medicine and quality of health will be discussed by Fatma Goksin Cihan.

Experiences, new approaches and research proposals will be discussed by all of the participants.

Keywords: Health literacy, quality, violence

WS-104

Electronic primary care guidelines: Experiences of translation and adaptation in different settings

Rabia Kahveci¹, Ilkka Kunnamo², Nicole Dekker³, Roman Schlager⁴, Duygu Ayhan Baser⁵

¹Department of Family Medicine, Ankara Numune Training and Research Hospital, Ankara, Turkey

²Department of General Practice, University of Helsinki, Helsinki, Finland

³Guideline Development Group Domus Medica vzw, Antwerpen Belgium

⁴Institute of General Practice and Family Medicine, University of Witten/Herdecke, Witten, Germany

⁵Department of children adolescence woman reproduction health, Kocaeli Public Health Directorate, Kocaeli, Turkey

BACKGROUND: There is increasing interest in Clinical practice guidelines (CPGs) development methods. CPGs are mostly developed by 3 methods in all over the world; named as; adoption, de novo and adaptation. The adaptation approach is getting more popular as it provides opportunity to less resource use with more context-specific recommendations.

Workshop PURPOSE: The aim of this workshop is to illustrate translation, adaptation and dissemination experiences of electronic primary care guidelines (EPCG) in different settings and to explore joint efforts for improving primary care guidelines (PCGs) as well as define how knowledge-sharing could serve this purpose.

Workshop Target Audience: Guideline developers, primary care physicians, institutions working in guideline development and/or dissemination

Workshop Description: Adaptation of guidelines is the systematic approach to considering the use and/or modification of (a) guideline(s) produced in one cultural and organizational setting for application in a different context. Most high quality evidence originates from developed countries, but may not be applicable to developing countries, and the development of guideline is expensive, time-consuming, and requires certain expertise. Consequently, adaptation can be used as an alternative to de novo guideline development and adoption. In this workshop EPCGs, their development and the dissemination process will be presented (IK). This will be followed by presentations from Belgium (ND) and Germany/Austria (RS) summarizing their experiences in using these guidelines, the translation process and the process of guideline adaptation. DA and RK will present description of ADAPTE, its worldwide use and the unique strategy Turkey has recently developed for adaptation of EPCGs, based on ADAPTE. The session will continue with an open discussion with speakers about how these activities could be taken further in order to increase use of PCGs and to have better, high quality adapted guidelines in each setting. The audience will be asked for their contribution with questions and comments.

Keywords: Guideline Adaptation, Guideline Development, Electronic primary care guidelines, ADAPTE

WS-105

Professional resilience of female family doctors during lifecycle transition events

Alice Shiner¹, Amanda Howe¹, Jessica Watson², Noemi Doohan³

¹Department of Population Health and Primary Care, Norwich Medical School, University of East Anglia, Norwich, UK

²School of Social and Community Medicine, University of Bristol, Bristol, UK

³Ukiah Valley Medical Centre and University of California, Davis, California, USA

""Justification""

This workshop relates to a project being undertaken on behalf of the WONCA Working Party on Women and Family Medicine (WWPWFM). It will form part of a global qualitative research project to determine the factors involved in maintaining the professional resilience of women primary care doctors during times of lifecycle transition, such as marriage, parenting, and caring for aging parents. These issues are related to keeping doctors in the workforce, and shed light on the needs of male doctors as well.

""Content""

The workshop will begin with presentation of key findings from a literature review on women family doctors' professional resilience during lifecycle transitions, followed by a summary of the data gathered during discussions between delegates at three previous workshops regarding this topic. Workshop participants will then be asked to discuss the issues raised, particularly considering their level of agreement with the conclusions reached during the previous workshops. The workshop will end with a plenary session to identify agreed common themes regarding challenges to resilience by lifecycle events, and the strategies and solutions that can help maintain resilience. The output of the workshop will be recorded in order that it can be used to identify themes for further exploration within the qualitative interviews and focus groups in the WWPWF research project.

Keywords: Resilience, Transition, Gender

WS-106

Curiosity & Complexity in Primary Care and Health Education. A Complexity SIG workshop

Joachim Sturmberg¹, Carmel Martin², Jim Price³, Bruno Kissling⁴

¹Newcastle University - Australia

²Trinity College - Ireland

³Brighton & Sussex Medical School - UK

⁴private practice

Presenters: Bruno Kissling, Carmel Martin, Jim Price, Joachim Sturmberg

Curiosity is something we observe with admiration in young children. It is the driver for exploration, learning and knowledge generation, an approach many of have been deprived off since medical school days with its root learning and protocol driven approaches. Here we want to explore the nature of curiosity and how it can enhance our thinking and acting. Systems and complexity science techniques offer an opportunity to use curiosity in a highly productive way for the benefit of our patients and our own satisfaction with work.

The workshop will take participants on a journey to explore:

- The notion of 'curiosity'? Participant activity – in threes – "How would you define curiosity"? "Why is it important for students and practitioners of medicine?" - facilitated by BK/JP
- The concepts of 'complexity' and complexity sciences - short presentation by JP
Brief overview of complexity thinking, models of complexity in health/healthcare/education (?JP)

Workshop outline

- On your own - Pick a problem currently facing you in your own clinical / educational / managerial role. Concentrate on what makes YOU curious about the issues? What/who are you 'curious' about? Why might this be?
- Group discussion - How can we apply complexity and curiosity to medical education a) at undergraduate level b) at postgraduate level?
- Group discussion - Can General Practice be reformulated to represent THE worldwide model for medical education and practice to ensure doctors remain interested in both the 'art and science' of diagnosis and care?
Q&A

Keywords: complexity, clinical care, medical education

WS-107

The Impact of Gender on Everyday Practice

Sara Rigon¹, Yusianmar Mariani², Nina Monteiro², Patrick Reichel³, Luís De Pinho Costa², Ana Nunes Barata⁴, Sara Belinchon⁵, Hassoune Hanim⁶

¹GP Specialist, Bologna Italy

²GP Trainee, Portugal

³GP Specialist, Vienna, Austria

⁴GP Specialist, Lisbon, Portugal

⁵GP Specialist, Madrid, Spain

⁶GP Specialist, Marseille, France

Justification:

Since ancient times Medicine in western countries has been dominated by white men while women were limited to more subordinated and caregiving positions, culturally more acceptable and socially convenient. Despite ongoing challenges, nowadays there are more female physicians than ever before in history and men nurses are not an awkward exception anymore.

Along with these changes come questions on whether gender influences the practice of medicine - in what ways? Does gender of the healthcare provider impact on patients? Do patients have different expectations from female and male physicians? If a patient prefers one over the other could this be considered gender discrimination? And where to go from there?

By raising the issue of gender we aim to start a discussion and inspire colleagues to abandon the anachronistic female-versus-male perspective and embrace a new attitude of understanding and collaboration for a gender blind Health Care profession. We hope to drive the primary health care community to break free of old paradigms and rethink its structure towards a future of equal opportunities and professional success regardless of gender.

Content:

The proposed activity will include:

- short presentation on gender roles and stereotypes in modern society and their translation into the working world and the health care profession
- working groups: participants will have the possibility to discuss in groups upon the impact of gender in everyday practice from different points of view: patients' perspectives and expectations, potential gender discrimination, career and leadership opportunities, collaboration among colleagues, and more.
- Report back and final discussion

Keywords: gender, health professionals, primary care, professionalism, gender medicine

WS-108

The hard art of clinical decision making in General Practice

Alessandro Menin, Giorgio Visentin
Csermeg, Italy

Justification: Following the Donald (Raj) R. Woolever article "The Art and Science of Clinical Decision Making" the Authors thought that every day physicians face difficult decisions when they advise the patient on the best treatment to follow and assist the patient in end-of-life care. There are many paths to a clinical decision, and what works well for one physician may not work well for another. The purpose of this workshop is to provide an opportunity to exchange views on this issue to discover the thought processes that help us to improve the patient care.

Content: The workshop will begin with a brief presentation of the topic with some practical examples accompanied by references from Evidence-based medicine, scientific literature, and material drawn from Medical Humanities as verses of poetry, short stories and aphorisms. Most of the time will be devoted to discussion in small groups that will have to confront on some guiding questions. Will cover topics of ethics and scientific method, intuition and experience, learning and shared decision making, technology and humanity. Some facilitators will help groups to channel their ideas to produce a report that will be discussed in plenary.

Keywords: Decision making, Medical Humanities, Experience, Intuition, Evidence-based medicine, Patient care

WS-109

Addressing sexual health consultations in primary care

Ruth Muñoz Maya¹, María Dolores Bernal Peinado², Elvira García Martín³

¹CS Don Paulino García Donas, Alcalá de Guadaíra. AGS Sevilla-Sur, Andalusia, Spain

²CS Nuestra Señora de la Oliva, Alcalá de Guadaíra. AGS Sevilla-Sur, Andalusia, Spain

³CS Utrera Sur, Utrera. AGS Sevilla-Sur, Andalusia, Spain

In 1975, WHO defined sexual health as "the integration of the somatic, emotional, intellectual and social aspects elements of the sexual being, in ways that are positively enriching and enhancing personality, communication and love". Sexual health is an essential part of global health concept, both at an individual and community level, as it has social and interpersonal involvements. It appears at every level in WHO definition of health: physical (physical limitations restricting sexual activity), psychological (self-concept, attitude and aptitude towards sexuality) and social (beliefs, myths, taboos, sexual variability).

Most of the work concerning sexual health is addressed to women, focusing primarily on birth control – becoming a gender bias-, and STD. This means setting aside sexual identity, sexual experience and other issues or variants of normality that could appear among our patients, including pharmacologic secondaries.

Being consistent with this definition of sexual health, family doctors have an important role in detecting and solving sexual problems. Therefore, training for sexuality is needed, since sexual alterations influence on and may be influenced by the different life cycles and family dynamics.

In addition, sexual attention is affected by the beliefs and prejudices of the doctors themselves and the society where health assistance takes place. In fact, many doctors in our area refuse to give advice on birth control because of religious beliefs; even more, if we talk about other issues of the sexual sphere.

There are also studies that show that the refusal of doctors to talk about sexual problems with their patients is greater than wished, since it has been seen that patients feel more confident and grateful when the physician begins this conversation.

Then, we find interesting evaluating the concept of sexual health that doctors have in our area and which issues are usually treated in case of performing any intervention.

Keywords: sexuality, sexual health, sexual dysfunction, interview, clinical skills

WS-110

Affirmations as a tool to help patients move towards behavioural changes

Anneli Rätsep, Ruth Kalda

Department of Family Medicine, University of Tartu, Estonia

Aim of the workshop.

After the workshop the participants

- 1) will be aware of affirmations as one of the micro skills in motivational interviewing (MI)
- 2) will be able to make affirmations for patients who seem unmotivated.

Often in primary care consultations patients need to make decisions related to their health. Increasing patient self-efficacy and providing patient centred care are the core skills of family physicians. MI is a counselling approach applicable in family physician's busy schedule. MI is used to help a patient make or get ready for positive changes in behaviour. Open questions, reflective listening, affirmations and summary are micro skills of MI consultation style while combined with MI spirit.

Affirmations are statements made by physician in response to what clients have said and are used to empower a patient by helping them recognize their strengths and see themselves more positively. Affirmative responses or supportive statements evoke patients to talk about behavioural changes and move in the direction of positive changes, no matter how big or small the changes will be. By offering positive affirmations, patients' confidence (or self-efficacy) can be built. To be effective, affirmations must always be genuine and congruent.

In the interactive workshop participants can practice selecting and making affirmations which may help patients to recognize their strengths.

Keywords: Motivational interviewing, affirmations, behavioural change

WS-111

Music therapy: A Hands-on Session for Biofeedback

Elena Benigni

Family Medicine Department of Accademia Shoho

Justification:

Music Therapy (MT) is the clinical and evidence-based use of music interventions to accomplish personalized goals with individuals, groups or families who seek to optimize their quality of life and improve their physical, social, emotional, and spiritual health and wellbeing. Nowadays we can monitor the effect of the music interventions by heart rate variability (HRV) analysis and in the meanwhile, generate a personalized music directly from the patient's HRV. MT is currently being utilized in various situations such as analgesia, sleeping disorders, anxiety, and infertility.

Content:

After a brief introduction on music therapy and its role in family medicine throughout the world, we will have participants recording their HRV with electrodes for the following sessions: baseline conditions, with irritating videos, HRV music biofeedback, and under meditation. The collected HRV data will be analyzed and we will discuss the possible future applications in family medicine.

Keywords: heart rate variability, music therapy, biofeedback

WS-112

Reverse innovation - re-engineering primary care

Sinan Mir, Joanna Thorne, Rakesh Modi

Royal College of General Practitioners, London, England

Focus on key emerging issues in primary care and explore how poorer resource settings have overcome these obstacles and the feasibility of implementing such interventions in the UK and Europe.

For example:

- Mental health: health "houses" in tanzania, china and iran that integrate mental health services seamlessly with primary care
- Chronic care models: Project connect in Zambia aimed at reducing patient no shows in clinic and a more streamlined efficient service pathway (Subsequently take up by Aids clinics in Alabama)
- Health workforce: community health worker model hugely successful in brazil, india, peru, haiti and wales(!)
- Health information: The rapid expansion of mobile health (or mhealth) in developing countries has created innovation hubs in Kenya, Uganda, South Africa, Rwanda where mhealth campaigns are transforming rural healthcare through improved data collection, disease surveillance, post-discharge surveillance, health promotion, diagnostic support and remote patient monitoring.
- Leadership and governance: polio eradication/compulsory leadership training for health managers in brazil

Focus on areas where European primary care can learn the most from developed countries including: remote healthcare, skills substitution, creative innovation, use of mobile technologies in healthcare, decentralisation of management, social entrepreneurship

Keywords: reverse innovation, global health, knowledge sharing

WS-113

SMARTER PLANET SMARTER HEALTHCARE, e-Health

Zelal Akbayin¹, Charilaos Lygidakis², Ulrik Bak Kirk³, Raquel Gomez Bravo⁴, Peter A. Sloane⁵

¹Hurriyet ASM, Istanbul, Turkey

²Bologna, Italy

³EQUIP, Copenhagen, Denmark

⁴SemFYC, Spain

⁵VdGM & ICGP, Dublin, Ireland

Introduction

E-Health is a relatively recent and broad term encompassing implementation of means of information and communications technology in the health and healthcare sectors for clinical, research, educational, service delivery, and administrative purposes. For the first time, technology is enabling the emergence of a new global mindset in interaction and collaboration among institutions, health professionals and providers, healthcare users and entrepreneurs. While e-Health has the potential to deliver high-quality and cost-effective solutions for diverse population needs in Primary Healthcare, address ever growing consumer demand, and improve health and healthcare in underserved areas and low- and middle-income countries, it still faces important challenges, such as interoperability and scalability.

Aim

Our workshop aims to provide a networking and experience-sharing platform, enabling participants to outline resources and present solutions they have used in their own circumstances and contexts. It will also provide a platform for participants to seek potential partners and opportunities.

Methods

The session will begin with a series of small presentations, outlining available resources that can be used for the

development of innovative applications, and showcasing the impact of examples of e-Health implementation on healthcare. To inspire participants, examples of challenges and areas in need of disruptive applications will be outlined. Participants will be invited to present an insight into their own solutions from a multi-perspective viewpoint. Finally, we will facilitate matchmaking of participants with the objective of encouraging them to form partnerships in developing cross-border technology services or participating in European projects.

Expected Outcomes

Participants will have the opportunity to reflect on the impact of e-Health on their own practice and the lives of their patients, and harness ideas on the feasibility of potential solutions and available resources. The session will also provide participants with a powerful networking opportunity that will facilitate knowledge sharing and the development of new partnerships.

WS-114

Approach to the patient with abnormal blood cell count in primary care

Leonor Troni¹, Vanessa Carvalho², Ieda Paula²

¹UCSP Torres Vedras, ACES Oeste, Portugal

²USF Cynthia, ACES Sintra, Portugal

Justification of and interest in the workshop

Complete blood cell count (CBC) is one of the most common laboratory tests in medicine. 10% to 20% of results are reported as abnormal. Therefore, it is in every clinician's interest to have some understanding of the specific test basics as well as a structured action plan when confronted with abnormal CBC results

This workshop will discuss abnormalities of the complete blood count (CBC), highlighting the work-up and management of patients at primary care level along with indications for referral.

It is an interactive session whereby participants will discuss the red flags in CBC through different case scenarios and they will learn new tips for identifying hidden diagnosis behind an abnormal CBC.

Learning goals

At the end of this workshop, participants will be able to:

- know the limitations of reference ranges for the CBC
- improve history taking and clinical examination
- address frequently encountered conditions associated with CBC abnormalities including anemia, thrombocytopenia, leukopenia, polycythemia, thrombocytosis, and leukocytosis.
- determine the role of medication
- know indications for referral.

Methods

The workshop is designed to be interactive with questions built into the program. There will be brief overview of the theme, case-based interactive discussion, role playing and video playing. In the end there will be a summary and 'action plan' to promote competency in hematological disorders

Expected impact on the participants

Help the nonhematologist recognize when a subspecialty consultation is reasonable and when it may be circumvented, thus allowing a cost-effective and intellectually rewarding practice

Keywords: Blood cell count, management, primary care

WS-115

What's in a name? General Practice or Family Medicine?

Carl Steylaerts¹, Berk Geroglu²

¹WONCA Europe

²Izmir Tepecik Training and Research Hospital, Family Medicine Clinic.

In this workshop, we use the technique of the Iceberg Model of Sohail Inayatullah to understand the resistance against changing names, even if they mean almost the same thing.

In his model, Inayatullah discovered 4 layers, hence the name Causal Layered Analysis:

1 The Litany – a complaint or a series of complaints, sometimes creating a politics of fear

2 Social Causes – that can explain the complaints; often detected by academics, who then formulate a remedy

3 Deeper level: discourse/worldview with a stakeholder level, the ideological, civilisational and epistemological level

4 Myths and beliefs, metaphors and collective archetypes

The remedy offered by academics is often failing for they didn't look at the deeper levels.

We will try to demonstrate this in this workshop, offering a classic black-and-white discussion and an alternative one, aimed at the future.

General Practitioner or Family Physician? This workshop is part of a series of workshops aimed at introducing Futuristic Thinking as evidence based as possible.

Keywords: Future; family medicine; general practice;

Who to inform? How to manage the cancer diagnose?

Özden GÖKDEMİR¹, Ülkü Bulut², Olgu Aygün³, Seval Yaprak¹, Hadiye Küçükkaragöz⁴, Dilek Güldal¹

¹Dokuz Eylül University, Medical Faculty, Family Medicine Department, İzmir, Turkey

²Balçova Public Health Center, İzmir

³Karabağlar Family Health Care Center, İzmir

⁴Dokuz Eylül University, Institute of Education Sciences, İzmir, Turkey

"Bad news" has been defined as any information which adversely and seriously affects an individual's view of his or her future; whether news is bad or not can only be in the eye of the beholder. "Cancer diagnosis" is one of them. To manage patient and caregiver is one of the responsibility of General Practitioner/Family Physician. The primary therapy of the patients whom diagnosed as cancer is a team work of GP/FP, psychiatrists, surgeons, medical oncologists and/or radiation oncologists. However, in the longer term, in clinical practice follow-up of outpatient who does not know diagnose could cause many difficulties. Therapy delays, communication problems, especially in advanced stages of the cancer are main obstacles. Structure of breaking bad news may change depending on the age, sex but mostly it is a cultural issue both of the patient and doctor. Breaking bad news well is an essential skill for all doctors, however the question is "who to inform?" "how to inform" and "to what extend to inform"

Methods

We will use an interactive approach for this workshop. Presenters will alternate clinical cases and more theoretical points as medical and the legal parts. Some caregivers don't want the patient to inform and some patients do not want to inform their families. To manage this issue by protecting time and legal points motivational interviewing techniques will be held during the workshop.

The incidence of patients who are diagnosed "cancer" are growing higher. GPs should not avoid from "breaking bad news", this seems to be a part of daily practice. The topics are

1. Physicians recognize themselves
2. Understand the Patient
3. How to approach different types of the patients
4. Ethical and legal issues

The results will be presented as a declaration.

Keywords: breaking bad news, cancer diagnose, follow-up of cancer patients

³Ankara university school of medicine department of family medicine

Infectious diseases contribute to high morbidity and mortality across the globe due to their nature of spreading through populations and due to varied susceptibility of individual patients. Mass vaccinations, public health measures, general awareness in keeping hygienic measures, modern diagnostics and treatments made a progress in infectious disease control and management. Many infectious diseases became officially eradicated or localised. However, in a globalised community any outbreak in any region of the world is actually an outbreak of the doorstep of any country or any practice. International travel needs less than 24 hours to ship pathogens around the globe. Large migrations due to war conflicts or economic reasons bring nearly forgotten infectious diseases which can be spread among new populations. Besides this, absence or low vaccination rates in these migrating groups present a public threat in the countries with longstanding control over infectious diseases. Preparedness to act in an outbreak of an infectious disease with a potential to spread quickly among the population served. Family physicians in many countries present the first line clinicians who might face a challenge of emerging outbreak of an infectious disease which can evolve in an epidemic or even a pandemic. Recent history tells us how quick a stable situation in infectious disease control can break down. This course will bring some key information on how to approach these challenges from human and biomedical perspective. The participants will have the opportunity to learn from experts in the field of anthropology, microbiology and family medicine and to discuss primary care role and responsibility in infectious diseases control and possible pandemic.

Family Medicine Residency Training in Primary Care Settings: Family Health Centers for Teaching

Tolga Günvar¹, İsmail Hamdi Kara², Serap Çiççili³, Okay Başak⁴

¹MD, Associate Professor of Family Medicine – Dokuz Eylül University Faculty of Medicine, Department of Family Medicine – Izmir

²MD, Professor of Family Medicine, Duzce University Faculty of Medicine, Department of Family Medicine – Düzce

³MD, Associate Professor of Family Medicine – Marmara University Faculty of Medicine, Department of Family Medicine – Istanbul

⁴MD, Professor of Family Medicine – Adnan Menderes University Faculty of Medicine, Department of Family Medicine – Aydın

Background

Family medicine residency training consists of three basic pillars: Rotations in hospital and other health care facilities, educational activities in family medicine departments and training in primary care settings. Between 1985 and 2011, formal residency training was consisted only of hospital rotations. With the rapid growth of family medicine departments in universities and clinics in research and training hospitals since 1995, educational activities of departments have increasingly been an important part of residency training. In 2011, with the acceptance of new core curriculum by TUK (Specialty Board in Medicine) obligatory rotations were decreased to 18 months. After a long term effort, necessary regulatory changes have been made to enable residency training in primary care.

Although valuable contributions have been made by Turkish Association of Family Physicians (TAHUD), Turkish Board of Family Medicine (TAHYK) and Academy of Family Medicine residency training in primary care settings is still needed to be discussed and clarified.

This workshop is aimed to discuss residency training in primary care settings with multi-dimensionally.

Methods/Program

- Presentation: Family Medicine Residency Training in Primary Care Settings (Okay BAŞAK)

- Group Works:

- o Group 1: Methods of Education and Assessment in Family Medicine Residency Training in Primary Care Settings

- o Group 2: Potential Problems in Family Medicine Residency Training in Primary Care Settings: How Do We Balance Education and Patient Care?

Family Medicine Practice Beginning And Population Assessment Guideline

Aysel Bařer¹, Giray Kolcu²

¹řemikler Family Medicine Centre no. 7 in Karřıyaka, İzmir

²Ulurmak Family Medicine Centre no. 12 in Karatay, Konya

In family medicine practice, there might be changes of duty for several reasons or Family Physicians can be assigned to newly opened Family Medicine Centres. Both the physician and the patients are affected negatively by such adaptation period in the family medicine branch where the relation between the physician and the patient is quite intensive. Moreover, not causing the patients to suffer during transition periods is also important in terms of the sustainability of healthcare services quality. A physician who has started to serve for a new population should become familiar with that population soon. Physicians should adapt to the population and become familiar with that population with an appropriate model in order to facilitate and accelerate such process.

We aimed to compile a guideline which will ease the orientation of the physicians started to family medicine practice to their population.

What about sharing your knowledge and experiences in this matter with us and contributing to our guideline?

How to start and manage insulin therapy in primary care - PCDE Workshop

Mehmet Sargin¹, Frances Xavier Cos²

¹Department of Family Medicine, Diabetes Division, Lütü Kirdar Kartal Training and Research Hospital, Istanbul, Turkey

²CAP Sant Marti de Provençals Unit of Ensayos Clinics – University of Barcelona -Institut Investigacio Universitari Atenció Primaria Jordi Gol, Barcelona, Spain

PURPOSE: It is well known that insulin therapy is a difficult point in the treatment of Type 2 diabetes. Patients as well as health professionals (nurses and GPs) might not feel comfortable with this therapeutical option, though often necessary when T2DM people live longer and hence are in need for more advanced and complex treatment plans. In the past decade, we were seized by an “algorithm storm” of hyperglycaemia treatment schemes. The European Association for the Study of Diabetes (EASD), the American Diabetes Association (ADA), the National Institute of Clinical Excellence (NICE) and a lot of other (inter)national medical associations have published their guidelines including insulin algorithms based on the best evidence available. Despite differences, all algorithms largely agree to recommend when and how to start with an Insulin regimen.

METHOD: This is a 2 hours workshop that through a case discussion would like to introduce the most common

difficulties when considering Insulin as a therapy option. The idea is to answer practice based questions regarding insulin therapy following a pedagogical model focused on clinical situations. How to recognize patients who need insulin (at diagnosis of type 2 diabetes, as a stepwise approach with worsening glucose control, and during an acute process). What kind of insulin molecules do we have available on the market? What are their differences and how to use them? What is the best and easiest way possible to start insulin therapy?

EXPECTED OUTCOMES: After this workshop the attendees will: know the indications for initiation of insulin therapy (who?); know how to initiate insulin therapy (how? Initial dose, titration, etc.); know how to follow up a patient on insulin (glycaemic target values, combination with other hypoglycaemic therapy options, side effects: hypoglycaemia, weight gain etc.); know red flags for referral (emergencies).

Keywords: insulin therapy, dose titration, initiation, follow-up

Course-004

A glance to the treatment options of osteoarthritis: old and traditional, new and challenging

Ülkü Sur Ünal¹, Sabah Tüzün², Serap Çifçili¹

¹Department of Family Medicine, Marmara University, Istanbul, Turkey

²Department of Family Medicine, Dr. Lütfi Kırdar Kartal Training and Research Hospital, Istanbul, Turkey

Justification

Vast part of the primary care patient population consists of patients with osteoarthritis. In a study conducted in Turkey; knee, hand and total osteoarthritis prevalence is reported as 5.351%, 1.11% and 8.42% respectively. As treatment options, there are painkillers used as symptom modifiers. But in recent years, new treatment options are tried to be developed for osteoarthritis and physical exercises are proved to be effective for patients to reduce the pain. In this workshop, the aim is to improve the physicians' knowledge about the new treatments for osteoarthritis and review the drug therapy and the physical exercises that can be suggested to the patients interactively.

Content

The session will start with a brief presentation about diagnostic criteria and traditional treatment options of osteoarthritis. Then each participant will be given an abstract about new treatment options of osteoarthritis and be asked to read them in 10 minutes. Afterwards these new treatment options will be discussed in terms of which of them can be applied and may be helpful as symptom or disease modifier. In the second part, the physical exercises offered for osteoarthritis will be reviewed in the light of current evidence, which can be suggested to the patients to perform. There will be mats for each participant who is willing to learn the exercises with the workshop moderators, serving the purpose of learning the exercises. The workshop will come to an end with a brief summary and asking the participants to give feedback.

Course-005

Panic attacks... the 10 minute solution

Enda Murphy, Patrick Paddy Halligan, Kandan Loganathan
Health Service Executive, Ireland

Cognitive Behaviour Therapy (CBT) is the best evidenced based approach recommended by the National Institute for Clinical Excellence (NICE) in the treatment of anxiety and panic attacks.

CBT is ideally suited to GP and Primary Care practice as it provides a proven method of psychological therapy that can be easily learned and applied within the constraints encountered in today's health care service.

Therefore, panic attacks can easily treated by GP's with a simple combination of low intensity CBT interventions and support.

This presentation aims is to introduce to GP's a low Intensity CBT skills programme, which was developed in Ireland and has been very successful in providing appropriate interventions for the treatment and management of panic attacks in primary care

Participants are invited to bring along case histories for discussion regarding diagnosis and treatment with the author both at and after the workshop.

Keywords: Panic Attacks, CBT, Cognitive Behaviour Therapy

Course-006

Insertion of the levonorgestrel intrauterine system in family practice

Zeynep Tuzcular Vural, Işık Gönenç

Haydarpaşa Numune Training And Research Hospital Family Medicine Department

Justification: The levonorgestrel intrauterine system (LNG-IUS) is a reliable and effective contraceptive method with many non-contraceptive benefits. The LNG-IUS offers the advantage of reduced menstrual bleeding (both in duration and amount) and lowers the risk of anaemia, ectopic pregnancy, and PID. The LNG-IUS has been successfully used in the treatment of menorrhagia, dysmenorrhoea, and endometriosis. Studies show that it is a safe method with few side effects. The LNG-IUS can be used up to 5 years before replacement. Insertion can take place at any time during the menstrual cycle providing the woman is not pregnant. It is the duty of the family physician to provide individuals with suitable contraceptive methods and apply them. However, many primary care physicians/family physicians are intimidated with the idea of applying the LNG-IUS because it requires skills which differ from applying a copper IUD.

Content: The objective of this workshop will be to learn/revise insertion techniques for the LNG-IUS and remember practical issues concerning insertion such as sterile insertion techniques, contraindications, necessary equipment for insertion and patient preparation. Before insertion, a bi-manual examination and sounding the uterus is necessary to determine the uterine position and the depth of the uterine cavity. Methods will include bi-manual examination and sounding the uterus on a pelvic model and insertion of the LNG-IUS. Participants will also discuss their experience with the LNG-IUS.

Keywords: levonorgestrel intrauterine system, contraceptive method, insertion, LNG-IUS

Course-007

Insertion of copper IUD's in family practice

Işık Gönenc, Zeynep Tuzcular Vural

Haydarpaşa Numune Training And Research Hospital Family Medicine Department

Justification: Copper intrauterine devices (Cu IUD) are small, "T-shaped" devices inserted into the uterus to prevent pregnancy. They are safe, effective, and long lasting contraceptive methods with few side effects. The copper T 380 A can be used up to 10 years before replacement. Insertion can take place at any time during the menstrual cycle providing the woman is not pregnant. It is the duty of the family physician to provide individuals with suitable contraceptive methods and apply them. However, many primary care physicians/family physicians are intimidated with the idea of applying the copper T 380 A because it requires equipment and insertion skills.

Content: The objective of this workshop will be to learn/revise insertion techniques for applying the copper T 380 A and remember practical issues concerning insertion such as sterile insertion techniques, contraindications, necessary equipment for insertion and patient preparation. Before insertion, a bi-manual examination and sounding the uterus is necessary to determine the uterine position and the depth of the uterine cavity. Methods will include bi-manual examination and sounding the uterus on a pelvic model and insertion of the copper T 380 A. Participants will also discuss their experience with IUD's.

Course-008

Myths, Misconceptions and Facts on Contraception

Vera Pires Da Silva¹, Sara Rigon², Ula Chetty³

¹GP Resident at USF Ramada, Lisboa, Portugal

²GP, Bologna, Italy

³GP, Glasgow, Scotland

Justification:

It has been proven that contraception can save lives and does improve health. However, contraception is also commonly associated with myths and misconceptions, leading to misunderstandings amongst women regarding its uses and benefits. It is important for doctors to be aware of patients' beliefs concerning contraception in order to better understand patients' fears and provide counseling for each woman to choose the most appropriate contraceptive method.

Contraception can be an issue for health professionals as well. One of the commonest concerns amongst GPs regards inserting contraceptives devices, as IUD's and implant and the required technical skills which may lead to a specialist or a more expert colleague referral. Therefore, it is equally important to address doctors' fears and misconceptions towards contraceptive technical skills.

This workshop aims to approach myths and misconceptions on contraception and oppose them with facts based on evidence for both patients and doctors.

Content:

During the workshop we will initially address some common myths and misconceptions on contraception; for example "contraception makes people fat", "contraception causes infertility", "contraception leads to ovarian cancer" and many others. Participants will subsequently have the opportunity to discuss and share their experiences based on knowledge and their professional practice.

Finally to disprove the common misconception that inserting contraceptive device requires specific technical ability we will demonstrate these simple procedures. Participants will have the opportunity to practice on three-dimensional medical simulator devices (which mimic female anatomy). Colleagues should leave the workshop with a better understanding of patients' concerns on contraception and new confidence on implant and IUD insertion.

¹1st Family Healthcare Center, Rize, Turkey

²Düzce University Faculty of Medicine Department of Family Medicine, Düzce, Turkey

³Dicle University Faculty of Medicine Department of Family Medicine, Diyarbakır, Turkey

⁴Uludere State Hospital Şırnak, Turkey

Primary care physicians are discovering the value of ultrasound visualization in quickly assessing, diagnosing, and determining treatment options for their patients at the point of care. There is a growing expectation among patients that the diagnosis and management of their symptoms and disease are primarily addressed in their physician's office. This expectation leads physicians to seek better diagnostic tools in their daily clinical routine. We aimed to present a training course for this purpose.

This course is planned as a one-day work including theoretical and practical training. Our proposed course schedule is as follows:

09:00-09:15 Fundamentals of diagnostic ultrasonography- Erdoğan Yavuz

09:15-10:00 Oral presentation: Introduction to Thyroid Ultrasound - İsmail Hamdi Kara

10:00-10:45 Oral presentation: Introduction to Abdominal Ultrasound- Mehmet Halis Tanrıverdi

10:45-11:30 Oral presentation: Introduction to Pelvic Ultrasound- Bahri Yıldız

13:00-14:00 Practical training: Thyroid Ultrasound - İsmail Hamdi Kara-Mehmet Halis Tanrıverdi-Bahri Yıldız

14:00-15:00 Practical training: Abdominal Ultrasound- İsmail Hamdi Kara-Mehmet Halis Tanrıverdi-Bahri Yıldız

15:00-16:00 Practical training: Pelvic Ultrasound- İsmail Hamdi Kara-Mehmet Halis Tanrıverdi-Bahri Yıldız

⁹Department of Family Medicine, Tepecik Research and Training Hospital, İzmir, Turkey

¹⁰Department of Family Medicine, Ankara Research and Training Hospital, Ankara, Turkey

Difficult to manage asthma is asthma that either the patient or the clinician finds difficult to manage. A patient with difficult to manage asthma has daily symptoms and regular exacerbations despite apparently best treatment. Most of the healthcare professionals don't know a lot about how to review that kind of patients and the possible causes for this situation. Moreover, there are some problems about referring these patients. This course aims to gain systematic and a practical approach to primary care and

other community healthcare professionals about difficult asthma management. Course is planned as a half-day work including theoretical and practical training. Proposed course schedule is as follows:

09:00 – 09:20 What is IPCRG ?
09:20 – 09:40 What is asthma ?
09:40 – 10:00 Asthma treatment
10:00 – 10:20 Childhood asthma
10:20 – 10:40 BREAK
10:40 – 11:00 Difficult to manage asthma
11:00 – 11:20 Asthma around the world
11:20 – 11:40 Asthma in Turkey
11:40 – 12:00 Case studies

Keywords: Asthma, management, primary care

Introduction to Homeopathy

Günnur Şerife Başar¹, Levent Hekimoğlu²

¹Homeopathy Association, Istanbul, Turkey

²Bursa İhsaniye Family Practice Center, Istanbul, Turkey

The topics

The short history of Homeopathy, its principles and efficacy

What is Homeopathy? Why is it named like this?

The basic principles of Homeopathy

Who developed homeopathy

The first clinical trials

What is health? What is cure?

The difference between chronic and acute diseases

Homeopathic remedies

Homeopathic Literature

The safety and efficacy of homeopathy

Homeopathy is a natural treatment using natural principles leading a total cure of organism by means of natural substances. Homeopathy is a holistic treatment acting not only on physical level but also on emotional and mental levels of organism. The main principles of homeopathy were developed by a German physician namely Dr. Samuel Hahnemann approximately 250 years ago. He claimed that the cure should be rapid, gentle, permanent and without any side effect.

Homeopathy treats every human being as a unique organism not as a sum of separate organs and tissues on contrary of conventional medicine. The homeopathic remedies are produced according to those principles and it acts each level of human organism in deeper levels as well as physical level.

They produce symptoms in healthy subjects and cure those symptoms when they are observed in a diseased state. That's why it is called "similar cures similar". But the aim is not to suppress the symptoms as it is done by conventional medicine, on contrary they strengthen the organism, the optimum balance and cure is reestablished in the body through the knowledge of disease and symptoms in the same way as Nature does.

Usually the homeopathic remedies are easy to use and harmless even when they are wrongly prescribed. That's why homeopathy is the best known and largest used alternative medicine all over the world. It is recognized by WHO as well as by health authorities of Turkey recently.

Course-013

Short Pediatric Musculoskeletal Examination Technique in Primary Care: PGALS (pediatric Gait, Arm, Leg, Spine)

Demet Merder Coşkun¹, Özge Keniş Coşkun², Evrim Karadağ Saygı²

¹Haydarpaşa Numune Education and Training Hospital, Family Medicine clinic, Istanbul, Turkey

²Marmara University Faculty of Medicine, Department of Physical Medicine and Rehabilitation, Istanbul, Turkey

AIM:

Clinical studies has showed that musculoskeletal system was the least examined body system in pediatric patients in both primary care and emergency setting. This studies also showed that health care workers were in lack of knowledge and confidence on pediatric musculoskeletal examination. Lack of konowledge and confidence on this issue has been emphasized that due to lack of resources about this issue in textbooks, undergraduate and postgraduate medical education. This workshop was designed to increase the knowledge and skills of primary health care workers on pediatric musculoskeletal examination.

Content:

In the beggining of the workshop all participants will be asked to complete the questionnaire which assesses their level of knowledge and competence about pediatric musculoskeletal examination. After a given brief presentation about importance of pediatric musculoskeletal examination in primary health setting, all participants will be asked to share their experiences in this regard. Afterwards another brief presentation about pediatric musculoskeletal development and follow up visits in primary care will be performed. Then the short pediatric musculoskeletal examination technique pGALS (pediatric Gait, Arm,Leg, spine will be shown practically. All participants will be asked to practice the technique. Applicability of the technique in daily practice will be asked to be evaluated by all participants. In the end of the workshop all participants will be asked to complete the questionnaire which assesses the impact of the workshop to their level of knowledge and competence about pediatric musculoskeletal examination.

Keywords: Pediatri, kas-iskelet sistemi, muayene becerisi, pGALS

BRITES

BR-001**Self-care in diabetes mellitus, a challenge in primary care**

Firdous Jahan

Oman medical college

Justification:

In the Arabian Gulf countries, we are facing a huge challenge with a increase in the prevalence of diabetes. In 2000, the age-adjusted prevalence of diabetes among Omanis aged 30–64 years reached 16.1% compared with 12.2% in 1991. Diabetes treatment and its complications will soon consume most of its national health care budget. To prevent serious morbidity and mortality, diabetes treatment requires dedication to demanding self-care behaviors in multiple domains, including food choices, physical activity, proper medications intake and blood glucose monitoring

Content:

Oman has one of the best primary care services in the world. I have been working more than 3 years now in Oman. One thing which is very distressing is that Omani patient do poorly with self-care in diabetes. We have started a group discussion with our patients and their relatives once a month.

This helped us somehow but how can we change the perception and motivate our patients to take care of themselves?

Keywords: diabetes mellitus, self care, primary care

BR-002**Primary Care of Adults with Intellectual and Developmental Disabilities**

Ian Casson

Department of Family Medicine, Queen's University, Kingston, Canada

Justification:

I find it challenging to accomplish high quality primary health care for adults with intellectual and developmental disabilities (also known as learning disabilities in the United Kingdom) in my family practice. Communicating effectively, obtaining consent, accomplishing adequate physical exams, even recognizing those with mild or borderline intellectual disabilities - these are among the issues that take extra time, assistance, and, probably, systematic approaches to solve. Guidelines¹ are available but seem hard to implement.

Content:

I would appreciate the opportunity to discuss these and other issues in the care of adults with intellectual and developmental disabilities with family physicians from other countries to better understand the issues and possible solutions.

Keywords: intellectual developmental disabilities, family practice, adults

BR-003**Chronic Patient Management in General Practice**

Anbreen Slama Chaudhry

Medical Education & Training Services, Fribourg, Switzerland

Patients suffering from chronic diseases often need to visit their general physician. The care of chronic patient is complex due to the presence of several concomitant illnesses, numerous treatments, and the need to coordinate care with other specialists.

How to be performant in the care of chronic patients, within a limited time frame, a set of issues to be discussed, keeping an essential time for physical examination, prescription time, and taking notes or filling the patient record time? How to maintain a quality patient-doctor relationship along with best practices? Management of the time in the consultation is a key issue, as well as managing its structure.

Planning the issues to be discussed and allowing patients to express their concerns might help. The specificity of chronic diseases is that major part of the care is provided by the patient himself. Therefore, Patient Education seems to be interesting in many ways: it allows patients to understand better the disease they are living with, to accept it and to make better health choices. It empowers them to lead their lives with (despite) their chronic conditions, and enhance their abilities of self-care. Patient Therapeutic Education needs to be provided in a collaborative way along with a nurse, other care takers, and must be integrated to the community the practice is serving, in order to better understand patient's needs. How to conciliate general physician's position of manager (working with efficiency) and educator (working with pedagogy)?

Keywords: Chronic Diseases, Patient Education, General Practice

BR-004**Clinical inertia in family medicine**

Valerija Bralic Lang

Private Family Physician Office affiliated to University of Zagreb, School of Medicine, Zagreb, Croatia

By definition, clinical inertia is failure of a health care provider to initiate or intensify therapy when indicated. Studies are mostly conducted in the USA and Canada, and in Europe in Spain and the Netherlands. They all showed widespread clinical inertia, with the percentage ranging from 30% to 68%. Clinical inertia has been assigned to both patient and physician characteristics. Some studies have linked clinical inertia to medication non-adherence, provider judgement, number of chronic conditions, severity of hypertension, and problems related to the implementation of guidelines. However, the number and complexity of factors associated with clinical reasoning within the decision making processes especially in primary care calls for a critical review of the concept. Are we inert each time when we fail to treat to target or when we prescribe without concordance with guidelines? How to make a decision in the context of uncertainty which is inherent in the practice of medicine? When is inaction appropriate? Is clinical inertia a patient- or physician-centered problem or a problem of health care systems? Do we need help?

Keywords: clinical inertia, family medicine

BR-005**Self-care in diabetes mellitus, a challenge in primary care**

Ruth Muñoz Maya

CS Don Paulino García Donas, Alcalá de Guadaíra. AGS Sevilla-Sur, Andalusia, Spain

Not long ago, an insulin dependent diabetic patient came to our consultation with bad controls of his glycemic levels. We had been barely raising insulin levels in the past five years. We then asked about diet, weight, infections, exercise, glycemic control chronology... As a result of the interview, we insisted on diet and modified insulin doses. After few consultations and quite increased doses of insulin, glycemic levels remained high. It seemed that our patient wasn't lying about his life regime - that was fine- but there was still something wrong. Our patient is in his sixties, with higher education, began insulin dependence fifteen years ago, he has no doubt about treatment and is a responsible person with good family support. He never fails his nursing consultations. What can be wrong then?

Asked again about treatment, we realized that he clearly understood how to inject insulin, but didn't rotate properly the injection places. As a result, little nodes of lipohypertrophy had appeared in his abdomen. We found them during physical examination.

After starting a proper rotation, he achieved better glycemic controls and we could diminish insulin doses again.

I think that within the self-care of diabetic patients, there is much more to teach than diet, exercise or foot care. They should know how to auto-explore other potential complications of treatment. Lipodystrophies appear even when rotations are done well in long term insulin dependent patients. It modifies insuline absorption and so does with glycemic levels, even causing serious hypoglycemia. Teaching our patients to detect lipodystrophies can improve glycemic controls and support their insuline treatment management.

Keywords: diabetes, insuline, lipodystrophy, glycemia

BR-006**Medically Unexplained Symptoms.... Treatment of Health phobias in GP Clinical Practice**

Enda Murphy

Health Service Executive, Ireland

Health phobia's and medically unexplained symptoms are one of the most frustrating consultations for GP's in practice today. This presentation will introduce a new approach developed in Ireland to change the recurring nature in these types of consultations providing a beginning, middle and end to the whole process.

Keywords: Medically Unexplained Symptoms, health phobia, CBT

BR-007**Cardiovascular Risk assessment in Hypertensive patients in primary care**

Aml Ahmed Salama

Faculty of Medicine, Family Medicine Departement, Menoufia Unversity,Egypt.

Different risk assessment tools are available to estimate the patient's 10-year risk of developing cardiovascular disease (CVD). It should be used to identify high-risk people for primary prevention. In hypertensive patient risk assessment is very important to identify the treatment options to prevent or minimize complication of the disease. Risky patients as patients with family history of ischemic heart diseases, diabetes, renal diseases and hyper-lipidmia are major contributors which should be assessed for every normal or hypertensive patient. In the primary care setting, prevention is the first aim, which could be primary prevention of the disease throughout modification of modifiable risk factors as hyper-lipidmia and smoking. Secondary prevention includes early detection for proper management and tertiary prevention which includes prevention of complications. The calculation of risk depends on the presence of risk factors as age, smoking, decreased HDL, micro-albuminurea and family history of ischemic heart diseases. End organ damage includes cardiac, Nephropathy, Peripheral arterial disease, Retinopathy and Stroke or transient ischaemic attack. According to risk assessment patients should be classified as high, middle and low risk for cardiovascular complications. Non pharmacological management of hypertension as well as medication have equal impotence in controlling hypertension and it's complication. How to educate your patient regarding his diseases, risk reduction and importance of management and follow up is the corner stone of primary care function and interest.

Keywords: Risk, Assessment, Cardiovascular, Diseases.

BR-008**Management in Primary Care**

Gerard Nguyen

Cabinet Marcel Monny Lobe, Soisy sous Montmorency, France

Rare Diseases are Rare and also Many. A specific disease by definition is rare and with 7000 Rare Diseases, the prevalence is 6 to 8% in the Community. Also Rare Diseases affect around 30 millions people in Europe. Few data exist to show the role and the effectiveness of Primary Care Practitioners. Some surveys have showed that Family Primary Care Practitioners (FPCP) played an important role in the care of Rare Diseases (RD).

FPCP see patients with Rare Diseases: 12.7 is the average number of patients with RD seen in Primary Practice. FPCP were the first to identify that « something is wrong » in 89% and established the diagnosis process in 54% of patients. They provided care in 56% of acute, 56% of continuous and 17 % of final care.

The new landscape of health care policy coming from the field of RD show some innovative issues. One of the most positive landmark is the multistakeholders cooperation in developing new tools, methodologies, procedures and frameworks in diagnosis, drug research and development, care, social services, networking and pricing and reimbursements of health technologies. FPCP Involvement is Rare.

FPCP manage common problems in real life and have a great experience of managing of many occurrence of extraordinary situations within the « patient and family centered » model. Their role in the care of patients with Rare Disease is fruitful for the physicians to access to innovative approaches, for the patients in their real life and for a community approach of care. FPCP are involved in the global patient care pathways. A call to action for an empowerment programme for an active role of FPCP will be proposed in the family ecosystem of care. Family Physicians remain the link between disease and patient centered concept of modern personalised medicine.

Keywords: rare diseases, diagnosis announcement, networking, reference centers

Dealing with difficult situations in primary care

Camille Defranceschi

Cabinet Marcel Monny Lobe, Soisy sous Montmorency, France

Mr. M. 80 years old, with a history of ischemic heart disease and arrhythmia (AF under oral anticoagulant), chronic renal failure and COPD, complained of an increase in his dyspnea with a NYHA stage III, as well as a recent "orthopnea", an lower limb oedema and a limiting walking. Clinically, the patient had crackles at both lung bases, and major bilateral lower limb oedema

BNP was increased to 800 and Creatinin levels confirmed the worsen renal function. Mr M refused to be addressed in hospital and wished to be managed at home by his family physician.

- Do we insist by explaining and convincing Mr M to be hospitalised (hopefully in cardiology bypassing the emergency unit)?
- Are there some professional risks by managing at home?
- What is the optimal management organisation to set up?
- for the acute phase?
- for the follow up and rehabilitation phases?
- How could we rethink our practices?
- What do we advocate for an ambulatory management of difficult situations in Primary Care?

Keywords: difficult and complex ambulation management

BR-010

Anticoagulant Therapy in Primary Care

Vishal Mallusingh Baghele

Department of family medicine, Sir Ganagram hospital, New Delhi, India

Anticoagulant Therapy in Primary Care

In developing country like India, Primary care starts at primary health center (PHC) and they are mostly situated in villeges. Nearly 70 percent people live in villgaes. Refferal centres are much away from villages. Transport systems are also not good. Almost all PHC's have ECG facilities. So myocardial infarction can be easily diagnosed at PHC only. But due to lack of transport facilities, one can not even think of cardiac interventions. So anticoagulats are best agent to save life of patients in this situation.

I used anticoagulant streptokinase in MI patients during my village PHC's posting. Results were excellent. Reversal of ST segments had been seen. But at many PHC's, family physicians do not use anticoagulant due to lack of confidence. To improve health facilities at primary care, special traning regarding anticoagulant use to family physician should be given.

Anticoagulants are gold standard to prevent life in patients of MI at primary center in countries like INDIA.

Keywords: priamry care, family physician, anticoagulant.

BR-011

Primary Care Skill Mix PriSM

Paul Irving Brown

Stowhealth

Our project has transformed our traditional GP and Nurse primarycare model to a comprehensive team of health professionals working together under the leadership and guidance of the GP. This has addressed the lack of available GPs to meet demand; whilst improving the patient experience and reducing the financial costs of running the practice. Following detailed analysis of GP consultation activity in March 2014 we identified minor illness, physiotherapy, dermatology, paediatric and mental health as areas that could be delivered by a specialist other than a GP. Having spent time designing pathways and governance framework arrangements we set about recruitment and implementation.

The skill mix project involves the use of a Physiotherapist, Paediatric Nurse, Mental Health clinician and a Dermatologist who between them are providing equivalent of 18 hours of GP face-to-face clinical contact per week at a cost of 700 Euros per week. This represents an annual cost of 25,500 Euros based on 46 weeks. To deliver this service with a GP would equate to 4 GP sessions per week giving a saving to the practice of over 30,000 Euros per year, whilst at the same matching activity levels, excellent patient outcomes and helping us meet our recruitment needs. The concept of skill mix to help match supply with demand is not new in primarycare. Neither is the term consultant. However their application have always been an extension to the traditional model of delivering primarycare.

Our PRISM approach has been to turn this on its head, firmly establishing the GP as primarycare consultant, directing the care plan and utilising the skills of a much wider team of professionals. This encourages GPs to offer patients more specialist consultations that actually saves costs and improves the quality of diagnosis and referrals. In this respect we believe our findings are original.

Using F1 technology to tackle obesity

Simon Victor Rudland

Stowhealth

Obesity is a problem that affects roughly a quarter of adults in the UK – and evidence suggests that these numbers are rising. Our experience with our Helping Health Change study with our partners at McLaren Applied Technology and Simply Health has allowed us to use Fomrula 1 technology applied to the human body using wearable devices. This has helped shape the way we empower many of our patients with weight-related conditions to make informed decisions based on accurate, factual evidence. The long-term aim is for this programme to inform the healthcare industry and demonstrate what can be achieved by bringing together diverse groups with different technical expertise to empower to people to lead an active and fulfilling life. I, as a General Practitioner would like to prescribe physical activity to my patients as the results are fantastic. How can we make this happen?

Keywords: Obesity, wearable technology, exercise, prescribed activity

BR-013

Hypertensive crisis in Primary Care

Lucio Giuseppe Granata

Specific Course in General Practice, Catania, Sicily, Italy

The finding of high blood pressure is a frequent cause of telephone medical advice or of urgent medical examination in GP's daily practice.

A large number of GPs usually manage this condition treating their patients with antihypertensive drugs, such as sublingual nifedipin, in order to obtain a quick hypotensive action.

Following the experts' opinion and literature, I am in disagreement with this procedure because it is isolated from the clinical context and because of adverse cerebral/myocardial/renal ischemia.

The correct diagnosis is the key to treat this condition appropriately.

Indeed, we should distinguish:

- 1) hypertensive emergency: hypertension with acute target organ damage (TOD);
- 2) hypertensive urgency: systolic blood pressure (SBP) >180 mmHg and/or diastolic pressure (DBP) >110, no TOD but symptoms presence (cefalea, anxiety, other);
- 3) severe asymptomatic hypertension: SBP>180 and/or DBP>110, no TOD, no symptoms.

The first circumstance must be treated immediately in the emergency department, while the other one can be managed in primary care in order to reduce inappropriate hospitalisation.

In the third case the purpose is to reduce BP in several days/weeks, as suggested by ESC guidelines, by:

- 1) starting a new therapy for "naive" patients,
- 2) verifying the compliance if already in therapy,
- 3) modifying dosage or adding new class drug,
- 4) a strict follow-up and screening for chronic TOD.

The goal in hypertensive urgency is to reduce BP in 24-48h (not in a few minutes) in order to reach the security level (<160 SBP, <90 DBP). Therapeutic strategies could be:

- 1) rest in a quiet room and give benzodiazepine if anxiety occurs,
- 2) oral ACEi (Ramipril 5-10 mg),
- 3) oral or i.m. Clonidine,
- 4) i.m. furosemide if volume overload is present,
- 5) follow the management of the severe hypertension

How would you deal with hypertensive crisis? Would you ask for specialist help?

Keywords: Hypertension, Hypertensive crisis, High blood pressure, Hypertensive urgency

BR-014**urgent cases in the primary care setting**

Patricia Mcwalter

king faisal specilaist hospital and reserach centre riyadh

I have experienced many challenges in dealing with urgent cases in our family medicine department. We are part of a large busy tertiary hospital, which accepts specialised cases from all over the country. In our primary care setting, we take care of more general cases as we see hospital employees and their eligible dependents, approximately 30,000 patients. When we need to transfer our patients to the emergency room for further management or admission, we are faced with some challenges. The ER is usually full because of limited capacity and also difficulty in finding beds for those needing admission. We therefore need to manage more urgent type situations than I would have been used to, when I worked back in the UK.

To address these challenges, the family medicine department has established a walk in clinic every day from 830am to 430pm and we try to manage as many patients as possible ourselves. There are 4-5 doctors and up to 10 nurses working there every day. We speak directly to the specialists about our more complicated cases and these patients can be seen in the walk in clinic by other teams, rather than going to ER. We also initiate therapy and organise investigations for patients prior to going to the Emergency Department, to ease the pressure on the ER staff. We have also established a fast track clinic in the evening run by the family physicians and less ill patients are transferred from ER to be seen here.

I have adapted to the challenges of urgent care management through good team work with my colleagues in our department and also close liaison with colleagues from other departments. A new ER department will soon open with greater capacity.

BR-015**Brite: Obesity Title: Tackling childhood obesity in Primary care**

Clare Wilson

Severn Deanery UK

One of the biggest challenges for me is to try to identify overweight children and address this in a sensitive way with them and their parents. There is the risk of alienation and causing offense versus the longer term health risks to the child and setting a pattern for life. I felt able to do this if a child was presenting with a weight or diet related issue but opportunistic discussion is difficult to initiate with few management options available to help. I took the opportunity to do a height and weight check on a child presenting with another issue, but how do you bring up the issue of obesity with a child and their parents and what resources do you have available to help support them?

Keywords: Brite Obesity childhood address solution

BR-016**Use of complementary medicine in geriatric population**

Firdous Jahan

Oman medical college

Justification:

This rise of the aging population has had an impact on the practice of medicine, as the unique needs of the elderly require the presence of a multidisciplinary and comprehensive medical approach. Complementary and alternative medicine (CAM) is growing very fast and the use of CAM in geriatric population as self-medication is rapidly evolving. CAM is a broad domain of healing resource to improve the quality of life and can be a valuable addition to the chronic pain management plan. CAM is mainly used as self-medication patients' own beliefs, and the wish for more control over one's own health.

Content:

Oman has one of the best primary care services in the world and having a special screening and follow up clinic for geriatric population. One problem we are facing that most of them they are using some kind of herb as traditional medicine. We have started taking history of CAM in our routine consultation and counseling them. This helped us somehow but how can we change the perception and motivate our patients not to take any medication without doctor's advice?

Keywords: Geriatric, complementary medicine, self medication

BR-017**Prevention in Elderly People: Challenges in Daily Family Practice**

Hakan Yaman

Department of Family Medicine, Akdeniz University, Antalya, Turkey

Family practice provides a family life-cycle approach and considers any special problem at any stage of the cycle. The post-parenthood and dissolution stages are challenging aging people and their families very much. Family physician play a crucial role while providing preventive and curative services and coordinative and advocacy tasks are also demanded during that period. This is an important challenge for the family physician, even (s)he is and "healing doctor" and has an "family-orientation" low resources, time demand, factors beyond the "office walls" are an impairment for concrete solutions. "Aging-friendly Primary Health Care" solutions need to be developed to overcome this challenges. Family physicians are in need of guidelines and tools and additional resources to help elderly people, who are in increasing demand of health and care services in community. Coordination between different stakeholders in community need to be established.

Keywords: Prevention, elderly care, family physician

BR-018

How can we establish positive communication with the caregivers in home care visits?

Hasan Hüseyin Şahin

Department of Family Medicine, Marmara University School of Medicine and Hospital, Istanbul, Turkey

In Family Medicine as we all know, one of our aims is providing a good care to homecare patients. Homecare has lots of difficulties for part of family medicine to make a qualified care. We make routine visits to most of our home care patients. We know that most of them are dependent to bed, have many limitations in daily life activities. In this case caregivers are our important partners during health care services. So family physicians need to communicate with caregivers instead of patients themselves. In Istanbul, Turkey; previous studies from our department shows that 96% of homecare patients have caregivers. 65% of them are living with their children; 19% with wife and at least one child; 12% with their spouses and only 3% alone. Of the caregivers 37% are their daughters; 35% are daughter in law; 16% are their spouses; 3% sons; 3% re formal caregivers. This situation takes us into another area of homecare. Beyond the patients, new difficulties that we face are to communicate with caregivers; to provide health education, and to make decisions together for the sake of the patient and maintaining proper condition. Other than physical examination of patients and treatment of illnesses, sometimes it becomes really difficult to understand the needs of the caregivers, making decisions together, speaking a common, clear but culture sensitive language. This becomes a time consuming procedure but on the other hand it is impossible to improve homecare despite the caregivers. Furthermore, we observed that time, confidence and good communication skills, which we can set up with self-education, regular and frequent visits and giving feedback and easy accessability of homecare unit, can be a solution to overcome these difficulties.

Keywords: home care, caregiver, family medicine, communication

BR-019

Elderly Care

Erdinç Yavuz

1st Family Healthcare Center, Rize

Primary care in Turkey has undergone a major change since 2010. Now, 21,750 Family Doctors serve the whole nation. The duties of Family Doctors are defined by legislations. According to these legislations they are required to have home-visits to their registered bedridden patients and file their medical records. These activities of family doctors are inspected every six months by authorities. We performed a cross-sectional study evaluating all bedridden patients over 65 years of age registered to eight family doctors working together in Rize 1st Family Health Care Center to evaluate demographic characteristics, main reason for their situation, their polypharmacy status, social support, mental status, incontinence status, number of home visits per month, action taken by family doctors each visit. A total of 29,479 people are registered to eight family doctors (min:3,071 max:3,938 for each family doctor) in our family health care center of whom 2,497 are ≥ 65 years of age (min:220 max:410 for each family doctor). A total of 93 bedridden patients were reported (min:3 max:24 for each family doctor). 46 visits to bedridden patients were filed (min:0 max:12 for each family doctor). Serebrovascular diseases (most frequently stroke), Alzheimer's disease and hip fractures were reported as the main diagnoses leading to being bedridden. Hypertension, type 2 diabetes and chronic obstructive pulmonary disease were common among bedridden patients. Polypharmacy is found to be an important problem. All of the patients were living with their relatives and the daughter or the daughter-in-law was the primary care giver. We will further discuss the role of family doctors in managing bedridden patients and lack of efficient coordination between professional caregivers. We think that management of bedridden patients constitute an important aspect of the elderly care and our discussion may give some insight of the mangement of these patients in Turkish primary care.

BR-020**Drug- Food Interactions In Elderly People**

Canan Tuz

Ankara University, Ankara, Turkey

Population ageing is a worldwide phenomenon. Dietary substances, including herbal products and citrus juices, can perpetrate interactions with conventional nourishments. The elderly are at risk for drug–nutrient interactions because they use a disproportionate amount of prescription and over-the-counter medications, often have poor nutritional status, and often are instructed to take their medication with meals to increase adherence.

Age-related physiologic changes result in a functional decline of organ systems and homeostatic mechanisms. Body composition changes with age, resulting in an increase in total body fat and a decrease in total body water and lean mass in the elderly. Changes in protein binding also affect the distribution of medications in the elderly. A decrease in albumin concentration, due to age itself or chronic disease can result with problems on dosing of medications.

The aim of this brite subtitle is to explain the effect of food on drug disposition in the elderly like enteral formulas, dietary supplements, substances in diet used habitually like caffeine, ethanol and grape fruit juice. Another purpose is to identify the effect of medication on nutritional status in elderly. The medication consists of anticoagulants, antepileptics, antidepressants, antimicrobials, endocrin agents, gastrointestinal agents, Parkinson agents that are most commonly used by elderly people.

Keywords: drug-food interactions, elderly care, comorbidity, family medicine

BR-021**Elderly Care**

Guzel Discigil

Adnan Menderes University Department of Family Medicine and Department of Elderly Health, Aydın, TURKEY

AGING AND WISDOM: Do wrinkles pave the way to wisdom?

Healthy aging is among the most recognized interests of primary care. Furthermore family physicians generally coordinate the geriatric team which includes many disciplines. On the other hand gerontology is the study of the social, psychological and biological aspects of aging. It studies physical, mental, and social changes in people as they age, investigates the interface of normal aging and age-related disease, the effects of an ageing population on society, and applies existing knowledge to policies and programs. Philosophy of gerontology, importance of social care for elderly health and wisdom as an aging merit will be the focus of this session.

Keywords: aging social elderly care

BR-022
Elderly Care

Fatma Goksin Cihan

Department of Family Medicine, NEU Meram Medical Faculty, Konya, Turkey

Primary health care (PHC) must be accessible and “friendly” to persons of all ages. PHC centers are currently organized around an acute, episodic model of which does not meet the needs of especially older patients with chronic diseases. PHC centers need to be adapted to the needs of older populations. PHC practitioners should also be well versed in the diagnosis and management of the well-known four common conditions of older people: falls, incontinence, immobility and confusion. Family physicians should be aware that medical problems often present differently in older people. And they should not dismiss symptoms by simply attributing them to old age. All PHC center staff should receive basic training in age, gender, and culturally sensitive practices that address knowledge, attitude and skills, in core competencies of elder care. The administrative procedures should be adapted to the special needs of older persons, including older persons with low educational levels or with cognitive impairments. PHC should adopt systems that support a continuum of care both within the community level and between the community and secondary and tertiary care levels. Information on the operation of the PHC center, such as opening hours and registration procedures should be provided in an age-appropriate way.

BR-023
Elderly Care

Didem Kafadar

Department of Family Medicine, Bagcilar Training and Research Hospital, Istanbul, Turkey

Holistic Care In Elderly Patients:

Holistic modeling is one of the core competencies in the definition of Family Practice. It is explained as an activity, which emphasizes “physical, psychological, social, cultural and existential dimensions” of health problems. Equal recognition of all these dimensions is expected and the detection of influences of these to health/illness behavior and disease pictures are recommended. Some unexplained symptoms and conditions might be solved by this way. The holistic approach has been developed as a movement against the reductionist biomedical approach in the late century and was very promising since then, although it still lacks evidence on benefit/harm, utilization, applicability and feasibility. In the routine daily practice of family medicine with so many patients with different demands and in a limited time how can we approach our elderly patients who have many problems holistically? Elderly patients have health problems usually bounded to each other for example they may have chronic illnesses along with cognitive impairment and mobility disorders as well as social isolation. Even if one of the health problems is solved health status may not improve due to other unrecognized problems. A clear definition of holistic care in elderly people and a discussion on this concept in family practice may be useful. Utilizing different assessment methods and instruments to assess the health status of the elderly multidimensionally is one of the suggestions.

Elderly Care

Mehmet Ungan

Department of Family Medicine, Ankara University, Faculty of Medicine, Ankara, Turkey
Studies on Care of Elderly in Family Practice: Are We in Need of A Research Agenda?

The share and demand of aging population is increasing in different European countries. Family practice is as the first point of care or gatekeeper intensely involved with the care of this special risk group. Issues like multi-morbidity, complexity, poly-pharmacy, frailty, disability, caregiver problems, family issues, low resources are frequently on the daily agenda of a family physician. Practicing guideline-based and evidence-based care is another challenge in family practice, because most trials are lacking data and therefore do not include recommendation for this age group.

Family practice needs to create its own evidence and therefore researchers in Family practice might in need of a guide, which provides a framework their studies. This Agenda might also help to prioritize certain research projects, which might be supported and/or funded.

BR-025
Meditation Intervention for Chronic Disease Populations in Family Medicine

Elena Benigni

Department of Family Medicine, Accademia Shoho, Rome (Italy)

When I started to practice meditation, my goal was to dedicate a little more time to myself, but after a few months I was aware that I was discovering something very powerful, maybe one of the most effective procedure to feel better, physically, emotionally and socially. Furthermore, as I was improving my quality of life (my gastritis disappeared, I gave up smoking and noticed that I was having more free time). In this meantime I was wondering if I could expand this new knowledge in order to help my patients more and I was reviewing medical literature about. Surprising lots of studies demonstrate efficacy (especially for chronic disease) reducing symptoms. Then I started this new procedure with some "special" patients, principally those who are always complaining about something. Surprisingly, I discovered that meditation is pretty much well accepted by patients and for most of them, practicing 15 minutes per day, decreases their anxiety level, depression and chronic disease symptoms. GP doctors always face situation where the disease causes are multi-factors and we are often obliged to manage social, emotional and cultural situations, but do we ever try to speak with our patients about invisible things like their feelings?

we will demonstrate a practical group session, where participants could experience meditation their self. We want to stimulate discussions on the practicality and applicability of meditation among our patients population. In the end, we hope there will be proposals for researching and collaboration within family physicians from different countries to promote exercises in the daily clinical practice.

Keywords: Meditation, Chronic Diseases, Wellness, Complementary and Alternative Medicine, primary prevention

Promoting Health

Patient: Doctor, I don't feel well and I'm not sure why.

Doctor: I want you to meditate for 20 minutes, twice a day, exercise for at least 30 minutes a day, avoid processed foods, eat plenty of organic fruit and veg, spend more time in nature and less indoors, stop worrying about things you can't control and ditch your T.V. Come back in 3 weeks.

BR-026

How can we minimize the numbers of patients coming with fever to our clinic

Hayriye Kulbay Yuksel

HAYRIYE KULBAY

One of the most annoying and unnecessary task of my daily scheme in my clinic is dealing with the patients with fever. These patients are especially children. Parents are usually nervous and come in panic to the clinic. The fever is an emergency reason for them to come. They want to see me without an appointment and are impatient for waiting their turn. They want examination priority. When I ask how high their temperature is, some of them don't know what fever threshold is and consider normal levels as fever. When they bring the child with fever, they also bring other child/children to be examined for fever or signs. When I check them, usually they have no fever and no certain symptoms yet. It is a time consuming task in my clinic for a busy day. These fever related presentations hamper all other appointments. It causes me stress to manage time for others waiting for me. My solution for such situations are educating all adults who come with fever for themselves or their child/children for any reason. I especially focus on new mothers just after giving birth. I start conversation and give information about what to know about fever. How to measure temperature? How much temperature is fever? What to do when there is fever? How to control it? When to go to the doctor? What can be the accompanying symptoms for emergency? IF some of them come in the same way, I start to give information to them from the beginning again. Education initially takes time for me as well as taking care of all other reasons. Fortunately, as a result of my efforts, I get my reward. My patients have now stopped to come in panic for fever. My daily workload is markedly lowered compared with other colleagues.

Keywords: Fever, Emergency, Preventive Approach

BR-027**Social media as a tool for health promotion in adolescence**

Andrea Pighi

School of General Practice, region of Veneto, Vicenza, Italy

Health promotion is one of the main tasks of primary care and taking care of adolescents' health is one of the challenges of general practitioners; sometimes questioning their role and using new communication tools in order to intervene effectively on this population.

Adolescents usually are poorly geolocated and hardly contactable by health institutions. In fact, nowadays adolescents tend to engage with the community mostly virtually.

Social media and Web 2.0 are viable points of contact between the adolescents and health institutions; the potential of these tools are a resource that the general practitioner must learn to know and exploit.

This work will present the importance of using of social media as a tool for the prevention of mental distress and suicide among adolescents according to current scientific evidence.

In this age group, behaviors resulting from different degrees of psychological problems and not organic diseases are the major risk factors in terms of mortality and morbidity.

A website (www.thinkpositiveproject.it) and a page on Facebook (Think Positive Project) has been implemented in order to provide information and useful contacts to these subjects, to promote the fight against stigma and consequently bullying, cyberbullying, homophobia, racism and all kind of discriminations.

The Project aims at spreading common preventive messages with multimedia content of various kinds in a virtual community, so to encourage users to healthy and inclusive activities, and, trying to be light and ironic whenever possible, to promote "positive thinking". That is proven to be helpful in providing supports to people in critical times of their lives.

Keywords: Adolescents' behavior, Health promotion, Web 2.0

BR-028**Using Repellent as Mosquito Bite Protection: Solving Problem with the Problem**

Hardisman Dasman

Faculty of Medicine, Andalas University, West Sumatera, Indonesia

Mosquito has significant role as a vector various infectious diseases, such as malaria, dengue, chikungunya and yellow fever, especially in tropical regions. Female mosquito needs mammalian or human blood for maturing of its egg and while sucking human blood, mosquitoes also transmit parasites that will cause diseases in human. In order to protect from mosquito's bite, people has been used various strategies which include using burning, toxic spray, and electric repellents. Unfortunately, using the repellents cause new health problems such as respiratory disorders, cough and eye irritation. Moreover, the repellents also contain allethrin, the toxic substance that causes oxidative stress and cell damaged that leads to carcinogenic process. Allethrin will be released to the air from their smoke or spray. Even, our experimental study shows that that the electric repellent also had significant effect of oxidative stress due to it allethrin content. What is the best strategy as mosquito bite protection? Do we need to campaign to stop using mosquito repellents?

Keywords: Mosquito repellent, allethrin, oxidative stress

BR-029**Cancer screening in primary care**

Duygu Altıparmak

Department of Family Medicine, Marmara University Medical Faculty, Istanbul, Turkey

I think, raising awareness of my patients about increasing frequency of cancer is my responsibility as a family physician. If I can identify possible malignancy at an early stage during periodical health examinations then it will be possible for me to accomplish one of my main my mission in preventive medicine. In order to do that, family physicians should be able to do the cancer screening based on individual characteristics of each patient, in the same manner as they perform antenatal care and immunization. Incentives for cancer screening might a good tool to increase performance of family physicians in this field. Is there any positive/negative experiences with incentives for cancer screening ? What other measures can be taken to increase the cancer screening rates for whole population?

Keywords: primary care, cancer screening, preventive medicine

BR-030**Obesity**

Suzan Yazici

Department of Gerontology, Akdeniz University, Antalya, Turkey

Obesity is one of the major health problems. Even though several methods exist to handle obesity, we all know that obese patients who benefit from those methods are few. Especially the elderly obese patients have many unsuccessful experiences in losing weight which make them hopeless for future attempts. Interviews were conducted with elderly obese patients to see their attitudes towards losing weight and we have developed a long lasting, individual, program aiming steadily weight loss with low expectations. The implementation of the program is time consuming and needs sustainability. We have lost contact with some patients due to time restrictions. How can we achieve sustainability? Who should be leading such a program? Can the relatives be a part of the program? These are some questions we try to answer and want to discuss.

Keywords: Obesity, elderly, weight loss

BR-031**Integrating Smoking Cessation Practice into Daily Primary Care Routine**

Tevfik Tanju Yilmazer

Family Medicine Clinic, Tepecik Training and Research Hospital, Izmir, Turkey

Smoking is the leading preventable cause of premature death. Since smoking is a chronic addiction, family physicians are at a unique position to smoking cessation counselling. Encouraging smoking cessation is the most effective intervention family physicians can make to improve their patients' quality of life and increase their lifespan.

Yet I have always had a problem to fulfill the necessary steps in smoking cessation counseling during primary care practice with various reasons such as lack of time and/or lack of motivation of the patient.

I do have the common sense and experience to comprehend that combination of brief, empathetic and appropriate interventions and pharmacological therapies can help encourage smokers to quit smoking.

So I would like to learn if you had any intervention technique that just serves the purpose of smoking cessation during the busy daily schedule of the primary care health system.

Keywords: primary care, smoking cessation counseling

BR-032**Management of obesity in primary care: a mobile health service example**

Aykut Ardic

Department of Family Medicine, Sevket Yilmaz Training and Research Hospital, Bursa, Turkey

There are 16 family physicians who have started to part time educational program in Bursa in Turkey. We are supposed to be family practice specialists in six years. Turkish Ministry of Health supports the fight against obesity. The officials have sent pedometers to us and we have delivered them to the obese patients. The aim is encouragement of obese patients. There are several motivational reasons among obese patients to fight against obesity. Health is usually the second motivational reason. We have also detected accompanying depression with obesity in our patients. We will bring our experiences on obesity. Our results will probably be interesting for you. We would like to share the succes rates of the program.

Keywords: pedometer, obesity, motivation, HbA1c, depression

BR-033**Learning from Clinical Experiences**

Fikret Sipahioğlu¹

¹Istanbul University, Cerrahpasa Medical Faculty, Department of Family Medicine, Istanbul, Turkey

²Istanbul University, Cerrahpasa Medical Faculty, Department of Internal Medicine, Istanbul, Turkey

Breast cancer over age 75 is a challenge for clinicians. Most radiologists recommend to stop screening with mammography by that age, although for women with multiple risk factors including early menarche, late menopause, late pregnancy, hormone replacement therapy, lack of breast-feeding, family history, concomittant pathology of the endometrium, alcohol use and work at night time. the risk still remains. In undiagnosed cases, the clinical picture is mostly related with symptoms of metastatic bones, spontaneous fractures or severe back and ischiatic pain that persists. Fatigue, loss of appetite, depression and mild-moderate anemia may accompany the symptoms.

We suggest to keep on screening with clinical examination every three months and yearly breast MR for women over 75 with multiple risk factors for breast cancer and be alert on clinical signs.

Keywords: breast cancer, screening, elderly

BR-034**BRITE discussion group related to how practices around the globe address violence and poverty as part of patient presenting medical problems**

Patrick S Mcfarlane

Eastern Maine Medical Center Family Medicine Center and Residency/Clerkship Program

As.4 to.7 percent of all medical visits have underlying psychosocial foundations, and that much of that foundation is built on the experience of adverse childhood events and adult experience of interpersonal violence. This BRITE session will provide a forum to discuss what physicians in primary care think and do to address the issues of violence (micro and macro) in their practices and how they think about outcome with scholarly research and/ or practice improvement projects.

Keywords: Violence Primary care Screening Intervention Practice Improvement

BR-035**Genre violence in teenagers**

Diana Dominguez Jimenez

GP Trainee at the Health Centre of Estepa, Sevilla

About 90% of women older than 30 years in my area are treated with antidepressants and anxiolytics. Some women described herself "nervous", most of them if you dig you found marriage problems. But slowly the age of the women has been decreasing, and when I started talking about the origin of the anxiety, very often there were for issues with the partner, but if I kept digging I found problems of genre violence, not physical, but psychological and they were teenagers!.

I know is the best moment to empower them, to make them realize the situation so it don't go further, but I found more difficult to approach the topic with a teenager, you have to be very more careful and sensitive cause if you make a mistake most won't come back.

I started researching and it was amazing how the genre violence had increased in Spain in the last years. In other countries is happening the same? why is this change in society? How can we help teenagers to realize that some behaviors are not love (jealousy, prohibitions, controlling calls...) but an "aggression"?

Keywords: genre violence, teenagers, empowerment

BR-036**Violence in Health**

Nazan Karaoglu

Medical Education and Informatics Department, Meram Medical School, Necmettin Erbakan University, Konya, Turkey

Society and physicians seem to have a conflict about their understanding in respect to "meaning of being a doctor" resulting in violence against physicians. If medical education is aiming to serve society, then we should understand differences in perceptions of the role of doctors in society by studies in between the medical education community and society.

According to the interviews we made for a recent project it is obvious that although physicians know and believe the fundamentals of ethics they don't practice ethically or they could not show that they are practicing ethically to their patients and to the society? Society prefers good communication, empathy and honesty than medical knowledge. Patients don't want their doctors to be rude, unsmiling and unwilling to talk. They want to get answers to their questions without anger.

Of course violence cannot be accused and cannot be forgiven but we should understand why we are here now and then we can solve violence problem. "Who is a doctor? Who is a good doctor and who should be? Should be defined clearly by physicians and shared by society to rebuild trust and prestige.

Keywords: violence, professionalism, ethics, empathy

BR-037**The Reporting Obligations of Physicians**

Murat Altuntas

Sermet Family Medicine Center, Public Health Agency of Turkey, Isparta, Turkey

Home Healthcare is an innovative and fast-growing public service in my country. Have you ever encountered any kind of bruises in any part of the body of the patient at your Home Healthcare Practice. In case you encountered such a situation what would your reaction be?

Would you pretend not to see it or would you report with conscientious responsibility to judicial authorities for proper measures to be taken. As a health care worker, are you aware that you are expected to report such cases as they have to be taken into consideration by the crime authorities.

Keywords: Home Healthcare Practice, Violence, Denunciation, Judicial Authorities

BR-038**The Socioeconomic Divide and How it Effects EU Healthcare**

Veronika Rasic

Dom zdravlja Koprivničko-križevačke županije, Croatia

There are profound socioeconomic differences between counties in Europe. This divide comes in the form of political ideology, poor health policy, unavailable medical equipment and medication, low salaries, long work hours, large number of patients per doctor etc. These counties, like my own, are often under represented in EU decision making bodies and professional gatherings. The effect of these factors deeply impacts the everyday work of doctors and the health outcomes of their patients. They are also contributing to the current massive emigration of doctors from Croatia (about 1000 in the last year - roughly 5%) and other countries. The longer these issues are ignored and not given serious consideration it is very likely that healthcare in many countries will continue to deteriorate.

In Croatia an average GP sees between 50 and 100 patients, the bureaucracy is growing and badly managed, we have had multiple pay cuts, hospital strikes, we have yet to reach an agreement between the health ministry and doctors' syndicate, and the list goes on.

We need to start talking about these issues so that we can start finding solutions. But it is also important for counties on the other side of this socioeconomic divide to hear about what we are facing. Maybe together we can start to work on a brighter future for healthcare in all of Europe.

Keywords: health crisis, socioeconomic divide, EU health policy, general practice

BR-039**The Socioeconomic Divide and How it Effects EU Healthcare**

Elle Mall Keevallik

Department of Family Medicine, Tartu Ülikool, Estonia

There are profound socioeconomic differences between countries in Europe.

After the Soviet Union collapsed and Estonia became independent there was a big change in our health care system which totally reformed our primary care. GP`s were forced to work independently and most of them chose to work alone. Today we are moving towards group surgeries, but still we have 70% of GP`s working alone, which then offcourses leads to burnout. Doctors who are working alone don`t have the advantages their colleagues in group surgeries have. for example holidays, courses, trainings. They have to do more for the same money.

Today all European countries are struggling with ageing - patients are living longer, doctors as well. In Estonia we have in total 802 GP`s and 60 of those 802 are younger than 40 years old. This will lead to a catastrophe in next 10-20 years. Massive migration is the many reason this is happening. Reasons why doctors are going to other EU countries are the salary, better working hours, less patients per doctor and better founding from the Government.

We need to start talking about these issues so that we can start finding solutions.

Keywords: health crisis, socioeconomic divide, EU health policy, general practice

BR-040**Managing Chronic Communicable Diseases in Primary Care**

Abdul Hafiz Mohamad Gani

Department of Health, Federal Territory of Labuan, Labuan, Malaysia

Chronic communicable or infectious diseases like HIV, Hepatitis B and Tuberculosis are common cases seen in primary care clinic. In developing country like Malaysia where limited number of infectious disease specialists available and in some remote area, primary care physician plays an important role in managing these group of patients. In view of this current situation, I have decided to create an infectious disease unit in my own community clinic. This clinic consist of a dedicated team managing different aspects of infectious diseases from patient's education to secondary prevention (e.g. HIV counseling, contact TB screening, DOTS for TB and ART for HIV). The team runs by medical officers, paramedics and nurses. All of them have received proper training from the tertiary center. Any complicated cases will be referred to me for further evaluation and in some situation infectious disease specialist will be contacted for their expert opinion and management. I would like to share my personal experience and would like to know if there are other primary care physician whom management is different from what I have been practicing.

Keywords: Chronic Infectious Diseases, Managing, Primary Care

BR-041**The Socioeconomic Divide and How it Effects EU Healthcare**

Alexandra Georgios Tsipou

VdGM

Alexandra Tsipou -GREECE

General Practitioner in PHC-Athens

It is the holistic approach of a patient that persuaded me to become a GP. In Greece, nowadays, a few times we can allow ourselves this luxury: of time-less than 10 minutes for an overall examination in the ER. We are constantly constrained by economical targets and numbers when it comes to decide on how to manage a medical condition. If we have "overpassed " those figures, we are not permitted to prescribe medication, lab tests. In a night shift, people are queuing for hours, because triage cannot be done due to lack of doctors. It is the austerity measures that provoked all this irrational loss of jobs which led to the massive immigration of young specialists physicians.

Very often we have at our disposal only a few minutes to share with a patient who is receiving a life changing diagnosis. Social services are totally chopped off from the NHS. It is estimated that above 3 million of people are without medical insurance, and yet this number might be underestimated. Due to the disproportionate reduction in resources in General Practice that has taken place for the past 5 years, people cannot be managed locally, close to their homes- the PHC are either distant or cannot offer holistic centred care. And the list can go on.. According to the WHO the state of unhappiness is a severe unhealthy state to be. Here, both doctors and patients feel the same. If our vision is to focus on prevention, health education, treatment of disease, support our patients for their well-being, then our healthy policy makers should strive hard to engage such measures. Otherwise, we are facing an obvious failure to eradicate this humanitarian crisis.

Key words: Medical insurance- Austerity measures- doctor's immigration-Social services-unhappiness-humanitarian crisis

Keywords: doctor's immigration, humanitarian crisis, unhappiness, austerity

BR-042**How do we convert intuitive diagnoses into guidelines for mental health practice in the fledgling primary care centers in China?**

Kendall Anne Searle

Monash University, Melbourne, Australia

In China, where the primary care system currently in development, one-on-one, time with the patient remains limited and is often not private. In many western countries, the diagnosis of mental health conditions generally involves the use of a culturally validated and globally accepted questionnaire. These questionnaires, in their shortest form take 2 mins to complete but often take much longer and thus may not be considered in a standard consultation. Indeed, to establish the appropriate patient-physician rapport to determine the sensitive matters of mental health a longer consultation time is preferable.

In a time poor-setting, what approaches do other primary care physicians from other countries take to ensure that mental health is kept on the physician agenda (especially common mental disorders where somatic symptoms may be important indicators)? Is it possible that physicians intuitively make a preliminary assessment by patient profile (i.e. subconsciously bring together known behavioural and demographic risk factors for poor mental health to facilitate diagnoses)? If so, how can these invaluable insights be translated into a guideline for fledgling primary care doctors in China?

Keywords: Mental Health, China, Diagnosis,

BR-043

Primary Care Under Attack

Emrah Kirimli

Umraniye Merkez ASM, İstanbul, Turkey

During World Health Report, primary Health Care (Now More Than Ever) published at 2008 Turkey was in the middle of health in transition project of World bank. Family medicine program was one of the biggest part of transition project and primary care was supported. But after 2011 policies changed, direction of health care turned to hospitals. That is what we call primary care under attack.

Primary care system was under attack of privatization policies, medicalization and pharmatization. Particularly in Turkey, this comes with less investment to primary care, employee shortage, more hospital visits, increasing mortality&morbidity. So our unions, primary care associations and medical chamber is trying to change this situation. We did workshops, meetings, symposiums. We did strikes, joint actions, campaigns, commercial ads and etc. And we have a good experience against this sort of privatization issues and its effect on primary care.

We can see that this is not a specific problem for turkey. It is called health in transition and effects all countries and all primary care. NHS has the same problems (<http://www.keepournhspublic.com/index.php>). This is also a big issue for former eastern block countries or welfare countries like Sweden.

In this BRITE session we would like to learn from our colleagues and share our experience against government's privatization policies and attack on primary care. We want to create new collaborations for expand primary care influence on health care as it stated on WHO report Primay Care More Than Ever.

Keywords: Primary Care, health policy, NGOs

Electronic Health Records

Erdinç Yavuz

1st Family Healthcare Center Rize, Turkey

Type 2 Diabetes Mellitus with its progressive nature and debilitating complications is one of the most difficult chronic diseases to manage. Different chronic care models were suggested for better diabetes care. Their common characteristic of these systems is that they all require advanced electronic information systems. We developed a follow-up chart with 16 main items to adress this necessity for an adequate and practical tool to help and guide the clinician to follow-up and monitor their diabetes patients. The chart also has "Diabetic foot evaluation form" and ready consultation forms as appendixes. This chart is planned to be integrated in Family Medicine Information Systems (AHBS) used currently by 21,750 family doctors in Turkey. The chart was prepared by using American Diabetes Association and Turkish Endocrinology and Metabolism Association (TEMMD) guidelines, two widely accepted and acknowledged guidelines in Turkey. A printed version is readily available. An electronic verison to be incorporated into information systems is yet to be developed. We postulate that such a powerful tool encompassing comprehensive properties of diabetes care may have a paramount role in management of diabetes in primary care and help better control of the disease.

BR-045**Simplifying the Lives of Elderly**

Nur Sehnaz Hatipoglu

Konak 24 nolu ASM, Izmir, Turkey

Developments in medicine, reaching to effective medical departments by everybody easily, decline in birth rate, developments in treatment of chronic diseases, civilization and developments in technology enabled longer life time.

The elderly population increased as a result of long lifetime. The most increased group in elderly population is age of 85 and over. The rate of elderly over age of 65 to population in our country is 7.5% and expected to be over 8% in recent years.

Getting aged is a part of nature but it is important to continue this period in good quality. As years pass, the organs of the body also ages and loses some functions.

As a need of modern era, the developments in technology are mostly for young people but these developments don't address to elderly who have many changes both physically and mentally. The most important changes are decrease in hearing, visioning and motor functions.

Elderly can't go outside frequently like others and spend most of their time at home watching TV, reading and chatting with neighbours on phone. For these reasons the tools they use must be as basic and also functional as can be.

It is hard for elderly to mobilize easily and they want to communicate on screen, for this reason the keys, the screen and the letter size of the phones must be bigger than normal ones, and also sound and colors of the screen must also be accurate. The background must not be blue.

As technological development are very far for TV and their remote control devices are also very complicated, but elderly want very simple tools that don't mix their head like just big on off, forward backward keys. And also the colors of the screen should not weary the eyes and the sound must be accurate.

Keywords: elderly, simple tools, phones, remote contro

BR-046**Medical Law As a Routine Course in Medical Education**

Rabia Adeviye Aktas

Department of Family Medicine, Cumhuriyet University, Sivas, Turkey

As physicians we do a hard work, we put our lives on it, study hard, work hard, everything seems hard about being a physician. But if I was asked the hardest day of my career, I -with no hesitation- could say, it was the day I went to the court for a code white statement. Code white is an emergency code in Turkey, as in most other countries, pointing to an aggression or violence to health care workers. The day was the hardest, because I was a stranger in that world, my homeland was the hospital not the court; I felt completely defenceless. After the trial (the judicial process is still ongoing, though) I had enough time to think why it was so challenging. Now I know the answer: It is because of my lack of knowledge about law. I know nearly nothing about law but the truth is that a great deal of our work is directly related with law. For instance there are written regulations and codes on how a physician has to examine when giving a health certificate for a marriage, a driving licence, or a job application. I can give a lot more examples, the emergency cases, the prescriptions of addictive drugs, the blood alcohol tests, surgeries, the informed consents of the patients... These are all legally regulated conditions of our profession. In fact non of us has enough knowledge about the legal rules but we have to. We may even be breaking the law while believing it is absolutely true for our patient. Finally, my proposal is that medical law should be a routine course in the medical college educations. I do not mean forensic medicine or bioethics, what I mean is real medical law from real lawyers must be taught to medicine students.

Keywords: medical law, education of medicine, courses, forensic medicine, ethics

BR-047**The importance of getting out of the comfort zone: new experiences in different fields**

Carolina Martins Moreira

Serviço de Medicina Física e de Reabilitação - CHP, Porto, Portugal

Justification:

Nowadays, with a crescent number of physicians, the importance of each one different experiences is increasing. Our clinical practice will reflect our background context and it will be valued the most, as more different experiences we reached.

The capacity of adaptation is a requirement that makes the difference as new adventures and work experiences lead to new social tools, of utmost importance in our clinical practice.

In my short career I've spent a month doing medical voluntarism in Cabinda, Angola in 2009 and recently I've done an internship in aerospace medicine UTMB-Nasa in July 2014. Those were two incredible experiences in complete opposite fields that in different ways changed my medical point of view and my clinical practice.

Content:

Doctors that had an experience in different fields or in extreme situations would tell what did and learned from it and how it changed the way they see their medical work.

- Different medical approaches
- Capacity of adaptation in different medical fields
- Exchange of experiences

Keywords: adaptation, exchange, medical experiences

BR-048**Internationalization of GP/FM education: the Vasco da Gama Movement Exchange Programmes**

Sara Rigon

GP Specialist, Bologna Italy

Nowadays, globalization is a fact more than a point of view. We, as physicians, cannot afford to ignore the impact of such a pervasive phenomenon on health care systems and its consequences, starting from the increase in health professionals' mobility as well as patients' Moreover, globalization offers great opportunities to learn from one another and many universities around the world have been implementing the internationalization of their core curriculum, acknowledging the importance of intercultural competences.

What about GP/FM education? Do we see a need of internationalization of GP/FM education?

The Vasco da Gama Movement provides a range of exchange programmes for medical doctors specialising in GP/FM and junior GPs/FPs within five years of completing specialty training that offer the possibility to discover different primary care systems and educational environments. We want to share our experience and discuss the potential value of international education exchanges in GP/FM.

Keywords: general practice, family medicine, education, international educational exchanges

BR-049

Interprofessional Obesity Treatment

Susan Saffel Shrier

Department of Family and Preventive Medicine, University of Utah School of Medicine, Salt Lake City, Utah, USA

Addressing obesity in a clinical setting can be a daunting task. Obesity, like many chronic disease, require a comprehensive physical, psychological and social assessment to identify key factors contributing to weight management. There are obesity guidelines but they leave you with uncertainties on motivational interviewing, behavioral change, goal setting as well as techniques for dietary assessment. I would like to share our approach to these challenges through team based group settings and discuss options for effective obesity treatment.

Keywords: obesity, clinical approach, interprofessional teams

BR-050

Global health competencies

Emily Clark

Royal College of General Practitioners, UK

We believe it is essential that UK based healthcare professionals take advantage of opportunities to engage in global health. There are potentially great benefits to GP training and GP practice in terms of the personal and professional development of our healthcare workforce in their working and learning overseas, and in the integration of global health learning into the UK GP training curriculum.

Since the publication of Lord Crisp's report, Global health partnerships: the UK contribution to health in developing countries, steps have been taken to support healthcare professionals who wish to volunteer in developing countries. The Academy of Medical Royal Colleges in the UK has taken the lead on this. A set of benchmark competencies in global health, particularly focused on volunteering, are being developed. Furthermore, the many barriers and challenges faced by professionals are being recognized.

How do these compare to other countries and WONCA regions? Are competencies in global health really generic or are they country specific? We would be interested to hear from delegates from other countries and regions as to how these compare and discuss whether we have common ground as to what 'competency in global health' truly means. We would also be interested to hear whether primary healthcare professionals in different countries face similar challenges and barriers to being involved in global health as we face in the UK.

Keywords: Competencies in Global health

BR-051

Communication in Primary Care

Nazan Karaoglu

Medical Education and Informatics Department, Meram Medical School of Necmettin Erbakan University, Konya, TURKEY

Although it is obvious that communication is important to enhance patient outcomes, supports well being and satisfaction of both doctors and patients, effective in health care and cost effective it is no understandable why we still have problems in this area.

When we ask to doctors, beginning from the medical students, they know and they note that they believe in the advantages of effective communication but in practice patient see a different face of a doctor. It seems that the doctor who believes in good communication transforms to a new one who acts opposite. Unfortunately, physician-patient communication has frequently been judged to be inadequate although physicians claim that they communicate adequately.

I made some interviews with patients and with healthy individuals and with doctors (medical students, practicing physicians, residents and academicians). It was really very interesting to witness this paradox while I was listening their stories, experiences about patient doctor relationship. It is obvious that there is a misunderstanding and ambivalence about communication.

Many articles say that there is a need for formal communication education during medical education process and they note that medical educators should focus on teaching communication skills and the effects of physician behavior on patient outcomes. The literature also adds that "only a minority of medical students and physicians receive formal communication training using curricula that are proven to contribute to better patient outcomes. Communication skills should be taught widely by faculty with expert knowledge using standardized patients for uniform assessment and feedback".

I want to go further and want to claim that if doctors do not believe themselves that good communication is useful and internalize good behaviors patients understand it and patient doctor interview end with dissatisfaction. There is a need of research about understanding the roots of this ambivalence of doctors by qualitative studies.

Keywords: communication, physician, patient, medical education

BR-052

Electronic Health Records

Cemal Kavasogullari

Innovative Healthcare Solutions

In an age where we have direct access to a live feed from a connected webcam in a rainforest in Brazil, in an age where we are beaming wifi connection via automatic drones, it is beyond comprehension that we still struggle with simple access to meaningful medical health records. CALDICOTT principles in the UK involves the duty to "share information" as well as to protect it since 2012.

There still are ethical issues around the ownership and access to this sensitive information and only recently trends are moving towards allowing patient access to their medical health records in an easier and more intuitive way. This delay is also partially due to the resistance from ourselves, the medical community. But why the fear? Why are doctors afraid of patients having access to their very own records?

And from the technological point of view, why have we so far failed to create a successful system to allow efficient and secure sharing of information? Compatibility, storage, security and ownership are some of the main obstacles we have encountered.

Yet I believe this is not enough. Patient's should not only have merely "access" to their health records but also have the ability to create them. Connected health is on it's way and we have to position ourselves as GPs in the

best possible way to receive the forthcoming wave.

I would like to open to discussion a new idea that may solve some of this issues: Give patients the responsibility of their own health records. Let them hold, transfer, share and ensure the security of their own data in an electronic format. A new approach to an old way of handling medical records.

Keywords: EMR, electronic health records, personal health records

BR-053

Violence in Health

Vishal Mallusingsh Baghele

Department of family medicine, Sir Ganagram hospital, New Delhi, India

Medical violence is very serious issue now a days. Its raising issue in developing countries like India. We read news regarding this everyday. This is very common at primary health center where there is poverty, backwardness, lack of education and lack of security guards. In India doctors are being beaten everyday even at tertiary level. Strict laws has been made, but government is unable to protect doctors till today. Due to this, doctors are avoiding to go to primary health centres.

But medical violence can be prevented by making certain protocols, rules, strainghthing security of doctors etc. Proper health education should be given to the people. Information regarding medical violence should be added in medical education carriculum at undergraduate level.

Keywords: Developing countries, medical voilence, doctors

Broken glasses of hospital

Doctor was beaten badly by patient relatives

BR-054**A Good Enough Death (An Honourable Death)**

Riitta Anneli Heiskanen

Department of Public Health Services, Helsinki, Finland

Death and the meeting of the grieving family is one of the most difficult tasks of a physician. During my quite long practice (since 1970) in quite various fields of medicine (adult & neonatal reanimation, children's transport, adult & child psychiatry, general practice, school health) I have had time to analyze my behaviour as well as my colleagues'. Especially when I was young I was often put in the responsibility of confronting the family in these sensitive situations. This has probably marked my character as a physician most.

My parents died in 1981 & 2013 at hospital in quite similar medical conditions, but in opposite "holding" situations. My former husband died in 2013 at hospital; the way our daughters were not met at the death of their father was shocking. The general behaviour towards death has changed with the development of our societies and the widening of our knowledge; the discussion of the emotional impact has almost disappeared.

In Finland today we are not allowed to "simply" die; on the death certificate we must have a primary and a secondary diagnosis and the general conditions. This can often be very difficult to even the family practitioner.

A taxi driver told me the death of his grand-mother at the age of 102 during her siesta next to her grand-son; this made me think of one of my first reanimations, a lady of 104 years brought to the hospital for a cardiac arrest.

An oral presentation to give birth to a discussion of as well personal as general opinions on death and its confronting.

Keywords: death, emotions arousing, behaviour

BR-055**Informed Consent in Primary Care**

Yasemin Kılıç Öztürk

Izmir Tepecik Training and Research Hospital, Family Medicine Clinic, Izmir, Turkey

One of the most stressing things for me is to develop and have written consent for each management during my daily practices. Informed consent is one of the most important part of patient rights in clinical practice. As family medicine is a comprehensive discipline there is a wide range of managements in daily practice (injections to operative procedures...) We need so many different forms for each. I usually report on the database that "necessary information is given and approval is taken" and do not have written consent for basic interventions such as injections and vaccinations. I have a challenge that this may be a legal or an ethical problem. Do you have written consent forms for each different managements? How do you deal with such situations?

Keywords: approval, family medicine, daily practice

BR-056**How could psychotherapy lead to maintain weight after diet?**

Patrick Tabouring

Université du Luxembourg, Luxembourg, Luxembourg

Justification

It is doubtlessly as difficult to maintain the weight acquired by diet as to make it to lose the excessive kilos during the diet. The return to the initial weight, even its exceeding, is much more frequent than maintaining it. The patient as well as the GP risk to have a feeling of useless effort and to feel themselves so much more discouraged. It is important to remedy this situation, as obesity concerns a growing proportion of patients and causes problems to public health.

In addition, much of our obese patients feel a strong psychic suffering.

Content

I am working in a group practice with high share of obese patients due to the nutritional activities of my GP colleague. Despite the impressive results of her diet prescriptions, I was worried about the great number of returns to initial weight or even exceeding it. In view of the similar statements in public health, I ask the question why one does not reach continuous results.

Compared to other chronic pathologies (like fibromyalgia), where the identification of a particular psychopathologic profile has made extraordinary results, obtained by an adapted global and psychotherapeutic care, I'm questioning myself about the common psychopathologic patterns to obese patients and their expected benefic results by an appropriate psychotherapeutic model.

Following first interesting observations but in view of partly unsatisfactory results, I would like to exchange experiences with other GP's, hoping that their contribution would make possible a shared consensual improving in our future approach of obese patients.

Keywords: psychotherapy, obesity, suffering, consens

BR-057**Effect of Media on Health**

Yusuf Karayürek

Department of Family Medicine, Sevket Yilmaz Training and Research Hospital, Bursa, Turkey

Media affects our lives in all aspects including health. Diabetes Mellitus has been more commonly discussed on TV programmes than it has never been before in Turkey. For example, indications of oral glucose tolerance test (OGGT) during pregnancy is one of the items discussed on TV. I have observed that patients' behaviour have been significantly changed to do or not to do OGGT. I would like to discuss usefulness of OGTT during pregnancy and new trends on this topic among patients.

Keywords: oral glucose tolerance test, pregnancy, diabetes mellitus, media, television programmes

BR-058**Defensive Medicine in the Family Medicine**

Giray Kolcu¹

¹Selçuklu Community Health Center, Konya, Turkey

²Karşıyaka Community Health Center, İzmir, Turkey

³Department of Endodontics, Selçuk University, Konya, Turkey

⁴Department of Family Medicine, İzmir Katip Çelebi University, İzmir, Turkey

Defensive medicine practices are the medical practice deviations that physicians apply for the purpose of protecting themselves against malpractice lawsuits. There are two main forms of defensive medicine practices. Assurance Behavior (positive defensive medicine), being non-advantageous to the patient neither marginally nor medically, adds services for adverse events which may be resulted with medical malpractice litigations that are accepted by the service standards of the legal system. Avoidance Behavior (negative defensive medicine) is the behaviors that physicians perform in order to protect themselves from legal risks. Among these, actions are included such as rejection of the high-risk procedures and conditions, avoidance of invasive procedures and removing the high-risk patients from the list of operations.

This behavior is a matter of debate all over the world, and in various studies done regarding physicians, high rates were found. In our study we have shown this prevalence.

How about sharing your opinions on this behavior that vocationally puts physicians in a difficult situation, such as creating negative motivation on physicians, having negative impact on costs, giving damage to patient?

Keywords: defensive medicine, family medicine, malpractis

BR-059**Entering Diagnosis or Problems by Family Physicians in Electronic Health Records**

Adeel Nazir Ahmad

King Faisal Specialist Hospital and Research Centre Jeddah Saudi Arabia

As a family physician seeing patients presenting with various problems, not knowing their ongoing or past medical problems can have a major impact on their future management. With partial electronic health records, while documentation is still on paper, it becomes even more important to ensure physicians enter a diagnosis or problem (in the form of ICD9/10 code) in the electronic records.

In a new job, with no patients files and unable to see any recorded past medical history or recent patient presentations in the IT system, I had considerable difficulty in managing patients with multiple medical problems not being sure of their past medical history. I felt the need to initiate a performance improvement project to improve entering diagnosis and problems by family physicians. Lack of awareness of the importance of this, trying to find an appropriate ICD 9/10 code by the physicians and time consumed by multiple clicks involved in trying to navigate around the IT system has been a major obstacle. What would be the best way to address this issue? With everything being automated, do we need physician assistants to help with our electronic documentation while we concentrate on what we should do best, ie managing patients?

Keywords: diagnosis, problems, family physicians, information technology,

BR-060**Deprescribing to address polypharmacy and potentially inappropriate medication use in the elderly**

Katharine Ann Wallis

Department of General Practice and Primary Health Care, The University of Auckland, New Zealand

Polypharmacy is a leading risk factor for adverse drug reactions and avoidable adverse drug reaction hospital admissions. Polypharmacy is common in the elderly and becoming more common as people are living longer with more chronic conditions. Many medications that the elderly take are potentially inappropriate. Deprescribing is the process of tapering and withdrawing medications. Deprescribing is integral to optimal prescribing but there are many barriers to integrating deprescribing into medicine's culture of prescribing. Doctors may not think polypharmacy is a problem, or know which drugs to stop when and how; they may fear upsetting or offending the patient; they may find the process too time consuming; or they may fear poor outcomes or legal repercussions. I would like to hear your experience about deprescribing potentially inappropriate medication in the elderly. In particular, I would like to know what you consider to be the barriers to deprescribing and the factors that aid and abet you deprescribing in practice.

Keywords: Polypharmacy, adverse drug reactions, elderly, deprescribing

BR-061**Empowerment for solving problems with the patient**

Diana Dominguez Jimenez

GP trainee at the Health Centre of Estepa, Sevilla

One thing that shocked me the most when I started practicing, was that most of the time in primary care is that people was not asking me for health problems but for advice for matters in their daily life. That terrified me, because in the six year of university no one had prepared me for that. Sometimes I found myself wandering about how was I going to give advice in life if I still was asking also for them, and how was I suppose to do it not someone my age, but people that could be my parents.

I read a lot to learn how to manage that kind of situations, with my tutor learned some approaches to certain matters, etc.

After researching, trying, failed and learn how to elaborate a good relation of trust wit the patients, sometimes I don't wait for the patient to ask me, if the person is troubled I ask about, and surprisingly most seemed released, because the were worried not to trouble me with their personal stuff.

Along with my tutor and help for a psychologist friend of mine, we have elaborated a compilation of readings to give the patient, that can help in different situations, for reading at home. the they come again and we talk about thoughts, feelings, etc. while reading it and how apply the things learned in their life.

That method has been useful for us, but there could be so many ways depending of the abilities of the practitioner and the patient, that I think it can be very useful to have a discussion about aproaches and share resources about this topic.

Keywords: problem solving, patient empowerment

BR-062**Anticoagulation: To do or not to do? And how? That is the question!**

Ana Sofia Pena

USF Samora Correia, ACES Estuário do Tejo, ARSLVT, Portugal

We have tools (CHADs-VASC2, HAS-BLED) that help us to decide whether start or not anticoagulant agents in a patient. But this decision is not always straight and simple.

Nowadays there is an extended offer of anticoagulant drugs and we, as family physicians, are in a prime position to better start and manage this treatment.

We know the studies about these drugs, the advantages and disadvantages of each one and we have guidelines.

But we also have a lot of different patients and issues.

There are the politics, costs, patient's ability, medical conditions and financial status. We can know and trust or not in old and new anticoagulant agents, we can feel comfortable or not in prescribing them, we have poor and disabled patients, patients with comorbidities, with impaired kidney or liver function, we have otherwise healthy patients... We have a lot of different situations.

So, what to do in each one in what concerns to anticoagulation?

Keywords: anticoagulation, different patients, costs, ability, comorbidities

BR-063**From NASA to a Refugee camp - perspective from a Family Doctor**

Pedro Caetano

USF Nova Via - CHVNG, Porto, Portugal

Purpose of the activity - Share of experiences and different types of actions, backgrounds and roles from Family doctors.

Count - As a young doctor, I believe doctors should have the most experience possible in different backgrounds. As a resident doctor of family medicine, I had the opportunity to work in two of the most unique and extreme places in the world, that gave me another way to look at the world.

I had the chance to learn and practice in NASA and to see a place where the resources are almost unlimited and where innovation and research are a common in a daily basis. To participate in the course of Aerospace Medicine in Houston, provided by UTMB and NASA, was a way to look at the future and to see what medicine will be and how it can change in a few decades. As a future family doctor, I will not manage to treat and take care of patients that have been exposed to extreme conditions like microgravity, acceleration, ionization or pressure, but I can take advantage of the research that is being made and see which are the countermeasures that are being developed to combat some medical situations that are also common to a general practitioner work such as glaucoma, musculoskeletal conditions or fluid redistribution.

Luckily I had the opportunity to compare between two opposite worlds, values and to understand the needs of a large part of humankind. I had the chance to experience the daily life of a humanitarian doctor in MaeLa Refugee-Camp in Thai-Myanmar border with SMRU Oxford, and to give some humanitarian help the Burmese people.

Topics - Exchange of experiences and adaptability to different environments from Family doctors in different roles that played as family doctors around the world in a variety of fields.

Keywords: experience, space medicine, exchange, refugee camp, humanitarian work

BR-064

How to deal with complaints in primary care

Gabriela Cristina Elena Badea

Peartree Lane Surgery, Welwyn Garden City, UK

As a GP trainee, working in a multicultural society, I received a complaint from a patient. I felt very upset and after reading the letter I went straight to the notes to check my entry. I have also discussed with my senior colleagues and felt relieved that everyone agreed with my medical management.

It is very difficult to get a formal complaint, and this makes you question your knowledge and your skills. I was surprised that doctors do not talk about this openly, and there is no support to deal with a complaint. This can make you feel isolated, even when you did not make a medical mistake.

Patients coming from different backgrounds have different expectations from the healthcare system. How do we address this? What is your experience in dealing with a complaint and what is the complaint procedure in your practice?

Should we talk about this more openly?

I would like to share my experience in dealing with this complaint and I would be happy to get your views on this!

Keywords: complaint, expectation, healthcare system

BR-065

The “Big Data” Patient

Naldy Parodi López

Närhälsan, Västra Götaland, Sweden

Justification:

I am used to have many patients, most of them young people, who know exactly what kind of treatment they need. The potential disease is quite well known by them. When I ask the patient: How do you know that? Have you been with another doctor? I always hear: No, I read about it in the Internet. That answer surprises me frequently. A person who is well informed about how to handle a disease, what kind of laboratory tests we should order and where to be sent in order to have further investigation is always a challenge!

Content:

Meeting a patient who is almost sure about a diagnosis is not easy. Sometimes, they come with a list of symptoms and laboratory tests they need. The issue is that somehow my medical approach is conditioned by that suspected diagnosis and it is not easy to escape from that investigation line. Extra laboratory tests, more workload and wasting time is the result of that.

Is that defensive medicine? Yes, I think so. It is defensive medicine since I feel the pressure to exclude a disease because of a patient's newly acquired medical knowledge. The combination of not verified medical information on the internet and fear of illness brings negative consequences to patients increasing their anxiety and to the Healthcare System rising the cost.

However, there are some patients who are right. I met a 17 years-old women who wanted a derivation to a specific hospital for breasts operation. She had breasts deformity. I did not know the diagnosis but she illustrated me, tuberous breasts. This patient had already been in contact with the hospital which do plastic surgery for that condition and just wanted a medical derivation. That is a well informed “Big Data” patient!

Keywords: Internet, Healthcare System, Anxiety

BR-066**Pulse Measuring in Clinic**

Suat Sincan

Student Health Center, Ataturk University, Erzurum, Turkey

Dehydration is very important that patients with prediagnosis influenza especially. Therefore, I measure the pulse of every patient with pulse oximetry or digital sphygmomanometer for arm. Patients are often surprised to see hands on a device fitted electronically sounds. Everytime, I tell the patients with high pulse without fever that hydration is very important than drugs. Such patients are often told they can not get enough fluids. Only with measuring pulse oximeter, I would be directing the attention of the patients received adequate fluid. In this way, my patients become happy and satisfied and go to their sweet home as psychologically relaxed.

Keywords: Flu, pulse-oximeter, Hydration

BR-067**One country, two types of medicine**

Laura Montesinos Ramon

Centro de Salud Burjassot 1, Departamento de Salud Arnau de Vilanova-Llíria, Valencia, Spain

We have made an exchange in USA with the FM360^o program (VdGM) in 2015. We would like to tell European Family Medicine Doctors our experience in Chicago and in Plainville (Kansas), because it is one of the most interesting things we have ever done during our residency as a Family Doctor. The opportunity to stay in two different areas, the rural one in Kansas and the urban one Chicago, has given us a general view of the country and we have learnt a lot about the American medicine and the american culture. In the village everything goes slowly and the medical resources are less than in the urban areas. As well, the number and the kind of patients is different. In Kansas people are older than in Chicago, and Doctors there, know the patients, their families, their problems, the kind of life, this give rural doctors a lot of information of the patients and the relationship between patient and doctor in more fluid and close than in the city. With this experience we have learnt a lot about The American Health system as well. It is very different if we compare generally with our European health systems. The big part of the American system is private and managed by Insurance Companies, but nowadays things are changing, and we have had de opportunity to see this. Now, exists "Obama Care". This new system allows that people without money can access to the health system, sometimes with restrictions but they can have medical basic assistance. We recommended to others residents and physicians this experience, because gives you the opportunity to learn about other health system, compare it with yours, and teaches you to understand the best things of our health systems and to learn the things that can be changed or modify.

Using teledermatology effectively in rural Primary Care settings

Josep Vidal Alaball

EAP Artés, Gerència Territorial de la Catalunya Central. Institut Català de la Salut. Catalunya & semFYC Rural Working Group. Spain

It has been known for the last 2 decades that telemedicine provides better access to users in addition to reducing the waiting time between diagnosis in primary care and hospital.

In the Catalanian central region, two counties, Bages and Berguedà, have developed a teledermatology programme, which have had considerable success in reducing waiting lists while having wide acceptance among patients. This service is especially useful in rural areas where has been able to attend thousands avoiding unnecessary trips.

I would like to share my experience first as a manager implementing the teledermatology programme in 2010 and now working as a rural GP and actively using this service in my day-to-day work.

Building up a Family Health Center

Nilgun Yapan Goral

12th Family Health Center of Sehzadeler County, Manisa, Turkey

I made a contract to settle 12th Family Health Center of Sehzadeler County at Manisa Province on 1st of December, 2015. After I signed the contract, first 3 months was a tough and costly period of finding a suitable property, construction and obtaining essential equipments required for an A class family health center unit. On 2nd of March I began working as Family Medicine Specialist. According to my contract I had to get at least 1000 patient registrations to my own unit during the first year. So I prepared brochures and arranged meetings to introduce our unit. While my similar colleagues have to make 60-100 outpatient examinations, I had only 10-20 on daily practice. By this way I could ideally perform recording my patients' informations, preventive medicine, screening programmes and personal consultations.

New Family Health Center

BR-070**Differences and similarities between the family medicine systems of Turkey and Spain**

Burcu Başaran

Department of Family Medicine, Marmara University, Istanbul, Turkey

I want to share my exchange experience with all family medicine practitioners. It was a very useful and enjoyable experience for me. I have spent two weeks there. First of all I had looked the site of Vasco De Gama, participating country link to choose the country, which I wanted to go. Then I choose the clinic. This was a very big chance for me, if it is possible everyone must try this experience. I offer everyone. If you join my BRITE session you will also learn lots of things about differences and similarities between the family medicine systems of Turkey and Spain.

Keywords: family medicine system, Turkey, Spain

BR-071**BRITE: Socio Economic Situations and Health Care**

Clare Wilson

Severn Deanery UK

Title: Working with prisoners

One of the hardest group of patients I work with in primary care is ex prisoners. They often arrive from prison with no health records and requests for medication with risk of addiction, they have huge often unaddressed health needs and precarious social situations. I end up booking follow up appointments to deal with these multiple issues but these are often not attended. If a prescription is issued I often only gave a week's supply of medication to ensure that the patient attends a further review. How do you tackle the varied physical and mental health needs of ex-prisoners often including drug dependency and how to you keep them engaged with their health?

Keywords: Prisoners, socioeconomic problems, health needs

BR-072**How Can We Diagnose Obstructive Sleep Apnea in Primary Care?**

Senem Buğdaycı

Department of Family Medicine, Marmara University, Istanbul, Turkey

Everyday i see many patients with chronic obstructive pulmonary disease, hipertension, coronary artery disease, etc. As it is well known many complications, mainly pulmonary and cardiac diseases are associated with Obstructive Sleep Apnea (OSA). We know how important OSA is. However, to diagnose it in primary care is not easy. Polysomnography is the gold standart diagnostic test but due to the need for qualified personnel and the limited number of sleep clinics, it is expensive and difficult to reach. There are several questionnaires for screening, but their sensitivity and specificity values are questionable. Therefore a screening tool is necessary for primary care patients, to identify who should undergo polysomnography, based on their clinical symptoms, their physical examinations, and their risk factors.

What is your opinion? How can we diagnose OSA in primary care?

Keywords: Obstructive Sleep Apnea, Diagnosis, Questionnaire

BR-073**Obesity follow-up in Primary Care**

Emre Yilmaz

Family Medicine Department, Marmara University Hospital Pendik Training and Research Hospital, Istanbul, Turkey

When I decided to do a clinical research on obesity, I saw that very few patients visit the outpatient clinic. Then I called patients and asked " why don't you come over your follow up?". Almost all of the patients said that they were failed with their eating habits and increasing physical activities of daily living. They also complained about that they tried to lose weight before many times and every time lost their motivations instead of losing weight. Well, what can you recommend to increase the motivation of the patient with obesity and to speed up the process of losing weight and what are your experiences on this subject ?

Keywords: obesity, follow-up, primary care

BR-074**Adulthood vaccines: Do we suggest to our patients and do they accept?**

Hülya Akan

Yeditepe University, Medical Faculty, Department of Family Medicine; İstanbul

Expanded Childhood vaccination program in Turkey covers over 98% of children and well accepted by parents; so it is one of the best good health practice in Turkey. On the other hand adulthood vaccination is comparatively new and current topic. Some recommendations have been changed or added recently. For example pneumococic vaccination recommendations have been changed; varicella and pertusis vaccines have been added. My personal experience is that very few physicians recommend vaccination to their adulthood patients regularly and have difficulty to follow up-to-date recommendations.

Another point is that even I regularly ask to my every patient about vaccination status and do recommend needed ones, I face with a strong resistance especially in elderly. I feel that the idea of " vaccination of adults " is strange in means of senses for them.

In this session I hope to share our experiences about difficulties in adult vaccination and how to overcome barriers and also I want share the new " Adulthood vaccination guideline" that during preparation I have been a part of working group.

Keywords: Preventive medicine, adulthood vaccination, vaccination

BR-075**Assessment Of Medical Practice in Low Prevalence Diseases In Primary Care**

Giray Kolcu

Ulurmak Family Medicine Centre no. 12 in Karatay, Konya

Knowledge amount has expanded around the whole world with the rapid development in medical science. Within such intense knowledge environment, medical practice in low prevalence diseases in primary care is getting more difficult each day.

We aimed to do knowledge exchange with you in order to develop a basic patient approach model for performing safe medical practice in low prevalence diseases.

What about contributing to our perspective towards low prevalence medicine in primary care by sharing your knowledge and experiences with us?

Characteristics of the diagnosis of Violence against women in a Regional Health Service

Rosario Morales López¹, José Miguel Bueno Ortiz², José Jesús Guillén Pérez³, Celia Alshail López Blanco¹, José López González⁴, Sandra Jiménez Rejón⁵

¹Centro de Salud Cartagena-Oeste. Servicio Murciano de Salud

²Centro de Salud Fuente Álamo. Servicio Murciano de Salud

³Consejería de Sanidad Comunidad Autónoma Región de Murcia

⁴Centro de Salud Cartagena-Este. Servicio Murciano de Salud

⁵Centro de Salud La Unión. Servicio Murciano de Salud

BACKGROUND: Violence against women (VAW) is an important problem of Public Health. Primary Care (PC) is critical in its approach and the best place for early detection.

OBJECTIVE: To know more about VAW-PC cases.

METHOD: Design: Observational, descriptive, cross-sectional. The study was performed in Primary Care.

Population: Family doctors (FD) of a Regional Health Service (N=829). Selection Criteria: Systematic random sampling (n=263) (e) 5%, (p) 50%. FD Self-administered questionnaire related to their patients' medical diagnoses in the last 10 years. Variables: age, type of abuse, professional who has diagnosed the problem, existence of prior suspicion, number of medical consultations in the last year and consumption of psychotropic drugs. The statistical analysis SPSS 21.0. Approved by the Regional Clinical Research Ethics Committee.

RESULTS: Answers: 233 FP (88,59%).

Number of cases of VAW diagnosed per FD: 0: 44 FD (18.84%); 1: 54 FD (23.11%); 2: 64 FD (27.46%); 3: 38 FD (16.30%); 4: 18 FD (7.72%); 5: 11 FP (4.72%); 6: 2 FD (0.85%); 7: 2 FD (0.85%). Total: 415. Mean 1,78.

Detection: FD: 288 (70.1%); nurse: 26 (6.3%); Hospital emergencies: 26 (6.3%); social worker: 20 (4.9%); police: 20 (4.9%); Primary care emergencies: 16 (3.9%); Others: 15(3.6%)

Age of victims: 14-87. Mean: 50.

Number of consultations last year: 0-40. Mean: 8.

Treatment with Psychotropic Drugs: Yes: 268 (27.8%), No: 133 (33.2%).

Type of abuse: Physical: 267 (65%); Psychic: 290 (70.6%); Sexual: 4 0(9.7%); Economic: 60 (14.6%); Environmental: 18 (4.4%)

CONCLUSIONS: Each FD has diagnosed in last 10 years a mean of 1.78 VAW cases. The detection has been performed more frequently by FD without previous suspicion of VAW. The VAW victim's average age is 50 years, consulted on 8 times to their FD in the last year and consume psychotropic drugs. Mental and physical are the most frequent types of abuses suffered.

Knowledge, attitudes and skills of Polish physicians in management of domestic violence

Anna Krztoń-Królewiecka, Katarzyna Nessler, Monika Storman, Jolanta Majchrzak-Król, Izabela Jałowiecka, Anna Tarczyńska, Adam Windak

Department of Family Medicine, Jagiellonian University Medical College, Krakow, Poland

BACKGROUND & AIM:

Domestic violence is a significant worldwide problem. Domestic abuse is more prevalent among women seeking healthcare than in the general population. Healthcare professionals, especially family doctors, are potential sources of support for victims of domestic violence. The aim of the study was to analyze Polish doctors' knowledge, attitudes and skills in identifying and intervening in cases of suspected abuse.

METHOD:

A cross-sectional survey was carried out among 250 randomly selected doctors in Poland. The study tool was a translated and adapted for use in Poland version of developed and validated in the United States questionnaire PREMIS - Physician Readiness to Manage Intimate Partner Violence Survey. The anonymous questionnaire included five sections: respondents' characteristics, perceived readiness and knowledge, practical issues, actual knowledge and opinions. Descriptive statistics and Chi-square test were used for statistical analysis.

RESULTS:

The response rate was 52,4%. Every third respondent had a specialization in family medicine. The majority of respondents (72%) feel that they do not have sufficient training to assist individuals in addressing situations of domestic violence and 62% think that doctors do not have enough time to help patients with domestic abuse problem. Almost half of respondents (47%) faced or suspected domestic violence case in their practice. The plurality of doctors (87%) took some actions in the suspected case of domestic abuse, this was most frequently documenting the victim's injuries in patient's medical chart (85%). Lack of experience in suspected cases of domestic violence was more often declared by family physicians than other specialists (63% versus 40%, $p=0,013$).

CONCLUSIONS:

Doctors play an important role in addressing domestic violence, but their knowledge and behavior in the area seems to be not satisfying. The findings indicate a great need for a comprehensive training for physicians in domestic violence recognition and intervention.

Intimate Partner Violence (Mis)Perceptions of Turkish Men and Women

Hatice Kurdak¹, Yeşim Incecik², Nafiz Bozdemir¹

¹Çukurova University, Department Of Family Medicine

²Başkent University, Department Of Family Medicine, Seyhan / Adana

BACKGROUND & AIM: Over the past years, Turkey has been witnessing the devastating consequences of intimate partner violence (IPV). Relativeness and complexity in the perceived norms of violence may interfere with diagnosis. This cross-sectional study aims to determine IPV perceptions and experiences of men and women in primary care.

METHODS: Socio-demographic variables, IPV experiences and perceptions were investigated among the applicants of two primary care units from central Adana during one month. Of the 271 applicants, 38 were excluded. Surveys were conducted face-to-face and confidentially.

RESULTS: Of the enrolled, 70% were women. The women's mean age was 44.5±13.1 and men's was 47.0±14.9. Among participants 97.1% men and 26.2% women had their own income. Of the women 39.3% and of the men 51.4% had at least college education. All participants agreed that pushing, manhandling, hair pulling, kicking, dragging, beating, choking and threatening with knife are violence. The percentages of participants who did not acknowledge the other actions as violence are shown in Table-1. The highest misperceptions were on economical IPV. "Victims of IPV may have deserved it" statement found 41.7% supporter in both genders; 39.3% women and 44.3% men agreed on "violence is a private matter, not the business of others" statement. The percentages of participants who answered, "yes" to the sexual abstinence scenario and questions are given in Table-2. The IPV percentages and relations to the perception statements are given in Table-3.

CONCLUSIONS: Even tough IPV victims are mostly women; the percentages of men who experience IPV are remarkably high. The misperceptions about economical and sexual IPV are evident. We may assume that this may affect people's IPV acknowledgement, experiences and may interfere with diagnosis. Therefore understanding the IPV perceptions are essential for family practitioners who has a professional responsibility in comprehensive approach and holistic modeling while managing health problems.

Violence, Honor And Honor Crimes: The Vicious Cycle

P. Gamze Erten Bucaktepe¹, Vasfiye Demir², Ismail Yıldız³, Tahsin Çelepkolu², Leyla Erik Duman², Yeşim Cengiz Balyen², Nuriye Mete⁴

¹Family Medicine Department, Medical Faculty and Women's Research and Implementation Center, Dicle University, Diyarbakır, Turkey.

²Family Medicine Department, Medical Faculty, Dicle University, Diyarbakır, Turkey.

³Biostatistics and Medical Informatics Department, Medical Faculty, Dicle University, Diyarbakır, Turkey.

⁴Biochemistry Department, Medical Faculty and Women's Research and Implementation Center, Dicle University, Diyarbakır, Turkey.

BACKGROUND AND AIM

Violence against women is an escalating problem in the world. Despite the governmental policies, the number of women killed in the name of honour is growing each year. The underlying reason is portrayed to emerge from the perception that a dishonourable act by a woman brings shame to the family. This study focused on students to assess their attitudes towards violence, honour (ATH), and honour crimes against women (ATHCAW) and to investigate the relationship between these notions.

METHODS

The students (n=2370) were selected from Dicle University Faculties by stratified sampling method. Previously validated and reliable questionnaires, which queried the attitudes towards violence, ATH and ATHCAW were administered between February 15-March 31, 2014. All the data were analysed using SPSS 21.0.

RESULTS

The participants comprised 1088 (45.9%) females and 1282 (54.1%) males, with a mean age of 22.4±3.3 years. Eye-witnessing the violence was detected in 41.5% and being subjected to violence was found in 40.2% of the students.

The statistics revealed a positive correlation between being subjected to violence and both Machismo Scores (MS) ($r=0.100$, $p<0.0001$) and Acceptance of Violence Scores (AOVS) ($r=0.107$, $p<0.0001$).

The MS and AOVS of the students established positive correlations with the ATH ($r=0.292$, $p<0.0001$; $r=0.297$, $p<0.0001$, respectively) and the ATHCAW ($r=0.394$, $p<0.0001$; $r=0.437$, $p<0.0001$, respectively).

Some other factors effecting ATH and ATHCAW are found to be male gender ($p<0.0001$ and $p=0.001$); rural origin ($p<0.0001$ and $p=0.039$); father's education level ($p<0.0001$ and $p<0.0001$) and mother's education level ($p<0.0001$ and $p=0.003$).

CONCLUSION

Our study revealed a positive correlation between inclination to violence, ATH and ATHCAW. Violence, despite being an intractable social problem, could be solved by root cause analysis. Integrating methods for recognizing the underlying causes and terrible consequences of violence into the educational and social policies should be the first step.

Deaths of fertile women from violence in Goiânia in 2013

Lara Louise Guimaraes Silveira¹, Rickella Aparecida Alves Moreira¹, Ana Luisa Franco Moura¹, David Carvalho Resende¹, Wallace Pinheiro Rodrigues¹, Lorena De Almeida Ribeiro Prudente¹, Gustavo Aguilar Alvarenga Amorim¹, Vinicius Bernardes Mendonça Damasceno¹, Ayssa Teles Abrao Trad³, Natalia Jacomo Auad⁴, Natalia Carasek Matos Cascudo¹, Camila Garcia De Souza²

¹Universidade Federal de Goiás, Goiás, Brazil

²Pontificia Universidade Catolica de Goias, Goias, Brazil

³Pontificia Universidade Catolica de Sao Paulo, Sao Paulo, Brazil

⁴Centro Universitário Municipal de Franca, Sao Paulo, Brazil

Background & Aim

Urban violence is an evil that plagues all communities living in urban centers. It covers any action that reaches the laws, public order and people. There are many causes of violence, such as unemployment, trafficking in general confrontation between rival gangs, lack of political influence, sexism, discrimination in general and many others. Although all causes cited, the most important of these is the poor distribution of income that results in the deprivation of education and better housing. All this vicious circle originates from the lack of conditions for a dignified life that makes people traverse illegal and criminal ways.

Method

It is a descriptive research carried out in the Health Information Division of the Department of Epidemiology of the Municipal Health Department of Goiânia-Goiás. It was used as a collection tool women from death certificates of childbearing age (10-49 years) living in Goiânia with the DATASUS data. The period of investigation corresponds January to December 2013.

Results

In 2013 471 women were killed at childbearing age, and of these 82 women (17.4%) died as a result of urban violence (here considered as homicide and car accidents). Deaths can urban violence together are the leading cause of death of fertile women in Goiânia cited above period.

Conclusions

Thus we can conclude that the mortality of the population goes beyond policies aimed just health care. It is very important that public policies about safety, sanitation, education and others are strengthened so that people get their basic right to health and life that is enshrined in the Brazilian constitution.

The motivation's wall

Silvia Membrilla Pastor, Maria Àntonia Requesens Catalan, Nuria Pérez Gutierrez, Maria Josefa González Irigoyen, Laura Illamola Martin, Annabell Torres Rodriguez, Esther López Gonzalo, Gemma Moreno Fernández, Jordi Juncosa, Maria Rosa Luna Gámez, Elena Ramos Corbella

CAP RAMONA VIA. EL PRAT DE LLOBREGAT

BACKGROUND

In recent years we are experiencing a constant discomfort in our care work. Dada the economic situation and cuts in health budgets there are difficulties in the organization and in compliance with protocols, lack of staff and saturation of the consultation do we present a high degree to burn out. This involves different decision-making from the direction of the health team with goals that fail to achieve the level of success they would like. It is not always easy to manage assistance well and optimize results. Demotivated staff. Address disappointed. Difficult empathy.

TARGET

Improve the motivation and welfare of the health team

METHOD

We decided change the messages received with negative tone for positive messages, acknowledgments, and any manifestation optimistic reflections on a positive way we think we can share with our colleagues.

Given the viral effect of Facebook we decided to share all that on a wall: the Motivation's wall. It hangs in the coffee hall to enhance the positive meeting.

At the beginning of the experience we spent a MBI (Maslach Burnout Inventory) test to determine the previous state of the participants.

The wall remains suspended for one month and after people again pass the test.

CONCLUSIONS

The numerical results (changes expected test score) are awaiting the final count. Subjectively we have seen signs of improvement in sharing more whiles in the coffee room which speaks about the wall and less comments in negative way like complaints. Daily reading of positive sentences, involving people outside the team who have felt attracted by the proposal (paramedical staff, staff from the hospital who attend on another floor of our center, etc) and working together have done carry out participatory team and changing to positive attitudes

Turkish primary care has undergone a drastic change starting in 2004. Now, 21,175 family physicians (FPs) provides health care at 6,756 family healthcare centers. Each FP has an average of 3,621 registered patients. In a previous study we analyzed a working day of a FP and we found out that more than a quarter of a FP's daily workload consisted of prescription requests of their patients (28%). We aimed to evaluate the characteristics of these requests in order to have a better understanding the reasons beyond such frequent requests and help physicians and healthcare decisionmakers to take necessary actions to alleviate this burden.

21 FPs from 19 different cities in Turkey participated in the study. The participants were asked to record number of prescription requests all day and the first 20 drugs requested from the patients each day and the characteristics of these requests in working days of a week.

Majority of the patients described their requests by showing the box of the drugs (36,6%). 34% of all prescription requests were with an exemption report issued at secondary or tertiary healthcare facilities. The patients with exemption reports most frequently requested drugs for essential hypertension, diabetes mellitus type 2 and chronic obstructive pulmonary disease; respectively. They have been using these drugs for an average of 4,14 years. Majority of the requests without an exemption report were found to arise from the patients' desire to continue the same drug once prescribed by a doctor for the same complaint (56%). The most frequent three complaints for these requests were stomachache, headache and abdominal pain; respectively. Of these requests 8,2% were off-label use and 17,7% of these drugs were used in an incorrect fashion.

An important portion of prescription requests to FPs arose from other healthcare facilities

Neurophobia; an Mthy or an Unpleasant Fact for Primary Care Physicians in Turkey

Bektas Murat Yalçın¹, Özlem Midik², Onur Öztürk³

¹ONDOKUZ MAYIS UNIVERSITY MEDICAL FACULTY DEPARTMENT OF FAMILY MEDICINE

²ONDOKUZ MAYIS UNIVERSITY MEDICAL FACULTY DEPARTMENT OF MEDICAL EDUCATION

³ATAKUM PUBLIC HEALTH CENTER

Background and AIM: Many primary care physicians are reported as they are not comfortable in situation which needs neurological knowledge or skills. This phenomenon is first described as “Neurophobia” which is explained as the fear of the neural sciences and clinical neurology that is due to the clinician’s inability to apply their knowledge of basic sciences to clinical situations. The aim of this study is to determine if there is a problem with the management of primary care physicians to patients who had neurological disorders.

Matherial and METHOD: This is a cross-sectional analytic study. A total of 384 primary care physicians who were attending the 5th, 6th and 7th meetings of the Family Practice Academy Research Days between May 2014 to April 2015 (They were held at Çanakkale, Ankara and Hatay) were included into the study. All of the participants answered a 16 question survey (Ten point Likert 1=mostly disagree, 10=mostly agree) comparing their general interest, favorability, professional confidence, perceived hardness of several subspecialties. They also ranked the most common neurological problems / diseases they encountered and their confidence of performing neurological physical examination.

RESULTS: Neurology is the second most disliked subspecialty (5.66 ± 0.8), second perceived hardest to practice (5.65 ± 2.6), and second subspecialty they feel unconfident in clinic (7.6 ± 0.9) (first subspecialty was oncology in all three items). The most frequent neurologic disorder they encounter was headache (7.7 ± 0.6) and the most frequent neurologic disorder they refer was paresis (8.72 ± 0.9). Most of the physicians stated that they (302, 79.0%) they didn’t feel full confident about to perform a neurological physical examination. Physicians stated that they mostly unable to perform a fundoscopic physical examination (345, 90.3%).

CONCLUSION: Neurophobia may be an important problem for primary care physicians. Neurology should be added to family medicine residence curriculum and this problem should be solved with rotations.

OP-009

Brief interventions to prevent recurrence and alcohol-related problems in young adults following an alcohol-related event: a systematic review

Victoire Merz¹, Juliette Baptista¹, Dagmar M. Haller²

¹Faculty of medicine, University of Geneva, Geneva, Switzerland

²Adolescent and Young Adult Program, Geneva University Hospitals, Geneva, Switzerland

Background & AIM: acute alcohol intoxication is a major concern for public health in terms of somatic, psychologic and social risks. Whereas brief interventions addressing harmful alcohol use in adults admitted to emergency wards have been shown to be effective, interventions aimed at adolescents tend to be less conclusive. We put forward the hypothesis that young adults (18 to 24 y-o)(who share developmental characteristics with adolescents whilst receiving care in adult services) could benefit from interventions to reduce the recurrence of alcohol-related events and their consequences when admitted to emergency wards following alcohol intoxication.

METHOD: PRISMA guidelines were followed to conduct this review. We searched Medline, Embase, Cochrane and PsychINFO until March 2014. The retained articles had to fulfill the following criterias: randomised trials of brief interventions on young adults (18-24 years old) admitted to an emergency ward following an alcohol-related event. The main outcomes were the effect on alcohol consumption in terms of quantity and frequency, and the alcohol-related risks. A descriptive analytical approach was adopted.

RESULTS: four trials (n=618) were included, comparing a brief motivational interview with usual care (2 trials), personalised feedback or an educational brochure. In two studies motivational interview was significantly associated with a reduction in alcohol-use whilst two studies showed no effect. Successful interventions were either delivered at a distance from the event or included booster sessions. Motivational interview favoured a reduction in alcohol-related problems in all but one study. Benefits were sustained over twelve months.

CONCLUSIONS: the evidence is inconclusive but the most effective interventions include at least one therapeutic contact several days after the event. Further research should provide more guidance about effective interventions in this age-group, including the potential role family doctors can play in the follow-up of young people after an alcohol-related emergency admission.

Background & AIM: Several lifestyle factors and comorbidities have been linked to an increased risk for Community-acquired pneumonia (CAP), although their prevalence has not been well documented. The aim of this study is to assess the prevalence and distribution of risk factors in primary care CAP.

METHOD: Retrospective observational study in adults with CAP at primary care in Spain between 2009-2013, using the National Surveillance System of Primary Care Data (BiFAP).

RESULTS: 28.413 patients. Mean age (standard deviation): 60.5(20.3) years. 51.7% males. Average prevalence of comorbidities was 71.3%, which increased with age, doubling the risk in males by the age of 75 (females 20% vs males 40%). From 55 years of age at least one risk factor (RF) was identified in 85.7% of cases: 1 RF(23.8%), 2RF(23.4%), 3 or more RF(38.5%). Major risk factors were: metabolic disease(27.4%), cardiovascular disease(17.8%) and diabetes(15.5%). According to gender: a) women= metabolic diseases(26.9%), depression(20.0%), anemia(15.8%); b) men= metabolic disease (27.8%), cardiovascular disease (20.5%), diabetes (17.9%). According to age: a) 18-25 years= poor dental hygiene(9.1%), smoking(8.0%), asthma(7.8%); b) 25-40 years= smoking(13.5%), poor dental hygiene(10.0%), anemia(7.1%); c) 40-55= smoking(20.9%), metabolic disease(17.7%), depression(12.0%); d) 55-70 years= metabolic disease(40.4%), smoking(18.3%), diabetes (17.9%); e) 70-85 years= metabolic disease(41.5%), cardiovascular disease(33.0%), diabetes(28.9%); and f) over 85 years= cardiovascular disease(39.3%), metabolic disease(27.5%), anemia(25.6%).

CONCLUSIONS: Prevalence of risk factors in adult CAP in primary care in Spain is high. Main risk factors associated are cardiovascular disease, metabolic disease and diabetes. CAP risk increases with age and doubles in males older than 75 years. Majority of CAP cases beyond 55 years of age associate at least 1 risk factor.

Assessment of patients applying to emergency department in terms of primary care

Zehra Dağlı, [Burcu Gürhan](#), Bora Taylaner, Ayşe Selda Tekiner, Ayşe Gülsen Ceyhun Peker, Mehmet Urgan
Department of Family Medicine, Ankara University, Ankara, Turkey

OBJECTIVE: The study aimed to determine reasons of the patients applying to emergency department (ED), how often they used primary care and referral chain, and how much they really needed ED services.

METHODS: Patients who applied to a university hospital ED in October 2013 and February 2014 completed a questionnaire. Patients' health conditions were determined by family physicians (FPs) through triage color coding system. Descriptive statistics were given as mean±standard deviation and percentage. Chi-square test was used for differences between the groups. Any $p < 0.05$ was considered statistically significant.

RESULTS: Mean age of 87 patients (55.2% male, 44.8% female) was 39.11 ± 19.40 years. Majority of the participants had social security (89.7%) and 88.5% perceived their conditions urgent. The most common presenting reasons were "to receive health care urgently" (68.9%), "to be treated immediately" (44.8%). The patients would not apply to ED mostly "if the procedures were faster at daytime outpatient clinics" (36.8%), "if there were night outpatient clinics" (32.2%). The patients, most of whom were registered to a FP (82.8%), presented to ED most frequently for "their own will" (44.4%). While the patients were mostly content with ED service (89.7%), discontent patients mostly complained about "slowness of ED services" (62.5%). During triage, 89.7% of the patients were coded as green, 23.0% as yellow, and 3.4% as red. The differences between having a FP and the reasons for applying to ED ($p=0.567$), the situation of patients feeling themselves really urgent and triage color codes ($p=0.317$), and having a FP and triage color code ($p=0.501$) were statistically insignificant.

CONCLUSION: Although most of the patients' conditions were mild according to color coding, they perceived themselves really urgent. The patients neither used primary health care sufficiently nor considered FP as a part of referral chain.

Hemoglobin Levels Correlate Well with the Presence of Coronary Artery Disease

[Yusuf Cetin Doganer](#)¹, James E. Rohrer², Umit Aydogan³, Matthew E. Bernard², Cem Barcin⁴

¹Department of Family Medicine, Turkish Military Academy, Primary Care Examination Center, Ankara, Turkey

²Department of Family Medicine, Mayo Clinic, Rochester, Minnesota, USA

³Department of Family Medicine, Gulhane Military Medical Faculty, Ankara, Turkey

⁴Department of Cardiology, Gulhane Military Medical Faculty, Ankara, Turkey

Background & AIM: In the present study, we sought to identify the relationship between hemoglobin levels and the presence of CAD. Additionally, we evaluated the relationships of biochemical parameters to baseline clinical characteristics in patients undergoing coronary angiography (CAG).

METHOD: The study consisted of 356 consecutive patients referred for elective CAG. Exclusion criteria included a history of prior MI within last three months, presence of neoplastic disorders or any inflammatory diseases, or overt diabetes mellitus (DM). Blood samples for hematologic and biochemical parameters were collected on admission following at least 12 hours of overnight fasting. Patients were divided into four groups based on the quartiles of Hb (Quartile I < 13.50 g/dL, Quartile II 13.50-14.70 g/dL, Quartile III 14.71-15.74 g/dL, Quartile IV > 15.74 g/dL). Additionally, patients filled out a questionnaire of asking their brief medical histories and baseline characteristics.

RESULTS: The patients with older age ($p=0.008$), male gender ($p=0.007$), in Quartile I ($p=0.003$), in Quartile II ($p < 0.001$), in Quartile III ($p=0.011$), higher WBC count ($p=0.037$), lower platelet count ($p=0.049$), condition of current smoker ($p=0.030$), higher value of fasting glucose ($p=0.014$), estimated GFR < 60 (mL/min/1.73m²) ($p=0.004$) were more likely associated with the risk of the presence of CAD.

CONCLUSIONS: The present study revealed that lower quartiles of Hb levels were independently related to the presence of CAD in subjects who were referred to elective CAG. Hb levels, which can be measured easily in almost all medical centers, may be considered as a potential predictor for the presence of CAD in patients at high risk for CAD.

Smoking and cessations habits of type 2 diabetic patients

Salih Eker¹, Burcu Dogan¹, Can Oner²

¹Family Medicine Clinic, Sakarya Training and Research Hospital, Sakarya, Turkey

²Department of Family Medicine, Bilim University, Istanbul, Turkey

INTRODUCTION:

Smoking is associated with an increased risk of cardiovascular events and death. Patients with diabetes who stop smoking lower the risk of death and cardiovascular events compared with those who continue to smoke. The aim of this study was to identify the smoking cessation interventions of diabetics.

METHODS:

Study was conducted between 01.11.2014-01.01.2015 from 125 sequential patient diabetes (75 female, 50 male) records of Sakarya Training and Research Hospital Family Medicine Clinic. For that aim type 2 diabetic patients were included to the study. Smoking habits and cessations interventions of patients were asked. Data was analyzed by SPSS 20.0

RESULTS:

Mean age of participants was 58,3±9,6 and mean disease duration was 10,3±6,6 years. 16% (n=20) of patients smokes and 33,6 % (n=42) patients was ex smokers, remaining 63 patients (50,4%) had never smokes. Current smoking patterns show significant difference according to gender of patients (p=0,000). 45% of current smokers was female, and 72% of patient who had never smokes was female. On the other hand 28,6% of patients who quit smoking was female and 71,4% was male.

Mean smoking time of patients who quit smoking was 25,4±12,4 years, and mean cigarette count was 22,5±14,7. Ex smokers patients' mean cessation time was 13,1±11,8 years. Half of the ex smokers quit smoking before the diagnose of diabetes (n=21). 11,2% (n=5) of ex-smokers took professional help, and 1 of them use nicotine bands and 1 of them use varenikline.

CONCLUSION:

It was found that every 1 in 5 diabetics currently smokes. As tobacco use increases the cardiovascular event risks of diabetic patients, all of the diabetics should be encouraged to quit smoking. But the professional help in ex smokers patients was vey low. So professional help to quit smoking must be provided to diabetic patients.

Evaluation of Diabetic Patient Care Quality in Primary Care

Selcuk Mistik¹, Ulku Elif Demir¹, Sinan Demir²

¹Erciyes University Medical Faculty, Department of Family Medicine, Kayseri, Turkey

²Erciyes University Medical Faculty, Department of Internal Medicine, Kayseri, Turkey

AIM: Diabetic patients are a big group of primary care patients. However, optimal patient care has not been achieved. The aim of this study was to evaluate all of the factors which may affect the quality of diabetic patient care in primary care.

METHOD: Diabetic patients who were being followed and treated in 36 Family Medicine Centers were included in the study. A questionnaire of 65 questions including demographic data, history and physical examination of the patients, and laboratory findings were filled out by family physicians.

RESULTS: Of the patients, 10% were type1 and 90% were type 2 diabetic patients. The mean age was 56. The ones diagnosed at primary care were 18.5%. The use of oral antihyperglycemic medicine was very common (83.9%). Metformin was the most common oral antihyperglycemic medicine used (74.2%) either alone (40.6%) or in combination with other antihyperglycemic medicine (33.6%). Forty four percent were using insulin. In the last 6 months, 84.7% had measured HbA1c values, where the mean value was 7.3. More than half of the patients had HbA1c values higher than 7% (53.5%). Eighteen percent were smoking. Twenty one percent had influenza vaccine and four percent had pneumococcal vaccine. Thirty percent had diagnosed hypertension and 24 percent had diagnosed coronary artery disease. Acetylsalicylic acid was used by 43 percent of the patients. Sixty four percent had eye examination, and 25% had neurologic examination. Fifteen percent of the patients reported hypoglycemia. Thirty percent were obeying their diets. Thirty four percent of the patients were regularly exercising. The mean Body Mass Index was 31.

CONCLUSIONS: The results of this study demonstrated us that there are many uncontrolled properties of the diabetic patients, including the glycemic control, smoking cessation, vaccination status, diet, and exercise which could be managed in primary care.

Undiagnosed cognitive impairment, health status and depressive symptoms in patients with type 2 diabetes

Paula Koekkoek¹, Geert Jan Biessels², Minke Kooistra¹, Jolien Janssen¹, Jaap Kappelle², Guy Rutten¹

¹Julius Center for Health Sciences and Primary Care, University Medical Center Utrecht, the Netherlands

²Department of Neurology, Brain Center Rudolf Magnus, University Medical Center Utrecht, the Netherlands

Background and aim

Type 2 diabetes is associated with cognitive impairment. We aimed to examine whether undiagnosed cognitive impairment in patients with type 2 diabetes is associated with a reduced health status and depressive symptoms.

Method

225 primary care patients aged ≥ 70 years with type 2 diabetes were examined, both at their homes and at a memory clinic, for undiagnosed cognitive impairment (dementia or mild cognitive impairment [MCI]). Dementia and MCI were defined according to internationally accepted criteria. Questionnaires assessing health status (SF-36, EQ-5D and EQ-VAS) and depressive symptoms (CES-D) were filled out. Health status and depressive symptoms were compared between patients with and without cognitive impairment.

Results

Patients with cognitive impairment (n=57) showed significantly lower scores on the SF-36 on six out of the eight domains, on the physical and mental summary scores, and on both the EQ-5D and the EQ-VAS scores. CES-D scores were significantly higher in patients with cognitive impairment (9.2 ± 7.1 versus 12.7 ± 8.5 ; $p=0.009$). Depression (CES-D ≥ 16) occurred almost twice as often in patients with cognitive impairment (RR 1.8; 95%-CI: 1.1-3.0).

Conclusions

Undiagnosed cognitive impairment in patients with type 2 diabetes is associated with a reduced health status and more depressive symptoms. Detection of cognitive impairment in type 2 diabetes patients identifies a vulnerable group of patients that could benefit from integrated and tailored treatment.

OP-016

Evaluating the Relationship Between Body Mass Index, Lipid Profile and Clinical Parameters in Heart Failure Patients

Fatma Gonul Dogan¹, Didem Kafadar¹, Irfan Sahin², Mustafa Hakan Dinckal²

¹Department of Family Medicine, Bagcilar Training and Research Hospital, Istanbul, Turkey

²Department of Cardiology, Bagcilar Training and Research Hospital, Istanbul, Turkey

Background & AIM: Heart failure(HF), due to new treatment methods and increasing population of the elderly, is a more often medical entity. Dyslipidemia is a risk factor for coronary artery disease (CAD) and hypertension plays a role in development of HF. It is suggested that dyslipidemia further effects HF and response to treatment. In our study, we aimed to evaluate the body mass index(BMI), body composition analysis and lipid profile of HF patients. METHOD: 120 patients (82 men and 38 women) with ejection fraction (EF) 40% or less were involved.

Sociodemographic features, comorbidities and functional capacities according to NYHA classification were asked, class IV patients were not included. BMI and body composition were analyzed with Tanita BC 418, laboratory parameters in the last month were evaluated retrospectively.

RESULTS: The mean age was 63.3 and 46.6 % of the patients were elderly, 65 and over. Most of the patients were in NYHA class II(52.5%). In women, body fat ratio and trunk fat ratio were significantly higher than men ($p<0.001$, $p=0.001$ respectively). In patient group with EF between 40% and 30%, the patients with higher fat mass and BMI ≥ 30 were significantly more than patients with EF less or equal to 30% ($p=0,036$, $p=0.013$ respectively). In men, in the higher EF(40-30%) group, BMI and the mean muscle mass were significantly higher than those in the lower EF(<30%) group ($p=0.018$, $p= 0.017$).

CONCLUSIONS: We found that EF is better in patients with BMI ≥ 30 . Fat and muscle mass may have protective effects on EF. We think that body composition may have a protective effect on cardiac function in chronic heart failure patients as it is proposed in obesity paradox. In follow-up of chronic heart failure patients this must be kept in mind and may be an alerting signal for worsening of EF.

AIM: Metabolic syndrome (MetS) is a cluster of established cardiovascular risk factors for diabetes mellitus and cardiovascular diseases. MetS has become a growing public health problem since 1/3 of adults in Turkey and in the world are under risk. We aimed to investigate the prevalence and awareness of MetS among the healthcare professionals working at first-step health centers in the Southeastern Anatolia Region in Turkey.

METHOD: The universe of the study included a total of 4,800 healthcare professionals working at first-step health centers in 8 provinces of the Southeastern Anatolia Region in Turkey and of these, the participants were sampled from each province. The participants were administered a data form including sociodemographic characteristics and items related to attitudes and awareness of MetS and the prevalence of MetS among healthworkers was assessed using IDF 2005 guidelines.

RESULTS: A total of 493 healthcare professionals participated in the study and 390 participants completed the survey. The prevalence of MetS was found 19.5%. The prevalence among physicians was 40% and this rate was statistically significant when compared to the rates for other professions(7.8). Of 493 participants, 385 (78.1%) were working at Family Health Centers and 108 (21.9%) at Public Health Centers. The participants included 304 (61.7%) women and 189 (38.3%) men. Mean age was 39.76 \pm 8.71 years for the participants with MetS and 33.21 \pm 7.71 years for the participants without MetS. MetS was present in 7.5% of women and 32% of men and in 20.4% of married participants and 7.1% of unmarried participants.

CONCLUSION: The regulations enacted by the Turkish Health Ministry regarding MetS, particularly the ones enacted as of 2010, have led to positive outcomes for the community. Nevertheless, healthcare professionals should be more sensitive about MetS both for themselves and for the other members of the community applying to them for healthcare service.

Control of the very older patient with High Blood Pressure

Pedro Alejandro Gonzales Flores, Pablo Rubinstein Aguñin, Monica Pons Querol, Silvia Sanchez Casco
Catalan Health Institute, CAP Les Fontetes, Cerdanyola del Vallès, Barcelona, Spain

OBJECTIVES

1. To determinate the degree of control in patients with High Blood Pressure (HBP) who had > 80 years old.
2. To determinate the kind of treatment for the patient very older
3. To determinate the comorbidities of the very older people with HBP

METODOLOGY

Descriptive an retrospective study of HBP patients of the CAP Fontetes (Cerdanyola del Vallès). We chosen 80% of all hypertensive patients. As good control was < 140/90 as indicated in the ICS guide and 150/90 (guide of the EHS). The main comorbidity was diabetes, the target injury organ: Microalbuminuria and hypertrophy of left ventricle and established CV disease: heart disease, kidney failure, stroke, and peripheral artery disease. The results were processed using the SPSS system version 4.0

RESULTS

Prevalence of hypertension was 46.3% (727 of 1570 people). We chosen 583 HBP patients (80.2%). 174 were older than 80 years (29.8%). The main treatments were: ARA II 96 diuretics (16.47%), ACE diuretic 93 (15.95%), ACEs 81 (13.89%), ARA II 46 (7.89%), Diuretics 34 (5.83%) and other 116 (19.90%). The degree of control following the guides of the ICS was 53.4% (93) and using the guide of the SEH 78.1% (136). Diabetes was present in 49 (30,6%). TIO: 9 Microalbuminuria (5.17%) and 5 left Ventricular hypertrophy (2.87%). Established CV disease: heart disease 32 (18.39%), Renal Failure chronic 31 (17.81%), AVC 17 (9.77%) and arterial disease 8 (4.59%)

CONCLUSIONS

1. Control of HBP in patients older than 80 was 53,4% vs 62,1% in younger than 80
- 2 Microalbuminuria was the main TIO and Cardiopathy was the main CVD. Diabetes was present in 30,6%
3. There are many different treatments for very elderly people.
3. The degree of control was 53,45% and 78.1% according to the guide used (ICS vs EHS) to having significant difference (p = 0.01)

Relationship between anxiety and depression with asthma control at urban setting of Kuala Lumpur

Dayangku Hayaty Awg Dzulkarnain¹, Mohazmi Mohamad²

¹Department of Family Medicine, Universiti Putra Malaysia, Serdang, Selangor, Malaysia

²Department of Family Medicine, University Malaya, Kuala Lumpur

INTRODUCTION: Asthma is a common medical condition in primary care.. Anxiety and depression are believed to have close association with poor asthma control. Historically, asthma has been considered a psychosomatic illness in which psychological factors play an important role in initiating and exacerbating symptoms of airway obstruction. The aim of this study was to determine association of anxiety and depression with poor asthma control at University Malaya Medical Centre.

METHODS: A cross- sectional study was carried out among 128 patients attending primary health care clinic and asthma clinic at University Malaya Medical Centre, Kuala Lumpur between April to June 2011. They were recruited via convenient sampling. The questionnaires that were used in this study consisted of four sets of self-administrated questionnaires (demography, asthma background, Asthma Control test (ACT) and Hospital Anxiety and Depression Scale (HADS). Analysis was performed using SPSS 18.0. This study is sub analysis from a study on "Prevalence of depression at urban setting of Kuala Lumpur"

RESULT: The overall response rate was 93.3% The mean age of respondents was 45.6±19 years, majority was Malay (57%), Female (71.9%), Married(63.3%), Monthly income <RM1500 (46.9%), Received secondary education(36.7%), Working (56.3%) and Non- smoker(89.1%).A univariate analysis had shown a significant association between depression with gender, income, occupation, education level and Asthma Controlled Test(ACT) whereby anxiety had shown a significant association with Asthma Controlled Test (ACT) only. The final fitted model of multiple logistic regressions found that none of the factors associated with depression had statistically significant but anxiety has remain statistically significant with Asthma Controlled Test (ACT).

CONCLUSION: There was no significant association between depressions with poor asthma control. This might be due to small sample size which is not big enough to show a significant association. Anxiety has a statistically significant association with poor asthma control.

Sharing our experience on a chronic heart failure programme carried out in a Primary Care Setting

Daniela Florentina Pruteanu, Noelia Pastor Gradoli

Quart de Poblet Health Care Centre

BACKGROUND AND AIM: to assess a programme of integrated care (primary - specialized care) in the patients with advanced chronic heart failure (ACHF) (NYHA III and IV) from our health care centre (HCC) in the period 2012-2014.

METHOD: The programme included all the patients with ACHF from our HCC and consisted in planned home visits performed by nurses and GPs, aiming to improve patient's management and to avoid acute events and unnecessary emergency calls and hospital admissions. Evaluated variables: gender, age, number of months within the programme, number of ER visits 1 year before and after the inclusion in the programme, number of hospital admissions 1 year before and after the inclusion, family support, associated diagnoses, place of death if appropriate, number of planned home visits, quality care standards (echocardiography study performed), use of home hospitalization unit (HHU).

RESULTS: N=58 patients; mean age: 85 years; 67.2% women; 76% NYHA III. Mean number of months in the programme 13.3. In most of the patients (86.2%) the main care giver was a family member. 22.4% used HHU services. 46.6% associated anxiety/depression. In 84.5% of the patients an echocardiography was performed via fast referral visit (collaboration with specialized care). Mean number of hospital admissions: 1.53 before inclusion; 0.83 after inclusion; Mean number of ER visits: 4.52 the year before inclusion and 2.02 after the inclusion. 58.6% died (out of which 53% of them at home). Mean number of monthly planned home visits was 1.16 for the nurses

and 1.6 for the GP.

CONCLUSIONS: Our programme achieved an important reduction of the ER visits and of hospitalizations, which means a better management of preventing acute events. There was a good collaboration between primary and specialized care (HHU, cardiologist). Good quality of care standards achieved. Patients' end of life in home environment in a large proportion.

OP-021

A double-blind randomized, placebo controlled trial of the effect of Vitamin D3 supplementation on long term glycemic control

Shaheen Chowdhury, Gift Norman, Carolin Elizabeth George

Bangalore Baptist Hospital, Bangalore

Introduction and justification:

Diabetes is responsible for a major share of the burden of chronic disease worldwide. It has been postulated that the islet cell reactivity and inflammation in T2DM is responsible for the progressive nature of the disease.. In this context, the role of Vitamin D is being explored in view of its modulation of inflammatory pathways which comprise key events in T2DM progression. In addition in the Indian context particularly, Vitamin D deficiency appears to be an endemic problem.

OBJECTIVES:

To study the effect of adding Vitamin D3 supplementation to the therapeutic regimen on the long term glycemic control in type 2 diabetes patients.

METHODS:

This randomized double-blind placebo controlled clinical trial was conducted with 85 type 2 diabetic participants. The vitamin D-group (n = 44) and the placebo group (n = 41) were matched for gender, age, sunlight exposure and HbA1c at the baseline. The vitamin D-group received 60,000 IU vitamin D3 once a month for 3 months whereas the placebo group (n = 42) received a matching placebo.

RESULTS:

One hundred and sixteen participants were randomly assigned into two groups. Post attrition 85 subjects (with no difference in baseline characteristics) were analysed. Mean Hb1Ac increased at the end of 3 months in the placebo group (p value - 0.021) whereas the Vitamin D group did not show a statistically significant increase (p value - 0.090)

CONCLUSION:

Three months of Vitamin D3 supplementation to T2DM patients appeared to arrest the progression of the natural course of disease.

Health care procedures involved in the cardiovascular diseases follow-up in general practice: data analysis from the ECOGEN study

Hélène Carrier, Ludovic Casanova, Pierre André Bonnet

Department of general practice, University of Aix-Marseille, Marseille, France

Background. The chronic follow-up of cardiovascular diseases is rarely studied in primary care.

The French classification of medical procedures of the Assurance Maladie can't describe the real nature of care procedures involved in general practice consultations. The objective of the ECOGEN national study was to describe the content of these consultations.

Aims. To describe the care procedures involved during cardiovascular diseases follow-up in general practice and to categorize these procedures.

Method. Multicenter, observational cross-sectional national study, conducted in 128 general practice offices.

Between December 2011 and April 2012, 54 investigating residents collected consultation data, using the International Classification of Primary Care (ICPC-2). Cardiovascular diseases were selected within the consultation results database. A descriptive analysis of care procedures was done.

Results. Cardiovascular diseases in general practice included in average 2.29 care procedures. The most frequent procedures were the drug treatment (82.85 % of cardiovascular consultation results), and the partial clinical examination (68.01 % of cardiovascular consultation results). Among all the involved procedures, 51.86 % were diagnostic procedures and 41.28 % were therapeutic procedures.

Conclusion. During the follow-up of cardiovascular diseases in general practice, several care procedures were performed or planned. Therapeutic and diagnostic procedures were the most frequent. Preventive process and coordination process were minor.

Hypoalbuminaemia and cancer diagnosis in primary care: a case-control study

Samuel William David Merriel¹, Fergus Hamilton¹, Deborah Sharp¹, Robert Carroll¹, Willie Hamilton²

¹Centre for Academic Primary Care, University of Bristol

²Medical School, University of Exeter

Background & Aims

Earlier cancer diagnosis improves treatment and survival rates. Hypoalbuminaemia (albumin <35g/L) is associated with poorer cancer prognosis and treatment outcomes in secondary/tertiary care patients. No studies have yet been performed exploring the relationship between low albumin and a new diagnosis of cancer.

The primary aim was to determine if adult patients with a new diagnosis of cancer in primary care have hypoalbuminaemia in the 12 months prior to diagnosis. A second aim was to explore whether hypoalbuminaemia is associated with a diagnosis of particular cancer types.

Methods

A case-control study of 243,730 adult patients in primary care was performed on data extracted from the DISCOVERY database. The main outcome measure was a diagnosis of cancer, including the type of cancer. Relevant past medical history of conditions affecting albumin levels (liver dysfunction, nephrotic syndrome, chest or abdominal trauma, sepsis or heart failure) and demographic data were also extracted.

Descriptive statistics, chi-square and t-tests, were used to summarise albumin levels and baseline characteristics of participants. Unadjusted and adjusted logistic regression analyses were performed. Positive predictive values (PPV) for cancer diagnoses were calculated.

Results

Patients with a diagnosis of cancer were similar in age and gender to those who did not have cancer. Mean albumin levels were significantly lower in patients with a cancer diagnosis compared to controls (39.89g/L vs 41.35g/L, $p < 0.0001$). The adjusted analysis showed patients with hypoalbuminaemia were more likely to be diagnosed with cancer within the next 12 months (OR 1.68 95% CI 1.58, 1.80). The PPV was 13.8% (95% CI 13.7%, 13.9%). Hypoalbuminaemia was associated with an increased risk of diagnosis of a number of different cancer types.

Conclusions

Hypoalbuminaemia is associated with an increased risk of subsequent cancer diagnosis. GPs should consider a possible diagnosis of cancer in their differential diagnosis for a low albumin.

OP-024

Proposal of a Primary Care follow-up protocol for management of patients with Stable Coronary Artery Disease diagnosis

Joana Ribeiro¹, Luis Santos², Tiago Adrega², Bruno Oliveira¹, Patrícia Morgado¹, José Santos²

¹Unidade de Cuidados de Saude Primarios Aveiro I, ACES Baixo Vouga

²Department of Cardiology, Centro Hospitalar do Baixo Vouga, Aveiro

BACKGROUND: Coronary Artery Disease (CAD) is a common condition in patients accompanied by Family Physicians (FP) and is the most important cause of morbidity and mortality in the world.

The observation of patients diagnosed with stable CAD is often performed in parallel between Primary and Secondary Health Care and many with hospital discharge after stabilization.

It is therefore essential that the FP is informed about the condition and accordingly prepared for appropriate clinical management of these patients. For these reasons, we propose a clinical protocol to improve clinical practice excellence in this setting, and adapted to the Primary Care reality.

AIM: I. Standardization of care in patients with stable CAD with up-to-date evidence; II. Decrease disease and economic burden; III. Foster collaboration between Primary and Secondary Care.

METHODS: We evaluated the international guidelines with more scientific impact and performed additional literature search on stable CAD. The information was organized and adapted in consonance with Primary Care challenges. The project was carried out with the help of Cardiology and FP experts. Finally, it has been proposed for presentation to FP of the hospital referral area.

RESULTS: an integrator document was conceived, directed to FP, proposing decision-making flow charts designed to guide the clinical judgment, and consists of seven main points: I. Patient information and education and emphasis of therapeutic compliance; II. Clinical monitoring (symptoms, physical examination, drug's iatrogenesis, concomitant diseases); III. Lifestyle modification and control of risk factors; IV. Control of comorbidities (namely vaccination); V. Pharmacological management (ischemia and event prevention); VI. Analytical, electrocardiographic and stress testing management; VII. Red flags for hospital referral.

CONCLUSION: The existence of protocols adapted to the reality of Primary Care underpin a valuable resource to optimize medical performance and ensure excellence of care for patients with stable CAD.

Keywords: Stable Coronary Artery Disease; Primary Care; protocol; clinical management; follow-up; guidelines.

OP-025

An Evidence-Based 'Screening' Toolkit for Mental Health Disorders in Seniors

Bonnie M Dobbs¹, Diane C Mcneil², Anita S Saini², David G Moores¹

¹Dept. Family Medicine, University of Alberta

²Promotion, Prevention & Community Initiatives, Provincial Addiction and Mental Health, Alberta Health Services

BACKGROUND: Mental health disorders in seniors often go undetected. In answer to repeated calls to improve the detection of mental health disorders we have developed a Toolkit for the early identification of the four most common mental disorders (anxiety, dementia, depression, and substance [alcohol] misuse).

AIM: To create a standardized, user-friendly Toolkit to assist health care professionals in the primary care setting in the early identification of anxiety disorders, dementia, depression, and alcohol misuse in seniors.

METHOD: A series of systematic literature reviews were conducted, for each of four mental health disorders. The reviews focused on extracting data relevant to the accuracy of the tools for identifying the mental health disorders in the primary care setting (e.g., psychometric properties of sensitivity, specificity, etc.) compared to a gold standard (e.g., DSM-IV-TR, ICD, etc.). Tools with the best psychometric properties for identification were selected. An independent expert panel provided validation for the tools selected. Consensus group conferences were held with primary care health care professionals to obtain feedback on the ease of administration, scoring, and patient uptake.

RESULTS: Eight tools were identified: one for anxiety, two for dementia, three for depression, and two for substance (alcohol) misuse. All tools met a number of criteria including a high degree of accuracy in identifying those with and without the disorder, ease of administration (e.g., short, easy to score), and being non-proprietary. Both a paper and web-based version of the Toolkit were developed, with both versions available at no cost to health care professionals.

CONCLUSION: The availability of an evidence-based Toolkit to assist health care professionals in the primary care setting for the early identification of seniors with anxiety, dementia, depression, and/or an alcohol misuse problem represents a significant step in earlier detection of these disorders with anticipated improvements in outcomes in the senior population.

Keywords: senior's mental health, primary care, toolkit

HIV indicator condition-guided testing to reduce the number of undiagnosed patients and prevent late presentation

Ivo Joore¹, Derk Arts¹, Marjan Kruijer¹, Eric Moll Van Charante¹, Suzanne Geerlings², Jan Prins², Jan Van Bergen¹

¹Department of General Practice, Academic Medical Center, University of Amsterdam, Amsterdam, Netherlands

²Division of Internal Medicine, Department of Infectious Diseases, Academic Medical Center, University of Amsterdam, Amsterdam, Netherlands

Background and Aim Recent guidelines advocate accelerated provider-initiated HIV testing by general practitioners (GPs). The European Centre for Disease Prevention and Control recommends offering an HIV test to individuals who display HIV related diseases. The National Institute of Health and Care Excellence guideline recommends performing 'routine HIV testing' among all 15- to 59-year-olds where HIV prevalence exceeds 2 in 1000. We aimed to identify the number of patient consultations in six general practices in the south-east of Amsterdam, and the incidence of HIV indicator conditions reported in their medical files prior to diagnosis. **Method** A cross-sectional search in an electronic general practice database. We used a case-control design to identify those conditions most associated with an HIV positive status.

Results We included 102 HIV cases diagnosed from 2002 to 2012, and matched them with 299 controls. In the year prior to HIV diagnosis, 61.8% of cases visited their GP at least once, compared to 38.8% of controls. In the five years prior to HIV diagnosis, 58.8% of HIV cases had exhibited an HIV indicator condition, compared to 7.4% of controls. The most common HIV-related conditions were syphilis and gonorrhoea. The most common HIV-related symptoms were weight loss, lymphadenopathy and peripheral neuropathy. During this period, average HIV prevalence among 15 to 59-year-olds increased from 0.4% to 0.9%.

Conclusions This study revealed many opportunities for HIV indicator condition-guided testing in primary care. As yet, however, HIV indicator conditions are not exploited as triggers for early HIV testing. In April 2015, a comparable study will be performed in a larger primary care database that is representative for the Dutch general population.

Proposal of a Primary Care follow-up protocol for management of patients with Atrial Fibrillation diagnosis

Joana Ribeiro¹, Luís Santos², Tiago Adrega², Patrícia Morgado¹, Sofia Madanelo³, José António Santos²

¹Unidade de Cuidados de Saúde Primários Aveiro I, ACES Baixo Vouga

²Department of cardiology, Centro Hospitalar Baixo Vouga, Aveiro

³Unidade de Saúde Familiar Santa Joana, ACES Baixo Vouga

BACKGROUND: Atrial Fibrillation (AF) is a common condition in patients accompanied by Family Physicians (FP) and is a paramount cause of morbidity and mortality.

The observation of patients diagnosed with AF is often performed in parallel between Primary and Secondary Health Care and many with hospital discharge after stabilization.

It is therefore essential that the FP is informed about the condition and accordingly prepared for appropriate clinical management of these patients. For these reasons, we propose a clinical protocol to improve clinical practice excellence in this setting, and adapted to the Primary Care reality.

AIM: I. Standardization of care in patients with AF with up-to-date evidence; II. Decrease the disease burden; III. Foster collaboration between Primary and Secondary Care.

METHODS: We evaluated the international guidelines with more scientific impact and performed additional literature search on AF. The information was organized and adapted in consonance with Primary Care challenges. The project was carried out with the help of Cardiology and FP experts. Finally, it has been proposed for presentation to FP of the hospital referral area.

RESULTS: an integrator document was conceived, directed to FP, proposing decision-making flow charts designed to guide the clinical judgment, and consists of five main points: I. Patient information and education and emphasis of therapeutic compliance; II. Clinical monitoring (symptoms, drug's iatrogenesis, concomitant diseases); III. Anticoagulant therapy (CHA₂DS₂-VASc, HAS-BLED, drug selection); IV. Rate and rhythm management; V. Red flags for hospital referral.

CONCLUSION: The existence of protocols adapted to the reality of Primary Care underpin a valuable resource to optimize medical performance and ensure excellence of care for patients with AF.

A Study of Reliability and Validity For the Turkish Version of Dizziness Handicap

Metin Canbal¹, Gülsüm Duyan², Sevsen Cebeci¹, Hanefi Kurtaran³, Ismail Arslan⁴

¹Department of Family Medicine, Turgut Ozal University, Ankara, Turkey

²Department of Social Services, Turgut Ozal University, Ankara, Turkey

³Department of Otolaryngology Head and Neck Surgery, Turgut Ozal University, Ankara, Turkey

⁴Department of Family Medicine, Ankara Education and Research Hospital, Ankara, Turkey

OBJECTIVE: Dizziness is one of the most frequently seen unresolved diseases in primary health care. Regardless of its reason or characteristics; effects of dizziness in patients' daily life are very significant. This study is planned to adapt the Dizziness Handicap Inventory to Turkish and to use it in practice; an inventory which can be used to determine the alterations in the life qualities of the outpatients or inpatients consulted with the dizziness complaint.

METHOD: 178 patients were included in the study, who was admitted to Turgut Ozal University Medical Faculty Otorhinolaryngology and Family Physician polyclinics with dizziness complaint for last 1 month. Half Configurative Interview Form and Dizziness Disability Inventory (BEO) were used as data collection means.

RESULTS: BEO; consists of 25 clauses which determine the aggravating factors associated with dizziness and shakiness and also the emotional and functional results of vestibular system diseases. Inventory consists of 3 sub-inventories, intended to determine physical, emotional and functional effects of the vestibular system diseases. All of the sub-inventories have high inner-confidence and their Cronbach Alfa values are between.67 and.82. Also the Cronbach Alfa values of the sub-inventory groups were similar with the general inventory.

CONCLUSION: The findings obtained from the study show that; this inventory can be used on dizziness patients in our country, and it has satisfactory validity and reliability coefficients. We think that, by using this inventory, dizziness complaint and its effects on life quality can be monitored with more objective criteria.

Keywords: dizziness, life quality, inventory

⁶Perak Health Department, Ministry of Health, Malaysia

⁷Melaka Health Department, Ministry of Health, Malaysia

⁸Department of Family Medicine, School of Medicine and health Sciences, Universiti Sains Malaysia, Kelantan, Malaysia

Background and Aim

The global burden of cardiovascular disease (CVD) remains critically high. Approaches to target those at highest risk have been recommended. Yet, both patients and doctors have been found to be poor in estimating cardiovascular (CV) risk. This study aimed to determine if patients attending primary care could accurately estimate their CV risk.

Methods

This is a cross sectional study conducted in nine primary care clinics chosen conveniently from five regions in Malaysia in 2014. All patients aged 35 years and above who had CV risk assessment performed in the past year were invited to participate. Those with known CVD were excluded. A face-to-face interview was conducted using structured questionnaire to collect data on patients' sociodemography, blood pressure, lipid profile, smoking status and their perception of their individual CV risk. The 2008 Framingham risk score was used to calculate the actual 10-year CVD risk, which was classified into low (<10%), moderate (10-20%) and high (>20%) risk.

Result

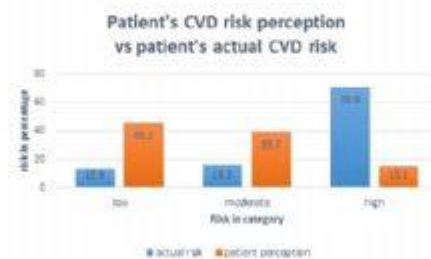

We recruited 1094 participants. Mean age was 57.2 years (SD 9.8). There were 37.4% males and 60.9% had diabetes. There were 776 participants in the high risk group. Of these, only 112 (10.2%) perceived themselves as being at high risk. The remaining 664(60.9%) underestimated their risk. Factors associated with underestimation of risk were being natives (AOR: 6.413, CI: 3.513, 11.703), foreigners (AOR: 7.348, CI: 2.499, 21.602), having a family history of CVD (AOR: 2.596; CI: 1.492, 4.516) and those with higher BMI (AOR:1.050; CI:1.005,1.098).

Conclusion

An alarmingly high number of patients attending primary care clinic underestimate their CV risk. This mismatch between perceived and actual risk indicates over optimism and may lead to poor compliance to treatment and lifestyle changes.

Keywords: Cardiovascular risk, estimation, primary care.

Cognitive Impairment in Post Ischemic Stroke

Hardisman Dasman, Akmal Irsyadi Iswan, Syarif Indra

Faculty of Medicine, Andalas University, West Sumatera, Indonesia

BACKGROUND: Cerebrovascular accident or stroke is one of the global health problems. The awareness on stroke increases because the problem often appears as a result of other degenerative diseases which have high prevalence. In Indonesia especially, the prevalence of stroke is considerably high, which is 12.1 per-1000 inhabitants. Moreover, if stroke patients survives, especially in ischemic stroke; they often have both physical and cognitive impairment. Despite the prevalence of stroke in Indonesia is high, there is lack of information about post stroke cognitive impairment. This study was conducted to measure the incident of post stroke cognitive impairment and explore its contributing factors.

METHOD: Cross sectional study design was conducted in two hospitals in West Sumatera Province: Djamil Hospital (public) and Ibnu Sina Hospital (private). We examined 81 post ischemic stroke patients with onset >3 months at neurology polyclinic. We recorded patients' demographic data, blood pressure, lipid level, history of diabetes and smoking. We used MoCA-Ira (Montreal Cognitive Assessment Indonesian-version) for assessing cognitive impairment.

RESULT: The age average of patients is 59 years (SD+8.7, min-max:50-83) and the average score of MoCA-Ira is 21 (SD+4.2). Based on MoCA-Ira score, the incidence of post stroke cognitive impairment is 63%. There is significant different of cognitive impairment between low and high education level of patients ($p<0.05$) and age below and over 60 years old ($p<0.05$). There are high proportion of cognitive impairment in patients with history of smoking, diabetes mellitus, hypertension and dislipidemia; however there is no significant correlation ($p>0.05$). Also, there are no difference of cognitive impairment incidence between male and female patients ($p>0.05$).

CONCLUSION: The incidence of cognitive impairment in post ischemic stroke is considerably high. Age and education which is related to degenerative process and activity of the brain affect on the possibility of the impairment.

Keywords: cognitive impairment; post-ischemic stroke

¹Department of Family Medicine, Acıbadem University School of Medicine, Istanbul, Turkey

²Department of Family Medicine, Kartal Lütfi Kırdar State Hospital, Istanbul, Turkey

³Esenyalı Family Health Center, Pendik, Istanbul, Turkey

⁴Gazi Mahallesi Family Health Center, Sultanbeyli, Istanbul, Turkey

⁵Recep Sağlık Family Health Center, Gaziosmanpaşa, Istanbul, Turkey

⁶Ümraniye Merkez Family Health Center, Ümraniye, Istanbul, Turkey

⁷Kadıköy 3 Nolu Family Health Center, Suadiye, Istanbul, Turkey

Introduction/AIM: Vascular disease risk can go unidentified for long in undifferentiated, asymptomatic individuals in the general population, accounting for missed preventive care opportunities and high cerebro-and cardiovascular disease (CVD) burden. Little is known about levels of inter-arm blood pressure in the general population, as well as, its association with cardiovascular -cardiometabolic risk and disease cluster. The aim is to assess the level of systolic inter-arm blood pressure difference (SIAD) in adults stratified by age and gender (primary outcome) and to investigate whether there is a threshold value for SIAD associated with an increase in vascular-metabolic disease frequency (secondary outcome).

METHODS: This cross-sectional, descriptive study will be conducted in a population-based sample, representative

of the adult population of two districts in Istanbul (Gaziosmanpaşa and Ümraniye) stratified by age and gender (calculated with single sample size formula with a significance threshold of <0.05 , a power of 80% and a 95% CI). Randomly selected individuals (18-60 years) from the population registries of family doctors will be invited to the family health centers for screening. Consenting individuals fulfilling inclusion criteria (no aortic coarctation or aneurysma verified by eHR) -after assessment of sociodemographic and health-related information- will undergo 2 consecutive blood pressure measurement on both arms with a calibrated two-arm Riester Sphygmomanometer device according to JNC7 standards. Participants grouped according to $SIAD \geq 20$ mmHg and diastolic $IAD \geq 10$ mmHg as elevated vascular-metabolic risk (primary outcome parameter) will be compared to their counterparts with IAD below the threshold values for related vascular-metabolic health risks (secondary outcome). Results preliminary results will be presented during the conference.

Keywords: cardio-metabolic risk, inter-arm blood pressure, threshold

OP-032

Application of the STOPP/START Criteria to a group of Complex Chronic patients in Primary Care

Jose Pascual Tormo¹, Juan Carlos Salazar¹, Fernando Javier Elias¹, Juan Ignacio Saenz¹, James Diego Ettinghausen¹, Cruz Villar¹, Inma Sanchez²

¹Palafrugell Primary Care Center. Palafrugell, Girona. Spain

²Research Department. Hospital of Palamos. Palamos, Girona. Spain

BACKGROUND & AIM

The objectives were: a. To determine the percentage of chronic complex patients with at least one inappropriate prescription according to the STOPP/START (S/S) criteria. b. To readjust the medication in a cases group and compare results with a control group during one year. c. Measure the adherence of patients to the changes applied.

DESIGN: Longitudinal, prospective, cohorts comparative study. One Primary Care Center. Period: 2013-2014. Selection: both genders, age 65 and older, labeled chronic complex patients. Randomized in cases and control groups in a 1:2 ratio. Variables: Age, sex, group, number of applicable criteria, changeable criteria, modified criteria and maintained criteria at the end of the study. Statistical analysis: univariate descriptive for categorical and continuous variables and bi-variate for means comparison. CI: 95%

RESULTS: Target population: 1332 people. People included in study: 153. Cases: 51. Controls: 102. Cases and controls with at least one S/S criteria: 78%. Number of readjustments made: 39. Changes maintained at the end of the study: 86%. Cases with at least one criteria at the end of the study: 58%. Controls with at least one criteria at the end of the study: 81%.

CONCLUSION: We found a high percentage of patients with inappropriate prescription of chronic medication (78%) according to S/S criteria. There was a significant difference between application of these criteria and the usual clinical practice reflected by a decrease of the percentage of patients with S/S criteria in the cases group (78 to 58%) after a year while a similar percentage in the control group (78 to 81%). We observed good adherence to the recommendations with 86% of the changes maintained after a year.

Coronary Artery Patients' Perceptions about Their Health and Disease

Buket Eylem Doğan¹, Dilsad Save²

¹Siyami Ersek Thoracic and Cardiovascular Surgery Training and Research Hospital, İstanbul

²Marmara University, School of Medicine, Department of Public Health

Background & Aim

Coroner artery disease is the first cause of mortality and morbidity in the World. Community awareness and public knowledge about he disease is essential components in control of the disease and treatment benefits. This qualitative study aimed to explore and understand coronary artery disease patients' perceptions about their disease and needs and also experiences about health services, health seeking behavior and issues about their satisfaction with health service.

Method

The study was carried out with participation of randomly assigned 52 patients aged 40-65 who were being treated in coronary artery disease units in a thoracic and cardiovascular surgery training and research hospital in İstanbul. A qualitative data collection method indepth interview was conducted in 30-45 minutes and all of them tape recorded. Before the interview data was gathered about patient's demographic and social characteristics, risk factors, disease status and taking medicines with short questionnaire.

Results

The interviews with participant indicated that there was lack of information about cardiac disease and preventive measures against this disease. Patients stated that they needed more explanation about their disease and ongoing treatment procedures. The most important issues about patient satisfaction were expressed as patient intensity, communication problems with health personel, difficulty about legal procedures in prescription, to be followed by different physicians and lack of confidence about diagnosis and treatment procedures. Patients complain about patient intensity in outpatient services, burden of long waiting times and short duration of examination. They told that the physician only gives medicines, neither talk with themselves nor examine carefully. Patients also told that they wanted to be examined by the same physician, and found boring to give same knowledge to different doctors. Most of the patients regarded themselves as " half-man/women" after heart attack even they have passed succesfull operation.

CONCLUSION:

Raising knowledge and awareness for cardiovascular disease in public is needed.

Keywords: qualitative study, indepth interview, patient perception, cardiovascular disease

OP-034

Blood pressure values are not compatible with medication adherence in hypertensive patients

Aysegul Uludag, Erkan Melih Sahin, Hasret Agaoglu, Selen Gungor, Yusuf Haydar Ertekin, Murat Tekin
Department of Family Medicine, Canakkale Onsekiz Mart University, Canakkale, Turkey

In management of hypertension maintaining the medication adherence with treatment is as important as starting treatment. Studies have shown that the majority of patients taking medication do not reach their target values. This study aimed to investigate the relationship between the patient medication adherence and blood pressure values and reflection to general well-being.

METHOD:

The study included 259 primary hypertension patients applying to the outpatient clinic. The patients with blood pressure measurements completed the medication adherence self-efficacy scale-short form 13 and the WHO-5 Well-Being Index. A Holter device was attached and 24-hour blood pressure monitoring was completed.

RESULTS: The mean points for medication adherence scale was 28.2 ± 9.3 [0-39] and mean WHO-5 points were 13.7 ± 4.6 [4-25] for patients. Clinical mean systolic blood pressure was 140.0 ± 12.6 and diastolic 84.8 ± 9.0 mm Hg, while 24 hour mean blood pressure was systolic 119.5 ± 10.6 and diastolic 73.3 ± 8.1 mm Hg. While there was a negative correlation between medication adherence scale scores and clinical systolic blood pressure ($r = -0.171$; $p = 0.006$), there was no correlation with other blood pressure readings. There was no correlation with WHO-5 score and clinical readings, though there was a positive correlation between ambulatory mean systolic and diastolic blood pressure ($r = 0.141$; $p = 0.023$ and $r = 0.123$; $p = 0.049$, respectively). There was a positive correlation between the patients medication adherence scores and WHO-5 scores ($r = 0.141$; $p = 0.023$).

CONCLUSION:

It was observed that the scales used in the study did not add benefit to hypertension monitoring. When clinicians assess medication adherence of patients they should benefit from objective blood pressure measurements and not scales.

Eye Health – A Priority for GP's

Waqar Shah¹, Annette Dinnall²

¹Royal College of General Practitioners

²UK Vision Strategy

Introduction

Sight loss is common among older people and can affect their general health and wellbeing. The Royal College of General Practitioners (RCGP) have selected eye health, with a focus on ageing and sight loss, as a clinical priority.

Dr Waqar Shah, RCGP Clinical Champion for Eye Health, is working with the RCGP and UK Vision Strategy team to deliver this priority by driving a programme of work to improve GP confidence in diagnosing eye conditions earlier and to support patients with sight loss.

Method

A survey was sent to 50,000 members of the RCGP to establish levels of awareness of GPs and primary healthcare teams around managing the eye health of their patients and the needs of their patients with sight loss.

Results revealed that many GPs in the UK were not confident in detecting early signs of major eye diseases and welcomed further training and support.

Results

Sight loss in Older People the essential guide for general practice was created to help GP's and practice staff

increase their knowledge and awareness of the particular sight issues facing older people, reduce preventable sight loss amongst ageing patients and provide more effective management of eye conditions. The guide has been accredited by the RCGP and sent to every UK GP practice.

An online survey conducted in January 2015 to gather GP practice staff feedback on the guide showed that:

- 78 % either 'strongly agreed' or 'agreed' that the guide improved their knowledge of sight loss in older people
- 65% stated the guide would have a 'major' or 'moderate' level of impact on the care they provide to patients with sight loss

Conclusion

The guide was found to be very useful to GPs and will be promoted and disseminated at key GP and primary care conferences across the UK.

Keywords: eye health, GP's, sight loss

OP-036

Quality of life in patients with primary knee osteoarthritis

Taher E. Abd Elstaar¹, Aml Ahmed Salama², Heba Gamal Esaily³, Samer Ali Bolty⁴

¹Prof. of Orthopedics, Department of Orthopedics, Faculty of Medicine, Menoufia University, Menoufia, Egypt.

²Lecturer of Family Medicine, Department of Family Medicine, Faculty of Medicine, Menoufia University, Menoufia, Egypt

³Lecturer of Physical Medicine and Rehabilitation, Department of Physical Medicine and Rehabilitation, Faculty of Medicine, Menoufia University, Menoufia, Egypt.

⁴Resident of Family medicine, Faculty of Medicine, Menoufia University, Menoufia, Egypt.

OBJECTIVES:

To assess the quality of life in patients with primary knee osteoarthritis

BACKGROUND:

Osteoarthritis (OA) is the most common degenerative joint disorder and a major public health problem throughout the world. OA of the knee is a major cause of mobility impairment, which has an unpredictable and negative impact on health and quality of life.

Subject and METHODS:

A cross sectional analytical study involving (116) patients with primary knee osteoarthritis, who were admitted to outpatient clinic of rheumatology and orthopedic in Menoufia university hospital during the period of the study. Patients were included if they had radiographic evidence of hip or knee OA. Quality of life (QoL) in those patients was assessed through The OAKHQOL questionnaire contains 43 items and describes QoL in five domains: physical activities (16 items), mental health (13 items), pain (4 items), social support (4 items), social functioning (3 items); and 3 independent items. Each item is scored on a scale from 0 to 10.

RESULTS:

This cross sectional study was conducted on 116 of patients with primary knee osteoarthritis, (74.1%), of them were females and (25.9%) of them were males. The mean of age of the studied population was 51.37±8.85.

As regarding KHOAQOL score, a statistical significant correlation was reported with duration of the disease. Age, sex, BMI, Site of OA and use of drug regularly constituted no statistical significant difference in their KHOAQOL score.

The study shows significant positive correlation of BMI of patients and their physical activity parameter of KHOAQOL.

CONCLUSION:

The perception of quality of life is negatively affected by the duration of the disease, while age, sex, site if disease unilateral or bilateral and socioeconomic stander constituted no significant correlation. The study reported also that performing daily physical activity is affected by BMI of the patient.

Keywords: Quality, Primary, knee, Osteoarthritis.

Hypocortisolism is frequently overlooked and misdiagnosed as psychiatric or other disorders

Sergey Surkov¹, Sergey Surkov², Iballa Castro¹

¹Institut Català de la Salut, ABS Camps Blancs, Sant Boi de Llobregat (Barcelona), SPAIN

²Optima Salud, Barcelona, SPAIN

Hormonal disbalances are presented in many patients of all ages but widely overlooked if presented initially as psychic complaints. Patients with a variety of psychiatric disorders including addictions were found to have signs and symptoms of mild to moderate hypocortisolism that seems to be commonly misdiagnosed clinical condition if we make a review of the literature.

Cortisol plays a key role in physical and mental well-being and serves as the barometer of the hypothalamic-pituitary-adrenal axis (HPA), which regulates and controls responses to stress. Modern way of life continuously maintains all of us under stressful situations so many family doctors should managed with considerable pool of patients with depressions, posttraumatic stress disorder (PTSD), addictions, all are conditions with evidence of HPA dysregulation.

Low cortisol may be one of several maintaining factors in the illness but once hypocortisolism has developed it may itself lead to all that symptoms of PTSD or depression and represent an important maintaining factor in illness chronicity.

Patients with mild to moderate cortisol insufficiency are for the most part relegated to receiving a psychiatric diagnosis when, in fact, the hormonal disorder is represented. Many emotional symptoms of hypocortisolism are tagged as psychiatric disorders.

When the presented primary symptoms fit the diagnosis of depression doctors are urged to treat these patients with antidepressants and if patients responds to that treatment it reduces even more chances to diagnose an underlying hormonal disbalances that can be treated.

There are strong suggestions that hypocortisolism may be of clinical relevance and an appropriate comprehensive examination should be made in order to correctly diagnose it specially in cases of psychiatric disorders.

By correcting underlying cortisol or other hormonal impairments, many patients improved, with some patients having a total reversal of psychiatric symptoms.

It's reasonable to evaluate and treat hormonal insufficiencies prior to psychotropic medication.

OP-038

Detection of psychosocial problems by practice nurses in routine diabetes consultations: are patients ready?

Anneke Van Dijk, Loes Van Bokhoven, Job Metsemakers, Trudy Van Der Weijden, Jacques Van Eijk
Maastricht University, CAPHRI School for Public Health and Primary Care

Background and aim.

Because of a high prevalence of depression in diabetes patients and its adverse impact on complications, screening for depression is recommended in routine diabetes care. For the implementation of psychosocial self-management support in diabetes care, practice nurses were trained to identify patients with psychosocial problems. The detection rates appeared to be strikingly low. Therefore, we examined patients' readiness to discuss psychosocial problems with practice nurses during diabetes consultations in Dutch family medicine.

Method.

A mixed methods design was used within an experimental study evaluating a psychosocial self-management approach integrated in routine diabetes care. In-depth interviews were conducted with type 2 diabetes patients (n=12) with psychosocial problems. Based on a qualitative content analysis of patients' current experiences and perspectives on integrated care, a structured questionnaire was designed to further explore the findings among a larger group of patients (n=205). The questionnaire included 14 items measuring patients' agreement with statements about diabetes care and the role of the practice nurse therein.

Results.

The qualitative part of the study showed that patients viewed a diabetes consultation primarily as a biomedical check-up. They did not perceive discussion of psychosocial well-being as an integral part of diabetes management. The quantitative part showed that younger patients were more open to discussing psychosocial problems with the practice nurse than patients over 65. Patients' openness to discussing psychosocial problems was not significantly associated with the practice nurses being trained in the psychosocial self-management approach.

Conclusions.

Patients see practice nurses primarily as specialists regarding the biomedical management of diabetes. Although patients seemed to support the ideal of integrated care, they did not expect a discussion about psychosocial problems in diabetes consultations. The incorporation of systematic detection of psychosocial problems in diabetes care requires endeavours to make patients acquainted with the new role of the practice nurse.

Is computer-mediated family medicine a feasible project? Theoretical, methodological and practical dimensions

Pnina Besserglik¹, Izhak Gilat², Irit Kuppferberg²

¹Tel Aviv university

²Levinski College research departement

Current studies and surveys show that the feasibility of computer-mediated (CM) medical services has to be examined closely from medical, organizational, economic, and ethical points of view. Supported by a grant given by the Israeli Organization of Family Doctors, the current qualitative and quantitative study aimed at exploring the characteristics of CM doctor-patient encounters from the participants' perspectives. The qualitative stage was guided by the principles of data and method triangulation. Data collection comprised CM naturally-occurring doctor-patient encounters and doctors' and patients' personal stories focusing on meaningful stories related to the research aim. Following the qualitative stage, a quantitative questionnaire was administered to patients. The results show that patients' were satisfied with the choice of the CM channel. In the paper, we will highlight the theoretical, methodological and practical aspects of the study. Specifically, we will present and interpret the main findings of the qualitative and quantitative stages and focus on the advantages of CM family-medicine (e.g. documentation, time saving, anonymity and convenience) and its limitations (e.g. lack of physical examination and personal touch).

OP-040

Perceptions of self-management in primary care: a cross-sectional survey study

Irene Bos Touwen¹, Jaap Trappenburg¹, Elke Tijhuis¹, Marieke Schuurmans¹, Niek De Wit²

¹Department of Rehabilitation, Nursing Science & Sports, University Medical Center Utrecht, The Netherlands

²Julius center for health sciences and primary care, University Medical Center Utrecht, The Netherlands

Background & aim

Chronic care and self-management support is increasingly provided in primary care settings. Primary care physicians and nurses have their own perceptions of self-management support and which patient will be successful in performing self-management. These perceptions will guide their decisions regarding the extent to which a patient is exposed to self-management. This study aims at increasing our understanding of the perceptions of general practitioners and practice nurses on providing self-management support. Furthermore, this study aims to identify patient-related factors that influence the success of self-management support as perceived by general practitioners and nurses.

Method

Between February and June 2014, a descriptive cross sectional survey was conducted in general practitioners and nurses working in primary care in the Netherlands. Data was collected through a self-administered online questionnaire.

Results

In total, 272 respondents completed the questionnaire (114 general practitioners and 158 nurses). The majority of care providers see their role in self-management support as coaching the patient. Most providers aim to give the patient responsibility for their health behavior and treatment. The three most frequently mentioned self-management activities were increase understanding of disease, establish common goals for treatment, and help patients take ownership in disease management. The perceived most important patient-related factors for successful self-management support were motivation (93.2%), knowledge of disease (82.6%), education level (80.4%), self-efficacy (77.2%) and patient-provider relationship (60.3%).

Conclusion

This study provides new insights in perceptions of primary care providers of self-management support in current practice and key patient-related factors influencing success of self-management support. Knowledge of providers' perceptions regarding self-management support can improve and support the implementation of self-management. Knowledge of patient-related factors that are perceived as facilitators or barriers for self-management provides insight in factors that influence care providers to support self-management to individuals.

Effects of blood glucose regulation and comorbidity on quality of life in type 2 diabetic patients – A preliminary multicenter study

Bilge Sönmez¹, Burcu Kayhan Tetik², Engin Burak Selçuk², Feyza Bezirgan Sarıgüzel³, Ismail Hamdi Kara³, Ergün Öksüz⁴

¹Çerkeş State Hospital Family Medicine, Çankırı, Turkey

²Inonu University Department of Family Medicine, Department of family medicine, Malatya, Turkey

³Düzce University Department of Family Medicine, Department of family medicine, Düzce, Turkey

⁴Başkent University, Faculty of medicine, Department of family medicine, Ankara, Turkey

INTRODUCTION:

Diabetes Mellitus (DM) is a major health problem with increasing incidence, serious complications and impair the patient's quality of life (QOL). Aim of our study is considering effects of blood glucose regulation or comorbid conditions on QOL and diabetes specific QOL.(DQOL)

Material – METHOD:

Our study is planned cross-sectional in four provinces; Ankara, Malatya, Diyarbakir ve Duzce. Participants diagnosed with type 2 diabetes (T2DM) according to ADA criteria and who gave patient acceptance answered sociodemographic questionnaire, EQ-5D scale for general QOL and DQOL. Our study will be carried out in a total of 700 patients in four provinces, currently completed in Ankara and Duzce and we present preliminary study results.

RESULTS:

Mean age of 260 patients was 56.2 in Ankara and in Duzce mean age of 99 patients was 57.4 ± 8.2. Demographic data of the participants are presented in Table 1.

Average of HbA1c levels was found 8.0% (min = 4.2% - max = 15.6%, SD = 1.9). For 359 patients with EQ-5D scale was determined 25 different health status. Visual Analog Scale scores were negatively correlated with HbA1c levels ($r = -0.124$, $P = 0.018$). When DQOL subgroups compared according to HbA1c levels; DQOLA, DQOLB, DQOLC and DQOLD scores in the group with lower HbA1c (<6,5%) were 36.9, 36.5, 18.2 ve 3.4, respectively and same scores in the group with HbA1C over 6,5% were 36.2, 40.2, 15.1 ve 2.7, respectively ($p < 0,005$).

CONCLUSION:

T2DM is a disease that can deteriorate self-care and decreases quality of life. In management of chronic diseases, holistic and comprehensive approach of family physician can provide good patient compliance and this attitude promises improvement in quality of life.

Relationship Between Obesity and Thyroid Functions in Adults

Ferhat Ekinci¹, Demet Merder Coşkun², Özgür Çağaç³, Hüseyin Yıldız⁴, Halis Yılmaz⁵, Arzu Uzuner⁶

¹Public Health Directory, Van, Turkey

²Haydarpasa Numune Education and Training Hospital Family Medicine Clinic, Istanbul, Turkey

³Salihli State Hospital Cardiology Clinic, Manisa, Turkey

⁴Malatya State Hospital Internal Medicine Clinic, Malatya, Turkey

⁵Sırnak Guclukonak State Hospital Family Medicine Clinic, Sırnak, Turkey

⁶Marmara University Medical School, Department of Family Medicine, Istanbul, Turkey

AIM: Obesity affects prognosis of many comorbid diseases negatively. The aim of this study was to investigate the relationship between obesity and thyroid functions.

METHOD: This observational descriptive study was conducted in outpatient clinics of a tertiary hospital in Istanbul, between 2011-2012. Consecutively selected 650 adults 19-65 years of age were recruited in the study. Thirty two patients who had previously thyroid disease were excluded from the study. Epidemiologic data have been collected by a questionnaire. Height and weight were measured, BMI was calculated and a blood test including thyroid function tests and lipid profile was performed. Participants were divided into three groups according to their BMI as normal weight (<20), overweight (20-24) and obese (≥25). Data was compared between the groups.

RESULTS: Data of 618 participants (53% female/47% male) was analyzed in this study. Mean age value was 43±15. There were 175 (28.3%) participants in normal weight, 242 (39.2%) in overweight and 201 (32.5%) in obese group. There was no statistically difference in terms of thyroid function levels, but there was a difference in terms of lipid profiles between groups. Atherogenic lipid levels (T.cholesterol, LDL and triglyceride) were higher and HLD levels were lower in overweight and obese group comparing with the normal weight group (p<0.05) but there were no statistically difference between overweight and obese groups (p>0.05).

CONCLUSION: This study is one of the few studies in the literature showing that there is no relationship between

obesity and thyroid function tests. On the other hand this study supports the common finding in the literature which is atherogenic lipid levels are higher in overweight and obese groups comparing with normal weight group.

Assessment of Vitamin D and Bone Mass Density Relation Among Adults Attending a University Hospital

Gökhan Eminsoy, Ali Ümit Geçkil, Altuğ Kut

Department of Family Medicine, Baskent University, Ankara, Turkey

Background & AIM: Vitamin D is an important component of bone metabolism. Mineralization of bones can be demonstrated using bone mass density (BMD) measurement. We aimed to show the relation of Vitamin D and BMD among adults attending a university hospital.

METHOD: The research is planned as a retrospective cohort study. Patients' files who applied to Baskent University Ankara Hospital between January 1st 2012 and December 31st 2014 were investigated for Vitamin D, BMD, calcium, phosphorus and parathyroid hormone. Patients with abnormal levels of calcium or phosphorus or parathyroid hormone will be excluded from the study. All data are recorded and analyzed using the SPSS software.

RESULTS: Out of 51 patients, 5,9% (n=3) was male while 94,1% (n=48) was female. The mean age of patients was found to be 57,9 years. 23,81 was the mean value of Vitamin D whereas average T scores of L1-L4 and femur neck were found to be -1,442 and -2,112 respectively.

CONCLUSIONS: We believe that there is a direct relationship between Vitamin D and BMD score despite no significant correlation found yet between Vitamin D and BMD scores among this limited number of patients. The study and data collection still continues.

Keywords: Vitamin D, BMD score, parathyroid hormone, calcium, phosphorus.

OP-044

Patient empowerment: a life changing practice or an illusion

Burcu Gürhan, Tuğrul Bıyıklıoğlu, Mehmet Urgan
Department of Family Medicine, Ankara University, Ankara, Turkey

BACKGROUND & AIM:

Patient empowerment has been on the focus of researchers working on patient education, chronic disease management, patient-centred medicine, e-health/tele-health interventions, health policy & administration for decades. In spite of a wide literature, there hasn't been a consensus over the core elements of empowerment and the proper way of integrating into health care system. The aim of this study is to: review literature regarding patient empowerment; identify related concepts and prerequisite qualifications; determine barriers & facilitators of implementation in real world health care settings; address issues concerning measurement of outcomes.

METHODS:

We conducted a search using key words "patient empowerment" in Web of Science (W.O.S.) database, through January 1960 to October 2014, among articles published in English. Non-health related topics were excluded in order to refine the search. Additionally, we searched web for related articles as an outside source.

RESULTS:

411 articles were extracted from database search and 36 additional were found on the web search. 8 articles were identified as duplicates and excluded. 439 articles were included in initial review. Based on title and abstract review and full text availability, a selection method was processed. 192 articles met the eligibility criteria and were included in detailed review.

CONCLUSION:

Current health care system is overwhelmed by the burden of chronic diseases. There is an urgent need for a paradigm shift. The concept of patient empowerment can answer the purpose but it is far from being well established. A consensus has to be built about the definition. Uncertainties regarding measurement of outcomes have to be clarified. Additionally, empowerment is not a stand-alone concept and related issues like self-management, health literacy, shared decision making and patient-centred medicine have to be taken into consideration. If we take necessary actions, health care system will come out of this crisis stronger.

Keywords: patient empowerment, self-management, chronic disease management, patient-centred medicine

⁴Cabinet Medical de Medicina Familiei Dr. Carmen Roman

⁵Cabinet Medical de Medicina Familiei Dr. Iuliana Zarici

⁶Cabinet Medical de Medicina Familiei Dr. Ioana Budiu

⁷Centrul Medical Dr. Stefanescu SRL

BACKGROUND:

With aging lipid parameters tend to modify. This represents a risk factor which is useful to monitor in Primary Practice. Arterial elasticity represents the opposite of the arterial stiffness. It shows how elasticity decreases with age.

Research question:

Can we establish a correlation between lipid parameters and the arterial stiffness in hypertensive persons?

METHOD:

We selected 120 hypertensive individuals aged 40 to 80 years. Cases with secondary hypertension were not included in the study. Lipid parameters of these individuals were measured using the Guideline for the Management of Hypertension (European Society of Cardiology / European Society of Hypertension). Pulse Wave Velocity (PWV) of the aorta has also been measured (as the gold standard for arterial rigidity) using an Arteriograph (Medexpert). We tried to establish a correlation between lipid parameters and PWV.

RESULTS:

We found the following results:

A) The PWV=9.29m/s, Standard Deviation (SD) = +/-1.94) and Total Cholesterol (TC) = 209mg/dl SD=+/-48.2, correlate linearly with Pearson index $r=0.481$.

B) PWV=9.29m/s and LDL cholesterol (LDLc)=116mg/dl +/-49.8, correlate linearly with Pearson index $r=0.505$.

C) Triglycerides (TG) = 148mg/dl SD=+/-121 and PWV correlate linearly with Pearson index $r=0.389$,

D) Also HDL cholesterol (HDLc) =48.1mg/dl SD=+/-12.9 and PWV negatively correlate with a Pearson index $r= -0.354$.

CONCLUSIONS:

Evaluating aortic stiffness and lipid parameters are useful in the evaluation of hypertensive patients with cardiovascular risk. Arterial stiffness measured using with an Arteriograph directly correlates with TC, LDLc and indirectly with HDLc.

Keywords: Lipid parameters, elasticity of great arteries, hypertensive patients.

OP-046

Dietary behaviour of Hindustani immigrants with type 2 diabetes mellitus

Cristina Sandu Blendea, Gertrudis Garcia Quezada, Marta Gamez Salvado, Judit Llussà Arboix, Eulalia Borrell Thio, Eva Muñoz Mata, Núria Montellà Jordana
Catalan Health Institute, Barcelona, Spain

Background and AIMS:

The Hindustani who migrate have higher prevalence of diabetes mellitus type 2 (T2DM) for their genetic predisposition, increased risk of central obesity, sedentary lifestyle, westernization and acculturation diet (rich in carbohydrates).

OBJECTIVE: To determine the characteristics of the diet and the level of metabolic control of Hindus patients with T2DM attended at primary care medical center.

METHODS:

Cross-sectional study design was used to evaluate T2DM patients over 18 years old, born in Bangladesh, India or Pakistan attended in the Sant Roc primary care center from Badalona (Spain). Pregnant women, terminally ill patients or with dementia were excluded. Evaluative parameters from clinical interview and review of medical records: demographic data, waist circumference, glycated haemoglobin (HbA1c) value, treatment of T2DM and 24-hour dietary recall. Carbohydrate distribution and type of diet (hypo/normo /hypercaloric) was calculated.

RESULTS:

Final sample: 82 patients. Women =22 %. The average age =48.5 years (SD± 8.7). Rural origin =48.8 %. Poorly controlled HbA1c = 50.6 % (13.6% with HbA1c > 10). The 3.8% of poorly controlled patients do not perform drug treatment. Central obesity in 56% of the total and 41% of those with BMI < 30. The 96.3 % consume home-cooked food. Vegetarians=4.9%. Proportion of nutrients: carbohydrates excess =62.2%; lipid deficit =89%; protein deficit = 31.7%. Only 3.7% patients distributed carbohydrate well throughout the day; 50% carry the main consume at night (dinner). Type of diet: 65.9% hypocaloric; 12.2% normocaloric. More than 50% do proper exercise.

CONCLUSIONS:

Hindustani diabetic patient is young, with central obesity and poor glycemic control. It has not given the phenomenon of acculturation. The waist circumference is more useful than BMI to assess obesity. Most patients perform improper diet: hycaloric diet with deficit of protein and lipids and excess of carbohydrates, poorly distributed throughout the day.

OP-047

The effects of structured follow-up from primary care during the cancer continuum. Study protocol of the GRIP-study

Jetje A.A. Perfors¹, Charles W Helsper¹, Anne M May¹, Elsken Van Der Wall², Niek J De Wit¹

¹Department of Julius Center for Health Sciences and Primary Care, University Medical Center Utrecht, Utrecht, the Netherlands

²Department of Internal Medicine and Dermatology, University Medical Center Utrecht, Utrecht, The Netherlands

Background & AIM: Due to the ageing population and improving treatment the number of cancer patients and cancer survivors is increasing. Policymakers, patients, specialists and GP's advocate a larger role for the primary care starting at diagnosis. The assumption is that this could stimulate integrated care, decrease costs and would better meet the patients' expectations. However, the effect of structured follow-up from primary care during the cancer continuum has not been studied yet.

The present study aims to evaluate the effect of structured follow-up from primary care in addition to usual care, on satisfaction with care and healthcare utilization for cancer patients treated with curative intent.

METHODS: We will conduct a multicenter, two-arm randomized controlled trial in The Netherlands. We will enroll 150 patients who will be treated with curative intent for either prostate-, breast-, lung-, colorectal cancer or melanoma. Further inclusion criteria are: age 18 years and older, a sufficient mastery of the Dutch language and a general practitioner (GP) who participates in the study. Control patients will receive usual care. The intervention arm will receive usual care and guidance by a GP and a primary care oncology nurse. First, a GP consultation follows directly after diagnosis to empower the patient for shared decision making (SDM). Hereafter, a minimum of five contacts with the nurse, including one home visit, will follow. Primary outcomes are: patient satisfaction and healthcare utilization. Secondary outcomes include quality of life, mental health, patient empowerment, SDM, sick leave and satisfaction with provided information. Measurements will be performed on specified cancer care milestones, within a maximum 1-year follow-up period.

CONCLUSIONS: This randomized controlled trial evaluates structured follow-up from primary care in addition to usual care. Findings from this study will inform stakeholders to design a framework for optimal follow-up for cancer patients, starting at diagnosis.

OP-048

Integrating Palliative Care in Primary Care

Ana Nunes Barata

USF Amora Saudavel

BACKGROUND:

The need to increase the number of healthcare professionals involved in palliative and end-of-life care is a healthcare priority in developed nations. In 2050, WHO estimates that two billion people will be over 60 years old. Chronic diseases will be more prevalent and the main health burdens for older people will come from noncommunicable diseases. It is therefore important to develop and adapt Primary Care to this setting, preparing primary care physicians to provide good palliative care at patients' homes and relieving the uncertainty that these physicians sometimes feel about the best management option and their role when caring for a patient with palliative needs.

METHODS:

Revision of articles published on PubMed featuring the MeSH terms "Palliative Care" and "Primary Health Care".

RESULTS:

The 18 analyzed studies show that good palliative care provided by primary care physicians has several positive outcomes, including patients dying in their place of preference, improved patient education and better symptom management. Models where primary care providers look after the palliative patient have also shown to be cost-effective within the healthcare service.

CONCLUSIONS:

The work of primary care physicians is defined by a bio-psycho-social approach to the patient. The physician gets to know not only the patient, but also the patient's family, which means he is in a privileged position to provide adequate palliative care to the patient. This presentation's goal is to show some results of palliative care interventions carried out by primary care physicians and to stress the importance of integrating formal palliative care provision in the usual practice of a primary care physician, so as to provide a greater sense of comfort to patients.

OP-049

Self-reported Hindering Health Complaints Of Community-dwelling Older Persons

Sophie C.e. Van Blijswijk, On Ying A. Chan, Anne H. Van Houwelingen, Jacobijn Gussekloo, Wendy P.j. Den Elzen, Jeanet W. Blom

Department of Public Health and Primary Care, Leiden University Medical Center, Leiden, The Netherlands
Background and aim

Proactive care for community-dwelling older persons targeting self-reported hindering health complaints might prevent a decline in function. To effectively offer proactive care, knowledge of which complaints hinder older persons most from day-to-day is needed. Therefore, the aim of this cross-sectional study was to acquire insight in the broad spectrum of self-reported hindering complaints of community-dwelling older persons, the association with functional outcomes, and the awareness of GPs concerning these complaints.

Method

Within the ISCOPE trial, participants (aged 75+) received the ISCOPE screening questionnaire. Answers to the open question "At the moment, which health complaints limit you the most in your day-to-day life?" were coded according to the ICPC-1-NL. We examined the prevalence and the association between the number of complaints and functional outcomes (Groningen Activities Restriction Scale [GARS], Cantril's Ladder, Mini-Mental State

Examination [MMSE], Geriatric Depression Scale-15 [GDS-15], and De Jong Gierveld Loneliness Scale [DJG]). Electronic patient registers (EPR) of 4360 participants were gathered and searched for the most reported complaints.

Results

In total 7285 persons participated (median age: 81.0 years [IQR 77.8-85.3], 38.6% males). 2379/7285 participants (32.7%) reported no complaints. The others reported 13,524 complaints (median 1, range 0-18). Most reported were problems with walking/standing (n=1609, 22.1%), pain (n=1515, 20.8%) and weakness/tiredness (n=620, 8.5%). In the EPRs these complaints were also mentioned in respectively 28.3%, 91.3% and 55.5%. A higher number of self-reported complaints was related to poorer scores on the GARS, Cantril, GDS-15, and DJG.

Conclusion

One third of the participants reported no complaints. Problems with walking/standing, pain, and weakness/tiredness were most reported, but often not found in EPRs. The number of complaints was associated with poorer scores on functional outcomes. GPs should ask about these complaints and their influence on daily life as a basis for proactive care.

Fear of falling

Lourdes Martin¹, M Victoria Castel², Angel Otero³

¹Dirección Asistencial Oeste, Gerencia de Atención Primaria, Madrid, Spain

²Centro de Salud Dr. Castroviejo, Madrid, Spain

³Departamento de Medicina Preventiva y Salud Pública, Universidad Autónoma de Madrid, Madrid, Spain

BACKGROUND AND AIM

Numerous studies analyze the risk factors associated with fear of falling. Many of them showed that fear is a direct consequence of the fall.

The aim of this study is to estimate the prevalence and associated factors of fear of falling on an urban population in Madrid.

METHOD

Cross-sectional study of the basal population of the "Peñagrande cohort". A semistructured survey was performed between June 2007 and June 2008. Two measures of fear of falling were used: direct question and Tinetti's FES scale.

Individuals over 65 years of age, living in the district of Peñagrande in Madrid. Was selected 814 subjects by means of a stratified random sampling.

RESULTS

A 73.3% response rate was achieved. Average age was 74.8 years with 48.5% of males. The prevalence of fear of falling was 56.9% when a direct question was used and 45.6% with Tinetti's FES scale. These figures reach 75.1% and 65.3% respectively in those who have suffered a previous fall (51.5% and 42.4% in those who have not suffered any). Fear increases with age, is more frequent in women, and in those living alone or with low incomes. It is associated to the diagnosis of depression, taking more than 4 drugs simultaneously, inadequate prescriptions or drugs, and the use of drugs with central nervous system activity. Fear of falling is associated to disability, functional impairment, obesity, frailty, and equilibrium disorders.

CONCLUSIONS

Fear of falling is highly prevalent among elderly subjects and has a strong correlation with multiple risk factors. It may trigger functional abnormalities and a decrease on physical activity. This could lead to a state of inability, dependence and institutionalization that may result in psychological and quality of life impairment. Fear of falling must be managed to prevent the development of such a "fear spiral".

Follow up of 167 INRs in elderly patients under anticoagulants: compliance of medical decisions with guidelines for overdosage management

Gerard Nguyen¹, Dominique Le Moul¹, François Sigwald³, Gladys Arbaud², Thérèse Postelnicu², Isabelle Penel³

¹Cabinet Marcel Monny Lobe, Soisy Sous Montmorency, France

²EHPAD Arpage Jacques Offenbach, Arpad, Epinay sur Seine, France

³EHPAD La Cerisaie, Montmorency, France

More than 1% of the total population in France are under treatment by oral anticoagulants using Vitamin K antagonists. Use, misuse, underuse and overuse are frequent. National guidelines of good practices for overdosage management by using INRs of patients under anticoagulants have been widely published. We underwent a survey of 167 INRs performed in 2 nursing homes in 18 patients over 80 years old under Vitamin K Antagonists during the last six months. All were asymptomatic of bleeds. The results were classified into 5 groups with the respective distribution: A (INR <2):38.92% (65/167), B (2 ≤ INR <3): 51.49% (85/167), C (3 ≤ INR < 4):9.58% (16/167,) D (4 ≤ INR < 6): 1.79% (7/167),E (INR ≥ 6):3/167. While INR ≥ 4, guidelines recommend to skip the intake of the prescribed dose, we found only 57.13% of compliance to guidelines (4/7 in group D). And while INR ≥ 6 we found 66.66% of patients having their treatment stopped and with the oral administration of 1 to 2 mg Vitamin K.

An overall of 15.6% of the patients > 80 years old had an overdosage with an INR > 3 knowing that the risk of bleeds in elderly patients remains high.

Our survey showed that half of the elderly patients having oral anticoagulants were well controlled with an INR between 2 and 3, In patients with asymptomatic overdosage, decisions in accordance with guidelines could be improved. Overdosage with an INR > 6 should be managed perfectly by applying systematically the national guidelines. Administration of oral vitamin K may be done by nurses while INR > 6 in case of non availability of the primary care practitioner for the decision.

Reliability and Validity Study of Hwalek-Sengstock Elder Abuse Screening Test (H-S/East)

Nilgün Ozcakar¹, Akca Toprak Ergonen², Mehtap Kartal¹, Hakan Baydur³

¹Department of Family Medicine, Dokuz Eylul University Medical Faculty, Izmir, Turkey

²Department of Forensic Medicine, Dokuz Eylul University Medical Faculty, Izmir, Turkey

³School of Health, Celal Bayar University, Manisa, Turkey

Background & Aim

Elder abuse and neglect is an important social issue that is discussed worldwide. Its objective measurement is important for recognition and prevention. We aimed to determine reliability and validity of the Turkish version of the "Hwalek-Sengstock Elder Abuse Screening Test (H-S/East)" developed for determining of abuse or neglect in elderly.

Methods

H-S/East has 15-item, three-dimensional structure: direct abuse, characteristics of vulnerability, and potentially abusive situation. It's translated according to guidelines, experts evaluated for content validity and cultural adaptation then test-retest reliability was studied. WHOQOL-OLD.TR and Barthel Index was used for the relationship between H-S/East validity. Volunteered 252 elderly participants were visiting family health centers. Cronbach's alpha for internal consistency, exploratory factor analysis for content validity, chi-square test for construct validity and for discriminant ability was used. ROC curve was used for cutoff point, sensitivity, and specificity and under area are then calculated. SPSS 15.0 was used for analysis. Significance was p <0.05.

Results

The mean age was 73.4±6.4 and 58.3% was female. Approximately 54.8% married, and 90.9% used drugs

regularly. There's no significant differences according to gender in total and all three dimensions of H-S/East scale ($p>0.05$). In the test-retest reliability, ICC values for direct abuse, characteristics of vulnerability, and potentially abusive situation were 0.88, 0.73 and 0.80, respectively.

Cronbach's alpha for internal consistency H-S/East the total score was 0.741. Exploratory factor analysis was obtained 5 factors and explained variance was calculated 61.8%. According to self-report abuse, 11 items was obtained for the construct validity, and discriminant analyses used that correctly classified items was 94.8%. Cutoff value was 6, and sensitivity, specificity, and under area in the ROC curve were 76.9%, 96.2%, 0.938, respectively.

CONCLUSION: Turkish version of Hwalek-Sengstock Elder Abuse Screening Test can be used as a reliable, valid clinical tool for the assessment of elder abuse.

⁴Department of Internal Medicine, Muğla Sıtkı Koçman University Medical Faculty, Muğla Turkey

⁵Department of Neurology, Muğla Sıtkı Koçman University Medical Faculty, Muğla Turkey

⁶Department of Emergency Medicine, Muğla Sıtkı Koçman University Medical Faculty, Muğla Turkey

Background and AIM: Loneliness, low level of social support, lacking a valid caregiver, declining cognitive function have effects on morbidity, mortality and life quality in elderly. On the other hand, several elderly patients have both dementia and major depression. Major depression may be a risk factor or a comorbid disorder for dementia. It is difficult to distinguish cognitive impairment in dementia and major depression. Depression also effects quality of life. The aim of this study was to assess social support status, cognitive functions, depression and life quality of home care patients registered to Muğla Sıtkı Koçman University Training and Research Hospital Home Care Unit in Muğla province (Turkey). This study is a part of comprehensive geriatric assessment project conducted in this unit.

METHOD: In this cross-sectional study, social support is determined with Multidimensional Scale of Perceived Social Support. We also investigated social Networks like living marital partner, living offspring and siblings, other relatives or a care-giver, social relationships, sociodemographic factors and chronic conditions. We measured mental health using Geriatric Depression Scale and Mini Mental State Examination (MMSE). With MMSE, cognitive capabilities of the participants were evaluated such as orientation, attention, concentration, memory, calculation, language and praxis. For life quality investigation, we used World Health Organization Quality of Life instrument brief version (WHOQOL-BREF).

RESULTS: 143 elderly participated to the study. Average age was 82.1 ± 7.4 (Min:65, max:103). According to MMSE, 75.5% (108) of the patients had severe dementia, 16.0% (23) of them had mild dementia and 8.3% (12) were normal. 88.1% (126) had severe depression, 7.7% (11) of them had mild depression and 4.2% (6) had no depression.

CONCLUSION: In this study a high prevalence of depression and dementia were found. In the second step, these patients will have an advanced evaluation for dementia and depression and will be given treatment if necessary.

Elderly satisfaction with primary physician's health education in waiting room of pension bank: its causes and effect to institution image

Aria Kekalih¹, Fithriyyah Sha², Idqan Fahmi²

¹Community Medicine Department, Faculty of Medicine Universitas Indonesia, Jakarta-Indonesia

²Graduate Program of Management and Business – Bogor Agricultural University (IPB), Bogor-Indonesia

INTRODUCTION:

When health education program to recognize and prevent degenerating disease was considered important to elderly, a national pension bank in Indonesia set initiative to provide additional services in form of health education and consultation. Elderly community came and gathered regularly in pension bank at the first week of the month. Therefore, bank tried to optimize this momentum by performing health education and consultation program in the waiting room, cooperated with trained primary physician. This study investigates how elderly satisfy with the program and consider it important, and also how it might build positive image to the institution.

METHOD:

We investigated 342 elderly in 14 cities of bank branches in Indonesia who participated in health education and consultation program. We assessed their satisfaction level related to health education and its cause using SERVQUAL approaches. We also investigated how it would trigger individual willingness to spread word of mouth in promoting the health education program and the institution to other elderly, using standardized equation modeling (SEM) analysis.

RESULT:

Most of elderly satisfy and understood the health education content (90%) and considered this program as meaningful program (84%). Tangibles factor (educator and doctor performance) and reliability (delivery method of health education content) are the highest factor contributes to elderly satisfaction. Health consultation contributed more in triggering word of mouth to promote the program and institution (SEM $r=0.81$) rather than of health education (SEM $r=0.58$)

DISCUSSION:

Elderly value health education and consultation in pension bank as a satisfying and meaningful program to optimizing and creating quality time while queuing. Health educator performance, and also health content delivery method were considered important key factor to successful health education for elderly. This approach was also potential in building institution positive image

OP-055

The Use of ICPC-2R to Intensify Diagnosis in Remote Primary Care of West Papua Province, Indonesia

Harry Allan Papendang¹, Trevino Aristarkus Pakasi²

¹Faculty of medicine Universitas Papua

²Division of family medicine, department of community medicine, Faculty of medicine Universitas Indonesia;

Background. Primary care (Puskesmas) in Indonesia used ICD-10 to classify diseases although it was difficult to prove in limited facilities. The ICPC was introduced to Puskesmas Malawili, in Sorong Regency, West Papua Province, in collaboration with the new medical school of West Papua and Universitas Indonesia. The study aimed to describe the experience of using the two classification systems in the remote primary care.

Method. The cross-sectional study, done in February 2015, was held in Kampung Malakabu where the Puskesmas visited monthly due to geographical constrain. As usual, doctors examined patients and classify the diagnoses using the two systems, first using the LB1 form (ICD-10) as reported by Puskesmas, and ICPC-2R. Then we compared the results.

Result. Eighty seven patients came for consultation. They were 46% male, 65.5% adults >18 years. Mean age of the adults was 34.3 years and children was 5.9 years. The most chief complains was coughing (ICPC code R74) followed by muscle pain (L18). The most three diagnoses were acute upper respiratory tract infection (R74),

muscle pain (L18) and stomach function disorder (D87). The data was compared with the February data of the Puskesmas Malawili, which classified the first three diagnosis as: acute respiratory tract infection, rheumatic, other diseases i.e gastritis. We found that the use of ICPC gave more precise diagnosis rather than filling the monthly report form based on ICD 10. For example, the use of upper respiratory infecton was more precise than acute respiratory infection, since the anatomical site was determined; rheumatic was often used to describe muscle or bone complains even though without laboratory confirmation, as in the LB1 form.

Conclusion. Although it's still too early, we concluded that the use of ICPC-2R gave more precise diagnosis as it was easier to implement, compared with using ICD-10.

OP-056

Iron Supplement In Mild Anemic Pregnant Women: Are We Have An Option?

Adibah Hanim Ismail¹, Haniza Hashim², Juwita Shaaban³

¹Department of Family Medicine, Universiti Putra Malaysia, Serdang, Selangor, Malaysia

²Pendang Health Clinic, Kedah, Malaysia

³Department of Family Medicine, Universiti Sains Malaysia, Kubang Kerian, Kelantan, Malaysia

Background

The objectives of this study is to determine the effectiveness of weekly versus daily iron supplements among mild anemic pregnant women attending antenatal clinic at a Maternal and Child Health Clinic at East Malaysia

Methods

Randomized controlled trial was done over a six- month period. Seventy pregnant women at 12-20 weeks of pregnancy with Hb level of 9-11gm/dL were enrolled in this study. Patients were randomized equally into 2 groups. Patient in the daily group received 200mg of ferrous fumarate to be ingested daily, whereas those in weekly group received 2 tablet of 200mg of ferrous fumarate to be ingested once a week. Hemoglobin and serum ferritin level were taken at first visit and 8 weeks later.

Results

Majority (92.9%) of the participants were Malays and maternal age ranged from 16 to 42 years. Mean gestational age at baseline was 14 weeks. The response rate (RR) for both groups were 100%. The compliance was good in both groups and no adverse side effects were reported. At first visit, the haemoglobin and ferritin level in the daily group was 10.4g/l and 71.7µg/l and for weekly group was 10.5g/l and 79.4µg/l respectively. After 8 weeks of iron supplementation, the hemoglobin and ferritin level in daily group was 10.5g/l and 74.4µg/l and in the weekly group was 10.2g/l and 78.6µg/l respectively. Iron supplementation among mildly anemic women in either daily or weekly groups did not show any significant difference in the hemoglobin(p= 0.078) and ferritin levels(p= 0.933) after 8 weeks.

Conclusion

Pregnant women has an option to choose either 200mg ferrous fumarate daily or 400mg ferrous fumarate weekly for their anemic treatment.

Keywords: pregnancy, iron supplement, anemia

Postpartum Depression and Mood Assessment of Mothers and Babies

Bilge Sönmez¹, Burcu Kayhan Tetik², Engin Burak Selçuk², Melek Kılıç³, Feyza Bezirgan Sarıgözel⁴, Ismail Hamdi Kara⁴, Ergün Öksüz⁵, Mustafa Agah Tekindal⁶, Mehmet Akif Terli⁷, Makbule Öztürk⁸

¹Çerkeş State Hospital Family Medicine, Çankırı, Turkey

²Inonu University Department of Family Medicine, Department of family medicine, Malatya, Turkey

³Republic Of Turkey Ministry Of Health-Child Adolescent Health Department, Ankara, Turkey

⁴Düzce University Department of Family Medicine, Department of family medicine, Düzce, Turkey

⁵Başkent University Department of Family Medicine, Department of family medicine, Ankara, Turkey

⁶Başkent University, Faculty Of Medicine, Department Of Biostatistics, Ankara, Turkey

⁷Kahramanmaraş province health Directorate Child Adolescent Health Department, Kahramanmaraş, Turkey

⁸Antalya province health Directorate Child Adolescent Health Department, Antalya, Turkey

Introduction and AIM:

Non-compliant interaction with baby can prevent the achievement of maternal role. The postpartum period is considered with increased risk for various mood disorders and women are the most vulnerable emotionally in this period. Mood disorders seen during this period affects not only mother and baby but also the rest of family with serious long-term consequences and it may take a life-time without treatment. In our study, we aimed to determine postpartum depression frequency in Turkey.

MATERIAL-METHOD:

Our study is cross-sectional descriptive; in Turkey's 10 provinces (Diyarbakir, Malatya, Ankara, Cankiri, Ordu, Samsun, Kahramanmaraş, Sanliurfa, Istanbul and Antalya) 3000 mothers in total within the first postpartum year will be held, study is completed in Cankiri, Istanbul and Antalya and preliminary study results are presented. Sociodemographic questionnaire, Edinburgh Depression Scale(EDS) and Maternal Attachment Scale(MAS) was administered. All data was evaluated in SPSS (Version 17, Chicago, IL, USA). Statistical significance was accepted as $\alpha = 0.05$.

RESULTS:

In our study there was a total of 256 mothers including 74 from Cankiri, 44 from Antalya and 138 from Kahramanmaraş. The mean age of participants is 27.43 ± 4.8 , 36% were primary, 29% high school and 29% were university graduates. 61% of mothers were housewives, 21% of civil servants, 8% of mothers were working in private sector. In 21% of mothers' the monthly income was below 1000 ₺, 32% has 1000-2000 ₺ and 12% has 4000 ₺ and over. 21,5% of mothers' EDS score was 12 and over. Average MAS score was found 99,4(SD:7,505).

CONCLUSION:

Identifying emotional problems in postpartum period early and providing necessary assistance and support should be considered in commission and scope of authority of family physician as the leader of patients' all health situations.

Keywords: postpartum, depression, maternal attachment

OP-058

Following up pregnancies in primary care; Are we adequate?

Ipek Tanyıldızı

Abdulkadir Konukoğlu Aile Sağlığı Merkezi, Gaziantep, Turkey

BACKGROUND: Following up pregnancy is the most important part of family medicine. Women can be prevented from complications of pregnancy by regular follow up and true manipulation. The aim of this study is to evaluate risk factors of pregnancy in primary care.

METHOD: Pregnant women who applied to our family medicine unit, between September 2012 and December 2014 and accepted informed consent, involved to the study. Their files were examined retrospectively. Risk factors according to pregnancy and effects of these risks after birth were determined.

RESULTS: 161 pregnant women were followed until their birth. 19.3% of pregnant women were more than 35 years, 28.6% of them were overweight and 49% had risk factors for pregnancy (Consanguinity(18%), thyroid diseases(11%) and Rh incompatibility(10%)). The mean hemoglobin value was 12.1g/dl at the beginning and 11.4 g/dl at the last visit. Mean value of 50-gram glucose challenge test (GCT) was 121.6 mg/dl. Birth average was 35 week (median=38 week). 88.8% of them were live birth and 11.2% were stillbirth or abortion and most of them concluded as cesarean delivery (58.4%). Pregnants whom ≥ 35 years old had significantly increased body mass index ($p=0.043$), systolic blood pressure ($p=0.028$). Also abortion or stillbirth, low birth week ($p=0.001$) and cesarean delivery ($p=0.02$) had mostly seen in these women. When serum glucose in GCT was more than 140 mg/dl, risk of prematurity ($p=0.034$) and postnatal morbidity were also increased ($p=0.049$).

CONCLUSION: Nowadays older age pregnancies and age related risks are increasing, so that complications of birth can be seen both in mother and baby. This can be avoided by regular following up pregnancies in primary care.

Keywords: primary care, pregnancy risks, preventive care.

Does unplanned home birth affect use and context of prenatal and postnatal care services

Binali Çatak¹, Can Öner²

¹Kafkas University School of Medicine

²Istanbul Bilim University School of Medicine

And adequate prenatal (PNC) and postnatal (PoNC) care services decrease infant and maternal mortality. Not only the quantitative features but also the qualitative features of these services are important and can be change according to social factors. In this study, it was aimed to evaluate these services given by family physicians at primary care level and by obstetricians at secondary and tertiary care levels in Istanbul in terms of quantity and quality in home delivery and hospital delivery groups.

The data of this study was derived from part of prenatal and postpartum care of an other case control study namely " Unplanned home birth and affecting factors". The "case" group consisted of 229 women who had "unplanned home deliveries" and "control" group (n=458) of women giving birth in hospitals.

15,6 % (n=27) of case and 3,4% (n=13) of control group do not receive any PNC, where as 4,0% (n=7) of case and 2,1% (n=8) of control group receive PNC only from family physician. Most of the women in both groups receive PNC form family physician and obstetrician (46,2% (n=80) vs 61,9% (n=239) respectively) (p=0,001).

39,9 % (n=69) of case group and 38,7% (n=149) of control group do not receive any PoNC, where as 50,9% (n=88) of case group and 35,3% (n=136) receive PoNC from family physician. The rate of PoNC receive from obstetrician was 9,2% (n=16) in case and 26% (n=100) in control groups (p=0,001).

When the PNC assessed quantitatively and qualitatively all parameters showed significantly difference between the case and control groups except cardiac auscultation. On the other hand receiving PoNC parameters only abdominal examination and bleeding control showed significant difference between two groups.

It was shown that the context of PNC and PoNC was show significant difference according to place of delivery.

An Evaluation of knowledge of Health Care Personnel, working in Primary Healthcare facilities, about Breastfeeding and Lactation Consultancy

Engin Burak Selcuk¹, Burcu Kayhan Tetik¹, Melek Kılıç², Bilge Sönmez³, İrep Karataş Eray⁴, Makbule Öztürk⁵, Mehmet Akif Terli⁶

¹Department of Family Medicine, Inonu University, Malatya, Turkey

²Department of Child Health, Republic of Turkey Ministry of Health, Ankara, Turkey

³Çankırı State Hospital, Çankırı, Turkey

⁴Ankara Atatürk Research and Training Hospital, Ankara, Turkey

⁵Department of Child Health, Antalya Public Health Directorate, Antalya, Turkey

⁶Department of Child Health, Kahramanmaraş Public Health Directorate, Kahramanmaraş, Turkey

WHO and UNICEF recommend breast-feeding babies exclusively for the first six months and continuing breast-feeding with adequate complementary food for up to two years of age. Training of breastfeeding, beginning especially after the 32th week of pregnancy, has been proven to increase the duration of breastfeeding, in many studies.

The aim of our study is to define the level of knowledge, attitudes and behavior of the healthcare personnel working in primary care facilities, about breastfeeding, in 10 cities of Turkey (Diyarbakır, Malatya, Ankara, Çankırı, Ordu, Samsun, Kahramanmaraş, Şanlıurfa, İstanbul ve Antalya). Our study is planned to be carried out with a total of 3000 healthcare personnel. In the current report preliminary study results of Diyarbakır, İstanbul and Antalya are presented.

MATERIALS-METHODS:

In the analysis of the data SPSS, Chicago, IL, Version 17 program was used. A value of p<0,05 accepted as significant.

RESULTS:

Some socio-demographic data of the participants are presented in Table 1.

The question "Which of the following is suggested for healthy generations?" is answered correctly as "the first 6 months of exclusive breastfeeding, continue breastfeeding with additional food up to 2 years" by a total of 394 (87.8%) participants, including 142 (87.7%) in Diyarbakir, 156 (82.5%) in Kahramanmaraş, and 96 (98.0%) in Antalya.

The answers to the question "What additional food would you recommend, if the mother's milk is insufficient" are given in Table 2.

CONCLUSION: Family physicians and healthcare personnel who provide continuous care should consider every application as an opportunity. We believe the family physicians may further improve the ratio of breastfed babies by providing the mother candidates in their population with breastfeeding training and information about problems that might be experienced possibly and how to deal with them through scheduled training sessions.

“Steps for Health”- interdisciplinary team physician- pre-school educator- parent

Laura T Comnea¹, Eugenia A Iorgulescu²

¹Private Practice Dr Comnea Laura

²MiniClub Condor Iorgulescu Eugenia

Background

The first admission of a small child in the community(nursery, kindergarten), induce concerns for parents, challenges for pre-schol educator, for doctor who take care of that collectivity. Regarding the baby: often, the child feels stress induced by the separation from his parents, contact with other children, rules. From studies and literature dedicated to the subject, they are large limits regarding optimal moment for entering the community of a small-child: 6 months (socially involved mothers) to 4 years.

Purpose

To present the impact of early collectivity over the neuro-psycho-motor development of the child

OBJECTIVES:

1. Neuro-psycho-motor development from 1 to 3 year of age
2. Impact of the early community admittance on the child's health
3. Interdisciplinary team training for optimal child care

Material and method

The authors present a retrospective observational study developed between 2011-2013.They folowed and compare three groups of 12 children(totally 36 children)

There were recorded:

- physical parameters- weight, height, cranial perimeter, dentition,
- neuro-psycho-motor development: walk, sight, hearing, speaking, behavior
- pathological,
- intervention methods in managing child reactions when he is separate from the parent
- the role of the informed consent of parents on first aid cases, parents counseling for immunisations, nutrition,
- daily physical exercises
- changes in the children's behavior.

The children were examined by the doctor weekly

All staff went through special training in:basic child care, first aid, elementary psychology of toddlers. Parents were involved in joint activities with their children

Conclusions

- 1.Small collectivities are ideal model to maintain an optimal health for children
2. As the child is younger when he enter in the community, the neuro-psycho-motor development are faster and the acquisitions more complex
- 3.The interdisciplinary team doctor- pre-schol educator-parent remain a solution, in order to obtain good results in raising and educating healthy young child.

OP-062

Should I Supplement Vitamin D During Pregnancy? Frequency Of Vitamin D Supplementation Intake Among Pregnant Women in Ankara and The Related Affecting Factors: A Survey Study

Zeynep Sayın Dincer¹, Gökhan Dincer², Aybüke Demir Alsancak¹, Duygu Ayhan Başer¹, Zeynep Keskin¹, Aysu Duyan Çamurdan³

¹Department of Family Medicine, Ankara Numune Training and Research Hospital, Ankara, Turkey

²Department of Family Medicine, Ankara Training and Research Hospital, Ankara, Turkey

³Department of Social Pediatrics, Gazi University, School of Medicine, Ankara, Turkey

BACKGROUND AND AIM: In term of its effect on maternal and infant health, vitamin d deficiency is stil an important public health problem. The republic of Turkey ministry of health published a circular to improve maternal and infant health by preventing perinatal/maternal vitamin d deficiency. And it was suggested that all pregnant and lactating women be supplemented vitamin d per a day 1200U.

The aim of this study were to determine usage of rates vitamin d supplement among pregnant women living in city of Ankara and to examine the factors associated with this condition.

METHOD: The data of descriptive research were collected by a questionnaire form. A questionnaire was administered to all postpartum (in first mounth) women attending to well baby clinic in February- july 2015. The questionnaire form included open-ended and closed questions regarding the descriptive characteristics and about to intake of vitamin d during pregnancy. The questionnaire form was completed by individually.

RESULTS: Present we report the preliminary results but all results will be presented in 20th wonca conference. The mean age of the study population were 29,63(±5,395) years. The use of vitamin supplementation in pregnancy was 46,7%. And only 41.1% of these mothers had been proposed enough dose vitamin d (1200U). In the study, it was found the following as reasons for not taking vitamin D supplements: the lack of doctor's recommendation, to write harmful for pregnant women in medicine prospectus and to be at normal levels of vitamin D levels.

CONCLUSION: There many different opinions on about use of vitamin d supplement in pregnancy and that is one of the most important reasons influencing prenatal vitamin d intake. Future studies need to be conducted with larger samples before the findings can be accepted with a greater degree of confidence.

OP-063

An qualitative evaluation of the prenatal in Brazil

Lara Louise Guimaraes Silveira, Rickella Aparecida Alves Moreira, Izabela Maciel Saraiva, Leila Medeiros Melo Faculdade de Medicina, Universidade Federal de Goiás, Goiás, Brasil

Background & Aim

Pregnancy, in most cases, has its evolution uneventful but requires special care. Objective prenatal counsel women from the beginning of pregnancy, seeking to ensure, at its end, the birth of a healthy child and ensure the maternal and neonatal well-being. The objective of this study is to evaluate the perception of mothers as prenatal care received, showing the greater significance factors among pregnant women and service.

Method

We conducted a qualitative analysis of the" whys" of anxiety and stress that permeate the pregnancy and postpartum in the PSF São Judas Tadeu Goiânia - GO, Brazil. This study was conducted through intensive direct observation by means of a semi structured interview.

Results

We observed the tendency of mothers to assess the care received based on the number of made appointments and tests. This fact hides possible failures in care, such as little humanization and the lack of additional information to pregnant women, which should be improved. For this humanization both pregnant and postpartum women as professionals need

to work with confidence, comprising not only the objective aspects of care. It is valid to point out that the lack of trust in professionals was one of the main complaints of the mothers.

Conclusions

We note that it is extremely important the humanization and payment of services rendered to pregnant and postpartum women. The improvement of care reduces anxiety, reflecting the health of the mother and her baby. The patient should be monitored holistically, attending to their physical and psycho-social conditions.

An intensification in the discussions between all professionals that work in different units is necessary and the mothers who attend there, raising the negative and positive points found by each in order to promote a payment of several problems, seeking in this way a solution more viable and effective.

how pregnancy effects women's biopsychosocial health?

Ferhat Ekinci¹, Bilge Turgut², Naciye Irmak², Doğukan Ali Angın⁴, Tevfik Yoldemir³, Arzu Uzuner²

¹Department of Public Health Directory, Van

²Department of Family Medicine, Marmara University, Istanbul, Turkey

³Department of Obstetric and Gynecology, Marmara University, Istanbul, Turkey

⁴Department of Obstetrics and Gynecology, Bigadiç Community Hospital, Balıkesir

AIM: Pregnancy is an important event for women. In our study we tried to determine biopsychosocial approach in pregnant women.

METHOD: The patients who applied to the Marmara University Department of Obstetric and Gynecology outpatients clinics were recruited in this study. During the interview participants have been asked to fill Beck depression scale, Hamilton anxiety scale, Los Angeles Loneliness scale and Multidimensional Scale of Perceived Social Support- MSPSS.

RESULTS: Two hundred fifty participants were full filled the scales. Of them mean age were 28,2±4,8. The mean of marriage year is 5,9 (1-22). Pregnancy week average was 31,4±4,8. Of them 84,8% were not working and 10,8 % were smoking. Of them 35,6% were the first pregnancy. According to Beck scale 12% of them have high risk for depression and referred to psychiatry clinics. Hamilton anxiety scale score high for 57,6% participants. The loneliness scale scores were increased with increasing Beck and Hamilton scale scores ($r:0,350 - p<0,001$; $r:0,173 - p<0,006$). Living with husbands family have significantly higher anxiety scores then living just with husbands. With increasing pregnancy week; there is no correlation with loneliness and social support scale scores ($p>0,05$).

DISCUSSION: Pregnancy is a life event which mostly ended with a newborn family member. Pregnancy is a special period for every women. High anxiety scores were detected in pregnancy. Not only in obstetric clinics but also in every clinics pregnant women should examine according to biopsychosocial approach.

The effects of a structured education module on exclusive breastfeeding

Naciye Irmak, Arzu Uzuner, Burcu Başaran, Merve Telliöđlu, Sevim Aksoy, Serap Çifçili
Marmara univercity family medicine department, Istanbul, Turkey

BACKGROUND: “Exclusive Breastfeeding” (EBF) means that the infant receives only breastmilk during the first 6 months of life and is supported by the WHO

AIM: The purpose of this study, was to determine the effects of an antenatal and postnatal breastfeeding education module on EBF duration.

MATERIAL-METHODS: The participants of the study were pregnant women registered to a total of four family health centers selected based on their geographical accessibility. Pregnant women of one center formed the control group while others formed the intervention one. All of them were certified as “Baby Friendly” by the “Initiative” of Turkish Ministry of Health. The education module has been run in the university hospital Family Medicine department. Phone calls have been made on the second week after delivery to learn if any nipple problem had occurred. The mothers of the intervention group have been randomized into two groups to determine one group for reminder call and the other for routine follow up. All the participants including control group were called at the end of the postpartum 6th month to determine the rates of EBF.

RESULTS: A total of 132 mothers, 82 in intervention group and 50 in the control group were included in study. Statistically significant increase in the rates of EBF at the end of 6 months showed the effectiveness of the education module (%42,9 vs, %22,2, $p=0,001$). Early weaning rates were higher in the control group. ($18,5\pm 8,5$ vs, $15\pm 9,5$ week, $p=0,03$). The main reason of early weaning that reported by the mothers was “the insufficiency of the mother’s milk”. EBF were significantly associated with higher family income, previous positive breastfeeding experience, planned pregnancy, earlier discharge after delivery and high education level of the father. Bottlefeeding was the only independent factor that affected breastfeeding negatively. Fourth month recalls did not changed EBF rates.

CONCLUSION: Antenatal breastfeeding group educations can be an effective method to facilitate rather work in primary care.

Postpartum smoking behaviors and associated factors of mothers with 6-18 months old children

Sabire Ilke Ekim Yardım, Gamze Akyol, Tuğba Onat, Candan Kendir Çopurlar, Tolga Günvar, Dilek Güldal
Department of Family Medicine, Dokuz Eylül University, Izmir, Turkey

BACKGROUND&AIM

Smoking is still one of the biggest public health problems worldwide. Pregnancy is an important opportunity for quitting smoking. But smoking cessation during pregnancy has been recognized as a 'suspended' behavior because of the high postpartum relapse rates. The aim of our study is to investigate factors affecting smoking behaviors of women who have children 6-18 months age.

METHOD

Participants were mothers of children 6-18 months of age admitted to Dokuz Eylül University Pediatric Clinics. A questionnaire composed of demographic data and two scales of "self-efficacy" and "health locus of control". There were 288 participants. Data were analyzed by SPSS.15.

RESULTS

The mean age of participants was 30.28 ± 4.89 years. 157 participants smoke at least 1 cigarette during their lives and their husbands also more likely to smoke ($p=0.012$). 68.5% of the mothers whose husbands were smoking also were smoking before their pregnancy ($p=0.001$)

Among the 130 mothers who were smoking before their pregnancies 94 of them (72.3%) quit smoking as a result of their pregnancy. The main reason to quit smoking is the concerns about baby's health. After the birth of the child, eventually 56 of them (59.6%) started to smoke again. The main reason to start smoking is stress either about baby or life issues. Babies of the participants who returned smoking is significantly older than the babies of mothers who did not start smoking again ($p=0.011$).

Although educational status seemed to be an important factor to decide stop smoking during pregnancy ($p=0.001$) it is not related with the relapse of smoking.

Smoking behavior showed no association with self – efficacy and health locus of control scales.

CONCLUSION

Stress is an important factor for smoking relapse in mothers who quit during their pregnancies. Mothers tend to return smoking behavior as their babies grow.

Keywords: postpartum smoking, women, smoking behavior, smoking relapse,

Parental Beliefs and Practices Regarding Childhood Fever in Turkish Primary Care: A Multicenter Study

Erdoğan Yavuz¹, Erol Yayla², Saide Eda Cebeci³, Emrah Kırımlı⁴, Raziye Şule Gümüştakım⁵, Lütfullah Çakır⁶, Selami Doğan⁷

⁶Yenimahalle Family Healthcare Center, Ordu

⁷Bayraklı 4th Family Healthcare Center, İzmir

BACKGROUND: Fever is a very common problem in pediatric age and one of the most common reasons parents seek medical attention. However, in most of these visits nothing harmful is diagnosed. The literature indicates that parents demonstrated substantial fear of consequent body damage from fever if left untreated. We aimed to investigate beliefs, habits and concerns of Turkish parents regarding their children's fever.

METHODS: We performed a cross-sectional survey which was conducted as interviews in person by family physicians from April 2014 through June 2014 in family healthcare centers in nine different cities of Turkey. Parents with a child with fever aged between 0-14 years consecutively were interviewed by use of a questionnaire which consisted of 33 questions. The participants were asked questions about socio-demographic data, antipyretics and other interventions used to reduce fever before presenting to primary care center. Parental beliefs and practices concerning fever were also inquired.

RESULTS: A total of 205 parents participated in this study. During medical examination, forty-seven children (23%) had $>38^{\circ}\text{C}$ fever. Ninety-four parents (45.8%) measured fever with a thermometer prior to presentation. Only thirty-six parents (38%) used the thermometer correctly. Thirty-eight parents (18.5%) knew the correct temperature definition of fever for the measured site. A mercury-in-glass thermometer was the choice for most parents (78%) and preferred site was axillary region (85%). The fever was treated prior to arrival by 171 parents (83.4%). Paracetamol was the most frequently used antipyretic. Fifty-four parents (31.5%) failed to administer the correct antipyretic dose and seventy-three parents (42.6%) failed to give the antipyretics at proper intervals. One hundred and fifty-three parents (67%) believed that if not treated fever could cause convulsions.

CONCLUSION: We conclude that Turkish parents should be adequately educated regarding their conceptions and practices of their children's fever.

²Sisli Hamidiye Etfal Research and Training Hospital, Pediatric Pulmonary, Istanbul, Turkey

³Sisli Hamidiye Etfal Research and Training Hospital, Pediatric Gastroenterology, Istanbul, Turkey

OBJECTIVE: Increased incidence of atopy and asthma has been reported in autoimmune disease such as celiac diseases and inflammatory bowel disease (IBD). In this study we aimed to investigate the frequency of asthma and allergic disease in IBD compared to celiac disease.

MATERIAL-METHODS: The validated isaac questionnaire in Turkish was obtained from patients with celiac disease and IBD.

RESULTS: A total of 73 patients (20 with IBD and 53 with celiac disease) were involved. 52 % of patients were female and the mean age was 12.7±3.4 years. The prevalence of wheeze was 16 % at any time (15 % in IBD and 17 % in celiac disease), and 14 % for the last 12 months (10% IBD, 17 % celiac disease). The prevalence of allergic rhinitis was 35% at any time (40% in IBD and 30.2 % in celiac disease).

CONCLUSION: The frequency of asthma and allergic disease were similar in both children with IBD and celiac disease. Assessment in large number of patients is ongoing to determine the prevalence of asthma and allergic disease in patients with IBD compared to celiac disease.

⁵Dr.Lütfi Kırdar Kartal Education and Training Hospital, Urology Clinic, İstanbul, Turkey

⁶İstanbul Bilim University, Medicine School, Pediatric Surgery Department, İstanbul, Turkey

Introduction and AIM: A hydrocele is an accumulation of fluid in the tunica vaginalis. One to 2 % of male neonates have a hydrocele. This study is planned to find incidence rate of hydrocele in term neonates.

MATERIAL-METHOD: This cross-sectional study was conducted with 3422 term male newborns in a Training and Research Hospital between 2001-2005 years. Urogenital examination of the babies was held by a physician experienced in this regard within the first 24 hours. Suspected cases were confirmed by ultrasonographic examination. Hydrocele cases were reevaluated one week later. Ongoing cases of hydrocele were sent to urology polyclinic. Follow-up of cases was carried out by this clinic or pediatric surgery.

RESULTS: 275 from 3422 newborn babies (8.0%) was found hydrocele. 181 of 275 patients diagnosed with bilateral hydrocele (65.8 %), 65 on the right (23.6 %) and 29 on the left (10.5%) hydrocele were detected. In 2001 incidence rate of hydrocele was 7.58 %, in 2002 it was 15.6 %, in 2003, 2004, 2005 it was calculated as 6.66 %, 7.29 %, 2.51 % respectively. Additional urogenital anomalies were detected in 13 patients (4.72 %). Only 3 patients had bilateral (23%) and 10 patients (77%) had one-sided hydrocele. Overall, 4 patients (30.7 %) had hypospadias, 9 (69.2%) had undescended testis. With one-sided hydrocele patients to be seen by the opposite side of the unilateral undescended testis cases was an interesting finding. Six of nine hydrocele cases had left undescended testis in opposite side and hypospadias in three.

CONCLUSIONS: Neonatal hydrocele cases were found higher frequency than expected. The majority of babies had bilateral hydrocele. Obliteration occurred more frequently on the right than on the left.

OP-070

Vitamin D deficiency was common in all patients at a Swedish primary care centre, but more so in patients born outside of Sweden

Sahar Sami Ayoob¹, Lennart Mossberg¹, Anna Nixon Andreasson²

¹Fornhojden health care center, Sodertalje- Sweden

²Division for Family Medicine, Karolinska Institutet, Huddinge, Sweden

BACKGROUND: The importance of vitamin D for different processes has been highlighted in the last decade after the discovery of the extra-skeletal vitamin D-receptor. Vitamin D deficiency might be a contributing cause for the increased risk for certain chronic diseases such as diabetes, cardiovascular disease, psychological diseases, immune dysfunction and increased risk for colorectal-, prostate-, and lung cancer. Due to differences in skin tones, types of food consumed and clothing, patients with a foreign background may have a higher risk of vitamin D deficiency.

AIM: To measure vitamin D levels in an unselected primary care population at a primary care center with a high proportion of patients who are born outside Sweden and to investigate the prevalence of vitamin D deficiency in patients at the primary care center and if the vitamin D levels differ between patients born in Sweden and patients born outside Sweden.

METHODS: Vitamin D levels were assessed in all patients aged 20 to 65 years visiting the primary care center, independent of cause of visit, for two weeks in January 2014. The difference between patients born in Sweden and patients born outside Sweden were calculated using logistic regression adjusting for gender and age.

RESULTS: Patients born outside Sweden had a statistically significant lower levels of vitamin D (mean 30nmol/L; SD16.8) than patients born in Sweden (mean 43nmol/L; SD 12.9SD, $p < 0,001$). Vitamin D deficiency was more common in patients born outside Sweden than in patients born in Sweden (63% vs 17%, $p < 0,001$).

CONCLUSION: Vitamin D deficiency was more common in patients born outside Sweden than patients born in Sweden. However, vitamin D deficiency and insufficient vitamin D-levels were common at the primary care center overall. Future studies are needed to investigate if the differences in vitamin D levels between patients born in Sweden and patients born outside Sweden are exacerbated during the summer.

OP-071

Migraine headache among primary school children in a big city

Fatih Çiftçi, Hakan Demirci, Beyza Demirbaş, Ali Candar, Mehtap Gömleksiz

Department of Family Medicine, Sevket Yilmaz Training and Research Hospital, Bursa, Turkey

Background

Students living at the city center routinely have high degree of stress which is associated with migraine. We aimed to compare the frequencies of migraine in rural and urban part of the city.

Methods

This is cross-sectional, questionnaire-based study. Participants who had two or more headaches in the last 3 months were subjected to two preliminary questions and participants with at least one positive response were asked to perform the validated Identification of Migraine (ID Migraine™) test.

Results

A total of 418 primary school students were participated in the study. Migraine headache was suggested in 9.4% of students living at city center versus 4.6% of students living at rural area ($p < 0.000$). There were six students with migraine out of 19 students complaining from headache in rural area and there were 27 students with migraine out of 50 students suffering from headache in urban area.

Conclusion

The frequency of migraine is higher among students in urban area compared to rural area. Parents should be aware of the negative effects of living in city center on their children.

OP-072

Investigating blood hypertension in children and adolescents of a remote area

Constantinos Mihas¹, Maria Rifouna², Eleni Petropoulou², Panagiotis Andriopoulos², Andreas Katrapas¹, Aikaterini Mpahara¹, Anargiros Mariolis²

¹General Hospital-Health Centre of Kimi, Evia, Greece

²Health Centre of Areopolis, Mani, Greece

Background & AIM: It is internationally recognized that the prevalence of hypertension in younger people is higher than initially thought. In addition, it seems that it is a mark of early onset of adult hypertension. The aim of this study was to investigate this phenomenon in children and adolescents in a rural and remote area in a Mediterranean country

METHOD: The sample of our study consisted of 88 children (42 boys, 46 girls), age 8-18 years old who visited the Primary Health Care unit of Areopolis, Mani, Greece, a remote and rural area, in order to undergo a physical examination for health certificate that would be used for school purposes. All children participated to the study after the parents signed an agreement. Three blood pressure measurements were carried out; the mean values were recorded. The NHANES criteria were used for classification of hypertension (>95th percentile), adjusting for age and sex.

RESULTS: Eleven children (12.5%) were hypertensive, similarly distributed across three age categories (8-11, 12-15, 16-18). The prevalence of hypertension did not differ significantly between genders. (Boys: 9.52%, Girls: 15.22%, $p=0.420$), while it was significantly correlated with increased body weight (Prevalence in normal: 5.17%, prevalence in obese/overweight: 26.67%, $p=0.004$)

CONCLUSIONS: Although the sample of the study is not large enough, the primary results are alarming regarding the health status of children and adolescents in a rural area. The early recognition of the problem and the help of parents and the family physician might lead to lifestyle change and therefore, successful treatment of this concerning phenomenon.

Keywords: hypertension, children, remote

OP-073

Obesity in children who are transported from rural villages by bussing system

Yakup Akpınar, Hakan Demirci, Ali Candar, Fatih Çiftçi, Hayri Bozkurt

Department of family Medicine, Sevket Yılmaz Training and Research Hospital, Bursa, Turkey

PURPOSE:

Children living in villages are transported by bussing system to the nearest city center in Turkey. These children's nutritional needs are met by the state. In this study, we aimed to compare obesity between transported group and children living at the city center and fed by their families.

METHOD:

The universe of the study is the primary students aging 6-10 years in Buyukorhan district in Bursa. Height is measured when the child is standing and weight is measured when the child was wearing light clothing. Body Mass Index (BMI) was calculated as $\text{weight}/\text{height}^2$ (kg/m^2). Obesity was determined when $\text{BMI} \geq 95$ percentile.

RESULTS:

There were 107 boys and 121 girls in the study group. Number of children who transported by bussing system was 111 (group A) while 117 (group B) of the children were living in the city center. The average BMI of group A was 15.95 ± 1.59 , and the average BMI in group B was 16.72 ± 2.93 ($p = 0.016$). In total there were 16 obese children and 15 of them were composed of the children were living in the city center.

RESULT:

The prevalence of obesity in rural area in Bursa is 7%. The nutritional needs of children transported from the villages are provided by the state and obesity was quite rare in this group. Our study suggests that programmed healthy diet may protect children from obesity.

Keywords: obesity, children, bussing system, rural

OP-074

The prevalence of developmental delay among children aged 3-60 months in Izmir city center

Aylin Demirci, Mehtap Kartal

Department of Family Medicine, Dokuz Eylul University, Izmir, Turkey

Developmental delay is defined as delays in speech and language development, motor development, social-emotional development, and cognitive development. Worldwide, the prevalence estimations in pediatric population ranges between 5% and 15%. But in Turkey, there is no prevalence studies in primary care on developmental delay. The aim of this study was to determine the prevalence of developmental delay among children aged 3-60 months in Izmir.

A cross-sectional, descriptive research included 1514 children aged 3-60 months, who were at the 12 family health centers (FHC) for any reason in Izmir between November 1, 2013 and January 31, 2014. The questionnaire and age-specific ASQ-TR (Ages and Stages Questionnaire Turkish version) was administered in a face to face interviews by the researcher to the mothers.

The prevalence of developmental delay determined by ASQ-TR was 6.4% (95% CI 5.2-7.7). The prevalence for age groups changed between 3.3 and 12.1%. Significant relationship was found between developmental delay and maternal age, maternal-paternal education, socioeconomic status, comorbidities of mothers, diseases during pregnancy, types of birth and birth weights of children, postnatal diseases and duration of breastfeeding.

Identifying developmental delay in children earlier by administering a validated, reliable, parent-completed questionnaire as ASQ-TR and detecting risk factors for delay are crucial for primary care where their growth and development is monitored. By identifying developmental delay and referring to rehabilitation services earlier may help to improve their quality of life.

Keywords: Developmental delay, prevalence, ASQ, primary care

OP-075

Prevalence of Overweight and Obesity Among Turkish 6-15 Years Old School Children

Demet Merder Coşkun¹, Arzu Uzuner¹, Fatma Dindar¹, Hüseyin Akgün², Mücahit Eroğlu², Fırat Öz², Aziz Kaan Türkoğlu²

¹Marmara University Medical Faculty Department of Family Medicine

²Marmara University Medical Faculty

BACKGROUND: Childhood obesity is one of the most important community health problems which Family Physician to manage. The aim of this study is to assess the current prevalence of overweight and obesity among 6-15 years old school children in the province Istanbul Pendik district in Turkey.

METHOD: This is a descriptive, cross-sectional community-based study. Study was conducted in the 2013-2014 school year. A representative sample of 6-15 years old school children in the province Istanbul Pendik district was selected from the public schools by randomisation. Inclusion criteria was signed informed consent by parent, given date of birth data and presence in the school on the date of anthropometric measurements (including weight, height, waist circumference and mid-upper arm circumference) were done by researchers. The body mass index (BMI) was used as a measure of overweight and obesity in the children. Age-gender specific BMI z-score cutoff points of WHO-MGRS(2007) was used to determine the presence of overweight and obesity. According to the z-score $\geq 1SD$ - $<2SD$ was recognised as "overweight" and $\geq 2SD$ was recognised as "obesity".

RESULTS: Data of the 4246 participants was analyzed; 2135 (50.3%) were male and 2111 (49.7%) were female. Average age was 10.5 ± 2.4 . Prevalence of overweight was 23.4% (M=23.1%, F=23.7%) and obesity was 13.7% (M=15.6%, F=11.7%) respectively. The highest overweight rate was assessed in the age of 13 (26,7%) and the highest obesity rate was assessed in the age of 10 (18.8%) within age groups.

CONCLUSION: Our study showed that overweight and obesity is a serious problem with its high prevalence and comparing with the literature it can be seen that obesity prevalence among Turkish children is tend to increase through years. There is need for further community-based interventions and health policy against the increasing trend of obesity in Turkey.

OP-076

Cost of pediatric allergic rhinitis and its complications in Turkey

Ergün Öksüz¹, Simten Malhan², Bilge Sönmez³, Rukiye Numanoğlu²

¹Başkent University, Department Of Family Medicine, Faculty Of Medicine, Ankara, Turkey

²Başkent University, Faculty of Health Sciences, Ankara, Turkey

³Cerkes State Hospital Family Medicine, Cankırı, Turkey

Introduction

Sixty percent of rhinitis cases are allergic rhinitis (AR). AR affects up to 20% of adults and 40% of children. The prevalence of AR is 8.3% in pediatric age group in Turkey. The cost of treatment increases related to severity of the disease and comorbid conditions.

Purpose

The purpose of this study is to evaluate the cost of treatment of AR in the pediatric age group.

Methods

The "Cost of Illness" methodology developed by the World Health Organization was used in the calculation of cost of allergic rhinitis. The calculation based on average cost per patient annually from the perspective of payer (SSI). Costs of all medical services were calculated with Healthcare Applications Bulletin (HAB) of February 18, 2015 according to HAB Appendices 2B and 2C. Costs were converted to purchasing power parity (PPP) in 2014 in US dollars (\$) (\$1 = TL1.179). A sensitivity analysis was performed by using Monte Carlo Simulation for the uncertainty modeling (N= 5,000)

Results

The cost of outpatient treatment was calculated as \$108,4, hospitalization and intervention \$101.8, drugs and other medical supplies \$115.6, complication \$430.0 respectively per patient annually. The average annual direct cost of AR per patient was found to be as \$855.6. Standard deviation of the sensitivity analysis for model was \$596.8 (95% Confidence Interval \$ 841.1 - \$ 874.2)

Conclusion

It is found that the costs of medications account for 13.5%, the costs of outpatient care account for 12.6%, and disease-related complications account for 50.3% of the total cost of allergic rhinitis in the pediatric age group. Follow up treatment which significantly reduces symptoms and medication requirements in allergic rhinitis. It also effects direct cost of illness and loss of school day positively.

Fetal growth parametres and sex importance

Joaquín Brea Aymerich¹, Blanca Ribot Serra³, Gemma March Jordi⁴, Susana Abajo Llama⁴, Francisco Josep Fargas Moreno⁴, Victoria Arijá Val², Josep Basora Gallisa²

¹Centro de Atención Primaria, Reus 4-Horts de Miro. Institut Català de la Salut.

²Unitat de Suport a la Recerca del Institut d'Atenció Primària Jordi Gol i Gurina. Institut Català de la Salut.

³Nutrición y Salud Pública. Universitat Rovira i Virgili

⁴Servicio de Atención a la Salud Sexual y Reproductiva. Institut català de la Salut

OBJECTIVE: The aim of this study was to evaluate whether there are differences between the fetal growth parameters and sex in children in our society with childbirths at term and normal weight.

METHODS: Retrospective longitudinal study in 5304 pregnant women who took her control pregnancy in primary cares Health Center, between 2007 and 2012, which had children with normal weight and term and all women had repeated ultrasound assessments to examine fetal growth.

We collected data from the ultrasound: crown-rump length (CRL), biparietal diameter (BPD), head circumference (HC), abdominal circumference (AC) and femur length (FL).

RESULTS: The boys had significantly higher means values in BPD, HC and AC than girls, mainly from the second trimester. We not found significant differences between the CRL or FL and the sex.

CONCLUSION: Healthy boys with term child births and normal weight have significantly higher mean values for BPD, HC and AC than girls. However, the differences are small and not known that may have a clinical impact and it is recommended to conduct studies to assess the clinical significance of these differences. Although these findings provide support for the use of sex-specific sonographic models as well as of sex-specific reference growth charts.

Nutritional Status, Healthy Eating Index and Eating Attitudes of the adolescents in Istanbul: A cross-sectional study

Binnur Bakır¹, Hülya Akan², Mehmet Akman³, Oğuzhan Zahmacıoğlu⁴, Osman Hayran⁵

¹Department of Nutrition and Dietetics, Faculty of Health Sciences, Yeditepe University, İstanbul, Turkey

²Department of Family Medicine, Medical Faculty, Yeditepe University, İstanbul, Turkey

³Department of Family Medicine, School of medicine, Yeditepe University, İstanbul, Turkey

⁴Department of Child and adolescence psychiatry, Medical Faculty, Yeditepe University, İstanbul, Turkey

⁵Department of Public Health, School of medicine, Medipol University, İstanbul, Turkey

Background & AIM: The aim of this study was to evaluate dietary quality of adolescents by using Healthy Eating Index (HEI) and to assess their eating attitudes by EAT-26 Eating Attitude Test.

METHODS: Eight schools; four primary schools and four secondary schools were randomly selected from the school list of official website of Istanbul Education National Directorate. 598 students who met the inclusion criteria included in the study, 24 hour dietary recalls were collected to calculate their HEI scores and eating attitudes were evaluated by EAT-26 Eating Attitude Test. Their weight, height and waist circumference were measured.

RESULTS: According to Healthy Eating Index scores, only two (0.3%) of adolescents had high quality diet, 379 (63,4%) had diet quality that needed improvement and 217 (36.3%) had poor diet. Regarding Eating Attitude Test scores, 513 (85.8%) had normal attitudes regarding eating behaviours.

CONCLUSIONS: Almost all of the participants needs either development or major changes in their eating behaviours. Interventions aiming high quality diet among adolescents are strongly recommended.

OP-079

Bronchiolitis Frequency And Factors Those Trigger Bronchiolitis Among Children Aged 0-14 years

Demet Yılmaz¹, Ilknur Demir¹, Dilek Toprak¹, Ibrahim Hakki Aktan²

¹Department of Family Medicine, Sisli Hamidiye Etfal Training And Research Hospital, Istanbul, Turkey

²Department of Pediatrics, Sisli Hamidiye Etfal Training And Research Hospital, Istanbul, Turkey

AIM:

In this study, we aimed to evaluate bronchiolitis frequency and factors those trigger bronchiolitis in children aged 0-14 years.

METHODS:

In this cross-sectional, descriptive study a questionnaire was performed to the parents of children aged 0-14 years who applied to Istanbul Sisli Hamidiye Etfal Training and Research Hospital Pediatric Polyclinics between December 2014 and March 2015. After recording sociodemographic features of the subjects the frequency of bronchiolitis, family history of bronchiolitis, asthma, history of allergic bronchitis, heating type of the house, hospitalization history because of bronchiolitis, mother's smoking status at home during pregnancy were evaluated. Data was assessed using Chi-square, T Test and frequency analysis in SPSS v20.0.

RESULTS:

Totally 100 children included the study whose mean age was $4,22 \pm 3,49$. Of the study group 49% (n=49) were girls and 51% (n=51) were boys. While 58% of our patients (n=58) had history of bronchiolitis, family history of asthma was present in 53% of them. In siblings of 38% children bronchiolitis, asthma or allergic bronchitis were present. While children who had bronchiolitis had a history of 43.1% sibling bronchiolitis history this relationship was not statistically significant ($p=0.217$). There was a significant relation between bronchiolitis and gender ($p=0.023$) as it was more prevalent in boys. Of children who had bronchiolitis had 58.6% family history of asthma, 43.1% history of smoking in the house. However no relationship was found between smoking at home, family history of asthma, heating type of the house and bronchiolitis in children ($p=0.186$, $p=0.249$, $p=0.324$ respectively).

CONCLUSION:

In our study, it was observed that most of the children had bronchiolitis. Although bronchiolitis is a multifactorial disease, in other studies it was carried out that smoking, family history and heating type of the house are risk factors. We believe that the researches with larger groups will highlight this relationship.

Individualized treatment targets in type 2 diabetes patients: the Dutch approach

Huberta Hart¹, Anne Meike Boels², Rimke Vos², Guy Rutten²

¹Leidsche Rijn Julius Health Centers, Utrecht, The Netherlands

²Julius Center for Health Sciences and Primary Care, University Medical Center Utrecht, The Netherlands

Background and AIM: In different healthcare settings, the proportion of patients who achieve adequate cardiometabolic control is < 25%. We compared the proportion of cardiometabolic well-controlled type 2 diabetes mellitus (T2DM) patients according to a clearly defined, simple individualized approach as recommended in the Dutch guidelines versus the one-size-fits all approach, and investigated which factors are associated with good cardiometabolic control.

METHODS: Observational study, using routine data from electronic medical records of primary care T2DM patients. Data of the individualized (see below) and the one-size-fits-all approach (HbA1c ≤7% (53 mmol/mol), SBP ≤140 mmHg and LDL ≤2.5 mmol/l) were compared. Ordinal regression analysis was performed to determine which factors were associated with good cardiometabolic control.

RESULTS: Of the 890 patients (54.7% male, mean age 62.7 years), 31.8% were well-controlled according to the individualized approach, compared to 24.8% according to the one-size-fits-all approach. For patients aged ≥70 years, using more than metformin alone, a 27.3% increase for reaching the HbA1c target was observed. In patients ≥80 years 45.6% more of them achieved their SBP target of ≤160 mmHg. An LDL ≤2.5 mmol/l was achieved by 62.7% of the patients, with a 5.2% increase according to the individualized approach (67.9%). A higher BMI (odds ratio (OR) 0.97, 95% CI 0.95-0.99), insulin use (OR 0.45, 95% CI 0.33-0.62), and care avoidance (OR 0.17, 95% CI 0.05-0.55) were associated with a lower chance of reaching all treatment targets, the use of lipid-lowering medication (OR 1.39, 95% CI 1.04-1.85) increased that chance.

CONCLUSION: A clearly defined and relatively simple individualized approach might increase the percentage of patients with an overall good cardiometabolic control. Especially elderly patients may benefit from the individualized approach.

Keywords: type 2 diabetes, cardiometabolic control, individualized targets

Prevalence of asymptomatic hypertension: A multicenter family practitioners' research

Hakan Demirci, Yakup Akpınar, Ali Candar

Department of family Medicine, Sevket Yılmaz Training and Research Hospital, Bursa, Turkey

AIM:

Hypertension is a well-known risk factor for cardiovascular disease. Effective management of high blood pressure is possible when the magnitude of the problem is documented. In the present study we aimed to investigate the prevalence of asymptomatic hypertension in Bursa.

METHOD:

One thousand thirteen subjects aged ≥20 years were randomly selected to estimate the prevalence of asymptomatic hypertension. Twenty family doctors participated in the study. Socio-demographic data was collected by personal interviews and blood pressure measurements were performed.

RESULTS:

The prevalence of hypertension was 25.8 % (n=261), of the total prevalence 71 % (n=186) were known cases, and 29 % (n=75) were newly detected cases. Sixty seven of the asymptomatic hypertension cases were stage 1, seven cases were stage 2, and only one case was stage 3. Based on the seventh report of the Joint National Committee (JNC VII) on high blood pressure, pre-hypertension was noted in 15.7 % (n=159) of the total.

DISCUSSION:

Prevalence of asymptomatic hypertension is 7.4%. Family doctors should periodically measure blood pressure because there are lots of persons with hidden hypertension.

Keywords: asymptomatic hypertension, family medicine, prevalence

OP-082

Vision screening for school-age children: an opportunity for early detection

Yusuf Haydar Ertekin¹, Murat Tekin¹, Aysegul Uludag¹, Sibel Cevizci², Erkan Melih Sahin¹

¹Department of Family Medicine, Canakkale Onsekiz Mart University, Canakkale, Turkey

²Department of Public Health, Canakkale Onsekiz Mart University, Canakkale, Turkey

Background & AIM:

Pediatric vision screening is planned to detect children with vision disorders which are amblyopia, strabismus, visual acuity and color blindness. Without early identify and control, children's vision disorders can lead to permanent vision loss and teaching difficulties. A common approach to early identifying and controlling of vision disorders in school children is vision screening by pediatricians or family physicians.

METHOD: This cross-sectional and descriptive design study was carried out in the autumn of 2013. Screening was performed by family physicians using the Snellen Eye Chart, and Ishihara and Hirschberg tests after a detailed preliminary training. The screening was conducted to identify visual acuity (VA), colour blindness (CB), amblyopia (AMB) and strabismus (STR).

RESULTS: The study involved 945 female and 1,004 male participants (total 1,949) with an average age of 8.9 for females and 9 for males, and 9 overall. The total prevalence of the screened ocular pathology was found to be 14.4 percent, while VA was detected to have a prevalence of 8.8 percent, CB 4.6 percent, AMB 5.6 percent and STR 2.3 percent, in order of frequency.

The regression analysis revealed three times the STR risk in premature and post mature children; while the risk of AMB was 345 times higher in people with VA and 6.8 times higher in people with STR. The risk of CB was found to be 2.3 times higher among those who had had a caesarean birth.

CONCLUSIONS: The USPSTF recommends vision screening for all children at least once preschool children to identify the presence of amblyopia or its risk factors. The results of our screening of school-age children lead us to the opinion that the preschool screening program is not sufficient, or that screening should be repeated at school age.

⁵Almansa Health Centre, Health Care Service of Castilla-La Mancha, C/San Juan s/n, 02640 Almansa, Albacete, Spain

⁶Cuenca Faculty of Nursing, University of Castilla-La Mancha, C/Camino de Pozuelo s/n, 16071 Cuenca, Spain

OBJECTIVE: To determine reducing depressive symptoms in patients who initiated treatment with antidepressants and analyze factors associated with treatment response.

MATERIAL AND METHOD

Design: Prospective longitudinal observational study.

Setting: Primary care of three health areas of Castilla-La Mancha.

Participants: 167 patients older than 18 who initiated antidepressant treatment.

Main measurements: intensity of depressive symptoms (validated 10-item scale Montgomery-Asberg Depression version), health status (CIAP-2 WONCA), consumed drugs, side effects, adherence (Morisky-Green) sociodemographic characteristics and other characteristics of participants.
Descriptive, bivariate regression and Cox statistical analysis.

RESULTS

The mean age was 53.4 years (SD 15.7). Through Depression Scale Montgomery-Asberg an average score at study entry 21.5 (9.3 SD) and 8.4 (SD: 8.1) at 6 months was observed. The proportion of patients who responded to treatment (50% reduction of the Montgomery-Asberg score) was 34.7% (95% CI 27.9 to 42.2) after six months, achieving remission (post-treatment score ≤ 9) of symptoms 28.7% (95% CI 22.4 to 36.0) of patients interviewed. By Cox analysis the variables related to the response to antidepressant treatment were the history of previous depressive disorders (HR:5,2), no previous use of antidepressants (HR:7,2), antidepressant treatment prescribed by family doctor (HR:4,1) and increased attendance at family medicine clinics (HR:1,2).

CONCLUSIONS

One third of patients treated with antidepressants responded to them after 6 months and more than a quarter showed remission of depressive symptoms. It was found that the variables related to the response to antidepressant treatment are the previous disease, history of previous antidepressant treatment, the doctor who prescribed and attendance.

Dietary compliance and awareness of primary care patients with dyslipidemia

Katarzyna Nessler, Anna Krztoń Królewiecka, Joanna Kwaśniak, Dominika Drwiła, Monika Pyzio, Sylwia Kopeć, Andre Brais, Adam Windak
Department of Family Medicine, Jagiellonian University, Krakow, Poland

BACKGROUND AND AIM:

Dyslipidemia is a metabolic disorder that affects many people worldwide and increases the risk of cardio-vascular disease and other serious clinical disorders. Appropriate, low-fat diet and increased physical activity are essential parts of prevention and treatment of dyslipidemia. The aim of our study was to assess awareness and compliance of proper diet among primary-care patients' suffering from dyslipidemia.

METHOD:

A cross-sectional survey with the use of an anonymous validated questionnaire was performed in 4 GP offices in Krakow from January to February 2015. The essential part of the questionnaire explored patients' diet patterns. Data on socio-demographic characteristics of the participants was also collected.

RESULTS:

The field workers asked 200 PHC patients over the age of 40 to take part in the survey, of whom 178 agreed to participate (response rate: 89%). The mean age of the respondents was 61.94 (SD=12.24), 69% of them were females. 56% of respondents were diagnosed with lipid disorders requiring dietary changes and 43% requiring medications. 74% of patients declared that they changed diet after being diagnosed with dyslipidemia. GP consulted the diet change with 72% of patients diagnosed with lipid disorders. Interestingly, healthier diet patterns were found among females and patients who prepare the meals themselves. The diet pattern did not correlate with the fact of receiving a diet advice from a GP or with the use of lipid-lowering drugs. Respondents diagnosed with dyslipidemia eat more servings of fruits than patients without these disorders ($p = 0.012$). The presence of lipid disorders did not correlate with the other elements of the diet.

CONCLUSIONS:

Despite the fact that patients believe they have changed the diet patterns after being diagnosed with

dyslipidemia - they are not on a proper diet. There is a need for research into effective forms of education for patients.

¹⁰San Clemente Health Centre, Health Care Service of Castilla-La Mancha, C/Ancha s/n, 16600 San Clemente, Cuenca, Spain

OBJECTIVE

To describe cardiovascular risk factors and clinical characteristics of patients diagnosed with hypercholesterolemia and to determine their cardiovascular risk and comorbidity.

MATERIAL AND METHOD

Cross-sectional multicenter study will be conducted at facilities of ten health centres in three of Spain's Autonomous Regions (Comunidades Autónomas). 358 adult subjects diagnosed with hypercholesterolemia and selected by consecutive sampling were evaluated. Sociodemographic variables, cardiovascular risk factors, lipid profile, cardiovascular risk (Score and Regicor), health problems (CIAP-2 classification), drug consumption and comorbidity were collected by the Charlson index.

RESULTS

The mean age was 58.6 years (SD: 9.8). 50.6% were hypertensive, 23.2% smoker, 17.6% and 41.6% obese diabetic. 29.6% had metabolic syndrome. 54.5% had a cardiovascular problem. 36.6% had 3 or more health problems. 29.4% had a high or very high cardiovascular risk (Score ≥ 5) and 27.9% Charlson index ≥ 3 . Comorbidity presented a statistically significant positive correlation with respect to the score ($r = 0.537$; $p < 0.001$) and Regicor ($r = 0.352$, $p < 0.001$). By multiple linear regression, the variables associated with greater comorbidity index were: age, use of more drugs, higher score index, more diseases, present a circulatory problem, endocrine, respiratory or genital.

CONCLUSIONS

More than half of the patients with hypercholesterolemia present a cardiovascular problem and about one third a high or very high cardiovascular risk. More than one third had 3 or more diseases. It has been found that in addition to the variables considered in calculating the comorbidity using the Charlson index, there are others that may be related to comorbidity in hypercholesterolemic subjects such as Score index, the presence of a circulatory problem, endocrine, genital or respiratory and the number of drugs consumed or diseases that have been presented.

OP-086

Missionary work and health care provided by family physicians in late Ottoman and early Turkish period

Mumtaz M Mazicioğlu

Erciyes University Faculty of Medicine

BACKGROUND: Ottoman existence in Anatolia starts from 1288 by the successors of Seljuks and extended to Vienna until 1683. In the last period of Ottoman Empire in the; Europe, Balkan, Anatolia and the middle east parts of the empire there had been an intensive and extensive missionary activity which was led by education and health. Family physicians from United States of America moved to several parts of Ottoman Empire where they gave effective and altruistic health care in several facilities constructed by themselves. In 1914 there were 24 stations, 308 outstations, 209 missionaries, 1299 native laborers, 450 schools, 9 hospitals, 10 dispensaries which accounts the %25 of work done in whole world by American Board of Commissioners in foreign Missions.

METHODS: The medical work done in several hospitals belonged to different missions and family physicians who gave both in- and outpatient health care will be described in this presentation.

RESULTS: The work done by Dr Shephard (Figure 1) in Gaziantep/Turkey will be summarized as a template of the role of family physicians for non-muslim and muslim citizens of Ottoman Empire. Azariah Smith is the first physician East part of Ottoman Empire who arrived in 1842. In 1880 a medical school was founded with three lecturers and 12 students. Fred Douglas Shepard becomes the director from 1882 to 1914. Before his set-up in Gaziantep he takes a course for oral health with his wife also. At his first glance in Gaziantep he observes that osteopaths and fitotherapists were the two groups who serves in primary health care and there were no others.

CONCLUSIONS: Since the first school of medicine were founded in Ottoman empire in 1827 Gaziantep medical may be regarded as the first civil facility of medical education. Primary health care provided by this facility is still going on.

OP-087

Abdominal obesity and incidence of cardiovascular events. A retrospective cohorts study

Juan Ignacio Sáenz¹, Fernando Javier Elias¹, Nino Abuladze¹, Inma Sánchez²

¹Palafrugell Primary Care Center. Palafrugell, Girona. Spain

²Research Department. Hospital of Palamos. Palamos, Girona. Spain

BACKGROUND & AIM

The objective was to analyze the association between abdominal obesity and the incidence of cardiovascular events in a Primary Care setting during five years.

DESIGN: Retrospective cohorts study. Four Primary Care Centers. Time period of analysis from 2008 to 2012. Selection criteria: both genders in the age range of 35 - 74 with no cardiovascular disease in 2007. Variables: abdominal perimeter (AP) in centimeters in the year 2007. Number of cardiovascular events between 2008 and 2012. Considering: myocardial infarction, angina, stroke, TIA, aortic dissecting aneurysm, peripheral arterial ischemia. Other: Age, gender, BMI, smoking, diabetes mellitus, hypertension, total cholesterol, HDL, proteinuria and sedentary lifestyle in 2007. Statistical analysis: proportion comparison, relative risk (RR), confidence interval of 95%. Limitations: Low AP documentation during the year 2007.

RESULTS: Assigned population: 93,000 people. People included in the study: 36,503. Women: 18,314 (50,2%). Men: 18,189 (49,8%). Average age: 49 years old (9,9). 1008 cardiovascular events in 5 years. Incidence: 2,8 cases per 100 people in 5 years. By gender: 3,8 cases per 100 men in 5 years (0,76 per year) and 1,8 cases per 100 women in 5 years (0,36 per year). For abdominal obesity 7311 people have been included. The RR is 0,94 (CI95: 0,76 – 1,15)

CONCLUSION: The incidence of cardiovascular events in this study is lower to the rate registered in Spain during the year 2004, which is of 1,40 cases per 100 men / year and 1,22 cases per 100 women/ year. The study did not find an association between abdominal obesity and incidence of cardiovascular events. We consider it desirable to increase the documentation of abdominal perimeter.

Early and menopausal weight gain, and their relations with diabetes and hypertension International study on lifelong weight gain and manifestation of metabolic diseases

Imre Rurik¹, Csaba Móczár², Nicola Buono³, Iveta Vaverkova⁴, Pavlo Kolesnyk⁵, Thomas Frese⁶, Jarmila Mahlmeister⁶, Ferdinando Petrazuoli⁷, Enzo Pirota³, Tímea Ungvári¹, Zoltán Jancsó¹, Imre Rurik⁸

⁶Department of General Practice, University of Leipzig, Leipzig, Germany

⁷Department of Clinical Sciences, Centre for Primary Health Care Research, Lund University, Malmö, Sweden

⁸EGPRN (European General Practice Research Network, Maastricht, The Netherlands)

Background

Previous research found relations between weight gain and metabolic diseases developed later. These studies covered only short periods, not longer than 4-8 years.

We aimed collecting decades long, often life-long anthropometric data for better comparison of this relation.

Methods

A retrospective international study was planned and organized to compare data of self-recorded lifelong weight

gain of persons between 60y-70y, to analyze its correlation with developed metabolic diseases, with special attention to women's weight gain around pregnancy, delivery and menopause within primary care settings in Germany, Hungary, Italy, Slovakia and Ukraine.

Results and discussion

There were 815 participants recruited, and 286 men/447 women of them presented completely all the required data. The weight and BMI of the whole study population increased till their seventies, less after their fifties. Changes over decades were higher among patients with hypertension than within "healthy" group. Weight increase in the first decades (20-30y by men, 30-40y by women) was a significant risk factor for the development of diabetes (OR=1.49; p =0.017;95%;CI:1.07-2.08). Significantly higher weight gains were recorded in the last decade before diabetes has been diagnosed. Among patients with diabetes and hypertension, both diagnoses were set up earlier, than by patients with one morbidity.

By females, weight increases around delivery and menopause correlated significantly with higher odds for the diagnoses of diabetes and/or hypertension, without significant correlations with the numbers of children.

Conclusions

Primary care physicians during their decade-long contact with their patients are expected to identify the weight gain of the patients still in their early decades and provide intervention, if necessary.

Evaluation of cooccurrence prevalence of depressive symptoms and metabolic syndrome in patients applied Dokuz Eylul University Faculty of Medicine, Family Medicine department outpatient clinic

Ilyas Erken¹, Nilgün Özçakar²

¹ilyas erken

²nilgün özçakar

OBJECTIVE: Our aim is to evaluate the prevalence and cooccurrence of metabolic syndrome according to different guidelines and depressive symptoms in outpatient clinic of family medicine department to contribute the diagnosis and treatment period.

METHODS: Our cross-sectional study performed with informed participants applied Dokuz Eylul University Faculty of Medicine Family Medicine Department outpatient clinic in between 01.12.2013-01.04.2014. Questionnaire about demographical variables and Beck Depression Inventory scale used and performed by investigator with face to face interview. We diagnose metabolic syndrome according to The Society of Endocrinology and Metabolism of Turkey, National Cholesterol Education Programme ATP III and International Diabetes Federation guidelines. Data evaluated with SPSS 15.0 package program, p<0.05 is accepted statistically significant.

RESULTS: Our study was performed with 247 participants. The medium age 34.98±14.90 years, 60.6% of participants were female, 87.4% of high school and upper education level. We grouped the participants according to Beck depression inventory point; 73.9% minimum, 16.6% mild, 9.3% moderate, 0% severe. Elevated Beck Depression Inventory point causes rational increase prevalence of metabolic syndrome in 2 guidelines.(p<0.05)

CONCLUSION: As the severity of depressive symptoms increases there is an increased incidence of metabolic syndrome. Monitoring patients closer who have depressive symptoms by family physicians in primary care is important in terms of components of metabolic syndrome.

Prevalence and Associated Risk Factors of Tinnitus in Adults

Sevim Aksoy Kartcı, Çiğdem Apaydın Kaya, Yeliz Özendi

Department of Family Medicine, Marmara University, Istanbul, Turkey

BACKGROUND:

Tinnitus is very common symptom in primary care and have important implications for patients' quality of life. However, tinnitus substantially underdetected and undertreated.

AIM:

The aim of this study was to analyze the prevalence and associated risk factors of tinnitus among the patients who admitted to our family medicine outpatient clinic with any symptom.

METHOD:

This is a descriptive study. The patients ≥ 18 years old and being at least literate admitted to family medicine outpatient clinic of Marmara University during 2 weeks were included to the study. The patients admitted with acute tinnitus or otological complaints were excluded. A questionnaire which includes tinnitus handicap inventory, medical history, caffeine, alcohol and tobacco consumption, global health perception scale and Beck depression inventory were used. The questionnaire and scales were filled by the patients. For the analysis chi square test, student's t-test and multiple logistic regression analysis were performed.

RESULTS:

Totally 226 of 1091 patients who admitted during the study period were participated to the study. 74% were female, 26% were male. Mean age was 41 ± 1.26 . Among the patients 43.4% have tinnitus. 20% of the patients' depression score was ≥ 17 . The univariate analysis revealed that at the 0.05 level of significance the variables otologic and sinonasal conditions, noise exposure, hearing problems, weight gain, dizziness, gastroesophageal reflux, sensation problems, insomnia, joint problems, hypertension, drinking tea ≥ 2 cup, poor health perception and having depression symptoms to be significantly associated with tinnitus. Analyzing the risk factors for tinnitus, gastroesophageal reflux (OR:0.055; CI:0.009-0.333), otologic and sinonasal conditions (OR:0.143; CI:0.024-0.863), and having depression symptoms (OR:0.036; CI:0.003-0.512) were found to be a risk factor for tinnitus.

DISCUSSION:

We found that tinnitus prevalence among the patients admitted to our clinic was higher than the literature. Further studies should be done associated with the impact of the treatment of reflux and depression on tinnitus.

Healthy Ageing Through Internet Counselling in the Elderly (HATICE): design of a randomised controlled trial

Susan Jongstra¹, Miia Kivipelto², Sandrine Andrieu³, Edo Richard¹

¹Department of Neurology, Academic Medical Center, Amsterdam, The Netherlands

²Aging Research Center and Alzheimer Disease Research Center, Karolinska Institutet, Stockholm, Sweden

³Department of Epidemiology and Public Health, Toulouse University Hospital and Inserm U1027, F-31073, Toulouse, France

Background & Aim

Cardiovascular risk factors including hypertension, hypercholesterolemia, smoking, obesity, diabetes and physical inactivity are associated with an increased risk of both cardiovascular disease (CVD) and dementia. To reduce this risk among people of 65 years and older, more accessible prevention programs would be welcomed and self-management could be a powerful tool to this end. In this study we investigate the efficacy of an innovative interactive internet platform to optimise self-management of cardiovascular risk factors in older persons to reduce cardiovascular risk and prevent cardiovascular disease and dementia.

Methods

HATICE is a multi-national, multi-centre, investigator initiated, open-label blinded endpoint (PROBE), randomised controlled trial, with 18-months intervention and follow-up. Recruitment of 4250 people aged 65 years and older with an increased cardiovascular risk will take place in Finland, France and the Netherlands. The intervention group will use an interactive internet-platform supported by a coach to improve a healthy lifestyle. The control group will get access to a platform similar in appearance but without the interactive features and support of a coach.

Outcome

The primary outcome of the study is a composite score based on the difference between baseline and 18 months follow-up values of systolic blood pressure, cholesterol and BMI. Main secondary outcomes are improvement in estimated 10-year cardiovascular disease risk based on the Framingham cardiovascular disease risk score, incident cardiovascular disease, improvement of the number of measurable risk factors (blood pressure, BMI, cholesterol, glycated haemoglobin), improvement of the number of self-reported risk factors (physical exercise, diet), mortality, disability, cognitive decline, CAIDE dementia risk-score, depression and cost-effectiveness.

Conclusion

The growing use of the Internet among older persons allows for development of innovative strategies to improve cardiovascular risk management, which can be easily implemented on a large scale if effective.

⁷Aging Research Center and Alzheimer Disease Research Center, Karolinska Institutet, Stockholm, Sweden

⁸Department of Neurology, University of Eastern Finland, Kuopio, Finland

Background and aim

E-health is expanding the possibilities for contemporary medicine. In view of the global ageing and pandemic of unhealthy lifestyles, there may be growing scope for innovative Internet-interventions that can address the increasing burden of cardiovascular risk and disease. Elderly people form an important target population because the reduction of cardiovascular risk appears effective until well beyond the age of 65. In this systematic review and meta-analysis, we aim to evaluate whether Internet-interventions to improve cardiovascular risk factor management in older persons can reduce the risk of cardiovascular disease.

Method

We systematically searched Embase, Medline, Cochrane and Cinahl from 1995 onwards for randomized controlled trials on Internet-interventions targeting cardiovascular risk factors in older populations with a mean age of at least 50 years. Outcomes regarding treatment effects on cardiovascular risk factors (blood pressure (BP), glycated haemoglobin (HbA1C), LDL-cholesterol, smoking status, weight and physical inactivity) and incident cardiovascular disease were pooled with random effects models, where possible.

Results

36 studies (12,157 participants) fulfilled eligibility criteria. 27 studies provided sufficient information to be included in the meta-analysis. In the intervention group, we found a small but significant reduction of systolic BP (-2.82 mmHg (95% CI, -3.97 to -1.67)), diastolic BP (-1.54 mmHg (95% CI, -2.23 to -0.85)), HbA1c (-0.23% (95% CI, -0.38 to -0.09)), weight (-1.59 kg (95% CI -2.48 to -0.70)) and physical inactivity (standardised mean difference -0.11 (95% CI, -0.21 to -0.01), but no effect on LDL-cholesterol. In studies with a short follow-up (<12 months) effects were larger than in studies with a longer follow up (≥12 months). There was no effect on cardiovascular events (2 studies).

Conclusions

The cardiovascular risk profile of older people can be improved using Internet-interventions, but the effects are modest and decline with study duration. There is currently insufficient evidence for an effect on incident cardiovascular disease.

³Movimento Giotto, Bologna, IT

⁴Istituto Superiore della Sanità, Roma, IT

⁵Department of Life Sciences, University of Trieste, Trieste, IT

⁶Centro Regionale di Formazione in Medicina Generale, Monfalcone, IT

Background & Aim

The effectiveness of brief interventions for risky drinkers by GPs is well documented. However, implementation levels remain low. Facilitated access to an alcohol reduction website offers an alternative to standard face-to-face intervention, but it is unclear whether it is as effective. This study evaluates whether facilitated access to an alcohol reduction website for risky drinkers is not inferior to the face-to-face brief intervention conducted by GPs.

Method

In a northern Italy region participating GPs actively encouraged all patients > 18 attending their practice, to access an online screening website based on AUDIT-C. Those screening positive underwent a baseline assessment with the AUDIT-10 and EQ-5D questionnaires and subsequently, were randomly assigned to receive either online counselling on the alcohol reduction website (intervention) or face-to-face intervention based on the brief motivational interview by their GP (control). Follow-up took place at 3 and 12 months and the outcome was calculated on the basis of the proportion of risky drinkers in each group according to the AUDIT-10.

Results

More than 50% (n= 3974) of the patients who received facilitated access logged-on to the website and completed the AUDIT-C. Just under 20% (n = 718) screened positive and 94% (n= 674) of them completed the baseline questionnaires and were randomised. Of the 310 patients randomised to the experimental Internet intervention, 90% (n = 278) logged-on to the site. Of the 364 patients of the control group, 72% (263) were seen by their GP. A follow-up rate of 94% was achieved at 3 months.

Conclusions

The offer of GP facilitated access to an alcohol reduction website is an effective way of identifying risky drinkers and enabling them to receive brief intervention. The study results will be available soon and we expect to be able to present these to the conference.

OP-094

Healthy Life Style Behavior Among Turkish University Students: A Meta Analysis

Gülin Kaya, [Dilsad Save](#)

Department of Public Health, Marmara University. Istanbul, Turkey

Background & Aim

According to World Health Organization 70-80 percent of mortality causes from the diseases related with life style factors in developing countries and 40-50 percent in the developed nations. During the university education, students usually experience considerable changes in their lifestyle which often influence their health status in the following years. Therefore, it is necessary to assess their lifestyles and needs in order to give insights to health professionals for planning of health promotion activities for this population. Currently there is no Meta Analysis on Healthy Life Style among Turkish University Students. This study aims to systematically evaluate studies on Healthy Life Style Behavior of Turkish University Students

Method

Studies conducted in Turkey by using Healthy Lifestyle Behavior Scale (HLBS) were included to meta-analysis. The data were collected in Jan.-Feb. 2015 by using Google Scholar, PubMed database. Ten studies were included for analysis to assess weighted average mean values of HLBS. Subscales of the inventory -self-realization, health responsibility, interpersonal relationships, stress management, nutrition and exercise- were also analyzed. Random-effects model was used in all analyses and subgroup analyses for each examined outcome were also carried out.

Results

Total of 2932 students were included in the analyses. Age range was between 17-31 years old. Weighted average mean of HLBS was found to be $122,64 \pm 0,92$ presenting moderate level healthy behavior. Among the subscales the higher mean values were observed for self-realization. Responsibility for health and interindividual supportive measures whereas habitual exercise had the lowest means.

There was no statistically significant difference between girls and boys in terms of healthy behavior ($p=0,40$). The last grade students had significantly higher scores than those of first grades ($p=0,02$)

Conclusions

University life was found positive effect on students' healthy life style although it was not on the desired level. Health Promotion programs in this population were needed to be carried out.

Keywords: Meta-Analysis, healthy life style, university students, health promotion

Be active to stay young! Our experience on physical exercise and well-being in aged patients from a Health Care Centre

[Daniela Florentina Pruteanu](#)¹, [Francisco Antón García](#)², [Carolina Mir Sánchez](#)², [Olga Maroto Delgado](#)²

¹Quart de Poblet Health Care Centre, Valencia, Spain

²Fuensanta Health Care Centre, Valencia, Spain

BACKGROUND AND AIM: to determine if physical exercise systematically practiced by a group of aged patients from a health care centre does improve their perception on their own health and well-being.

METHOD: we anonymously applied a questionnaire (adapted SF-12) about perceived health status, to a group of 54 patients, aged 65 and older. They have been practicing physical exercise for at least six months, 3 hours a week, supervised by a 67 year old "expert patient". The questionnaire assessed their health status as they perceive it in the present compared to what they perceived before starting the physical exercise programme.

RESULTS: the group included 48 women and 6 men. Mean age: 72.2 years old. Question (Q) 1 - in the present your health status is: good 37%; very good 33.3%; excellent 16.7%. Q2 - present versus previous (before programme) health status: the same 9.3%; better or much better 90.7%. Q3 - improvement in performing your daily activities: 96.3%. Q4 - since you have started exercise, your aches: are the same 11.1%; diminished 79.6%; disappeared 9.3%. Q5 what about your state of mind: it improved a lot 57.4%; it slightly improved 40.7%. Q6 - social life improvement: it improved a lot 55.6%, it slightly improved 42.6%. Q7 do you feel with more energy: absolutely true 51.9%; true enough: 38.9%. Q8 did your quality of life improve: absolutely true 51.9%; true enough 33.3%. Q9 how do you consider your global health status in a scale from 0 to10: before practicing physical exercise 6.31; after practicing physical exercise 9.09 (p=0.000, CI 2.20-3.36).

CONCLUSIONS: in our group of patients physical exercise practiced systematically improved their perception on well-being and also their social relationships, they felt more active.

Keywords: physical exercise, aged people, health promotion

OP-096

Situations of undergoing screening tests for cancer prevention of family physicians in Ankara, Turkey

Selda Tekiner¹, Gülseren Lale², Gülsen Ceyhun Peker¹

¹Department of Family Medicine, Ankara University School of Medicine, Ankara, Turkey

²Meydan Family Health Center, Mut, Mersin, Turkey

AIM: Family physicians recommend and guide their patients to undergo screening tests for preventable cancer types. We aimed to determine physicians' self-screening rates.

METHOD: This is a descriptive cross-sectional study. Family physicians working at "Family Health Centers" in Ankara at the age of ≥ 40 years were included. A questionnaire was designed to define doctors' screening rates and it was completed face to face. The data were collected from 246 Family Health Centers between June 2013 and August 2013 and analysis was performed using SPSS version 15. Data were described as means and standard deviations (mean \pm SD) or medians and ranges. Comparisons of nominal variables were performed with the Pearson's chi-square and Fisher's exact test.

RESULTS: Of the participants 43% were between the ages of 46-50 years; 42.2% were female and 9.5% were family physician specialists while 90.5% were general practitioners. The rates of undergoing screening tests were: 8.6% for colonoscopy, 2.7% for fecal occult blood test, 60.0% for mammography, 41.1% for clinical breast examination, 60.0% for Pap smear. Having a colonoscopy ratio was 32.3% among doctors with a family history of colon cancer, and 6.9% among doctors without a family history ($p < 0.001$). Of the doctors 95.6% agreed with the necessity of undergoing screening tests, and 32.9% believed that family physicians should be responsible to ensure patients' undergoing screening tests. The ratio of "not believing about the responsibility of the patients' tests" was higher among general practitioners who didn't receive speciality education compared with the specialists ($p = 0.041$). The ratio of applying their own family physicians for screening tests was only 3.5%. The main reason for not undergoing screenings was "lack of time".

CONCLUSION: Family physicians had inadequate screening status for cancer. It is essential to draw physicians' attentions about cancer screening tests for themselves.

Keywords: cancer prevention, family physicians, screening

OP-097

Pneumococcal vaccination in primary care settings

Peter Vajer, Peter Torzsa, Ferenc Tamás, László Kalabay

Department of Family Medicine, Semmelweis University Budapest, Hungary

BACKGROUND:

Influenza and pneumococcal vaccination are important preventive care measures to reduce morbidity and mortality in high-risk groups. Pneumococcal vaccination has also been shown to have effects additional to influenza vaccination in preventing pneumococcal bacteraemia, particularly in high-risk groups. Despite recommendations for immunization there is evidence of poor coverage of high-risk groups.

OBJECTIVE:

The aim of this project was to show whether a campaign based in general practice is a practical and appropriate mechanism for increasing uptake of pneumococcal vaccine among high risk patients.

METHOD:

Every patient vaccinated with influenza vaccination was informed either by the nurse or by the GP about the importance of pneumococcal vaccination and was asked to fulfill a short questionnaire in 20 GP settings in Hungary during 2012/13 influenza vaccination campaign. Those who had been vaccinated by pneumococcal vaccine fulfilled a second questionnaire later on.

RESULTS:

4000 patients were involved in the study, 576 asked for prescription of pneumococcal vaccine, while 310 were vaccinated, 16,5% of the women and 11,6% of men (OR 1,67 CI 95% 1,37-2,04, $p < 0,001$), mean age 70,95 vs. 69,8 (OR 1,01; CI 95% 1,00-1,02; $p < 0,05$). In case the pneumococcal vaccination was offered by the GP the rate of asking for prescription was 33,6 vs offering by the nurse it was 8% (OR 6,33; CI 95% 5,23-7,67; $p < 0,001$), while the rate of vaccinated patients 17,7% vs 4,4%. The number of vaccinated patients from the year 2011/12 to 2012/13 was increased 6,32 folds ($p < 0,001$). The vaccination was refused because of the high price of the vaccine in 45%, 20% of the patients were vaccinated within 5 years, some were "afraid of the needle".

CONCLUSIONS:

A practice based campaign is an effective method of increasing uptake of pneumococcal vaccine by high risk groups. Offering pneumococcal vaccine by GP is more effective then by practice nurse.

Keywords: pneumococcus vaccination

OP-098

Yield of screening for atrial fibrillation in primary care during influenza vaccination in the Netherlands

Femke Kaasenbrood¹, Monika Hollander¹, Frans H Rutten¹, Leo J Gerhards², Arno W Hoes¹, Robert G Tieleman²

¹Julius Center for Health Sciences and Primary Care, University Medical Center Utrecht, Utrecht, The Netherlands

²Department of Cardiology, Martini Hospital Groningen, Groningen, The Netherlands

Background & Aim. Atrial fibrillation (AF) mainly affects older people, and it may remain asymptomatic. Practice guidelines recommend screening in community-dwelling persons aged 65 years and over. Single-lead electrocardiography would facilitate such screening. We wanted to assess the yield and feasibility of screening with such a device.

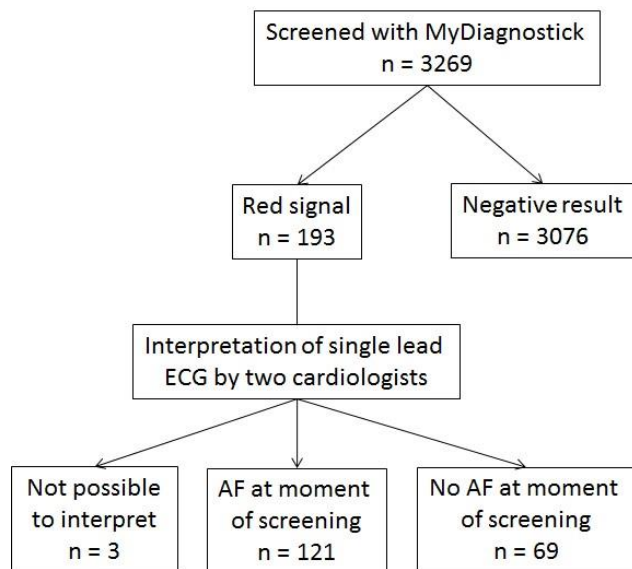

Methods. We used the MyDiagnostick to screen for AF in persons who participated in influenza vaccination sessions. The study was performed in ten Dutch general practices. In cases with a 'red light' a one-minute ECG registrations was analysed by two cardiologists. Data on comorbidity were assessed by scrutinizing the electronic medical files of the general practitioners. Multivariable logistic regression analysis was performed to establish the relation between patient characteristics and a novel screen-detected diagnosis of AF.

Results. In total 9,450 community-dwelling persons participated in the influenza vaccination, and 3,269 (34.6%) of them held the MyDiagnostick device. In total, 37 (1.1%) new, previously unknown cases of AF were detected. Prior TIA or stroke (odds ratio 6.05; 95% CI 1.93 to 19.0), and age (OR 1.09 per year; 95% CI 1.05 to 1.14) were independent predictors for a screen-detected diagnosis of AF. Of the 37 screen-detected AF cases, 2.7% had a CHA2DS2-VASc of zero, 18.9% a score of 1, and 78.4% a score of 2 or more. Thus, the majority of new detected cases should receive adequate stroke prevention with oral anticoagulant therapy.

Conclusions. Screening with an easy to use single-lead ECG device during influenza vaccination in Dutch general practices resulted in 1.1% new cases of AF. It was feasible to 'mass' screen for AF within a short duration of time.

Keywords: atrial fibrillation, screening, primary care

Flow chart of study

Baseline characteristics of individuals who held the MyDiagnostick divided in new screen-detected cases of AF, patients already known with AF, and a random sample of patients with no AF

	Newly detected AF with screening N = 37	Already known with AF and a red light with screening N = 84	Sample of patients with no AF* N = 220
Men (%)	21 (56.8)	49 (58.3)	101 (45.9)
Mean age (SD)	75.9 (8.6)	75.6 (8.3)	65.9 (12.4)

Preventive Health care with simulations

Mateja Skufca Sterle, Uros Zafosnik, Antonija Poplas Susic
Community Health Centre Ljubljana, Slovenia

Background and AIM:

The purpose of this paper is to present a modern form of health education, whose main objective is a change in patients' lifestyle, thereby reducing the risk of morbidity. At the simulation center (SIM Center) of Community Health Centre Ljubljana we implement simulation in the prevention. By integrating simulation into preventive programs we want patients to achieve a faster and more reliable insight into probable consequences of their lifestyle, unless opted for a healthy lifestyle. The simulations are a much easier way of achieving insight than lectures. Through the process of learning and repetition of individual simulation the patients experience negative experiences, which will help them motivate to change their lifestyle. The main motivator and the therapeutic source is the distress of the negative experiences and the resulting self-help. Distress will be created with the help of professionally managed simulated experiences. For example, for smokers we use the simulator to achieve reduced lung capacity in a way that patients experience shortness of breath, which is the main characteristic of chronic obstructive pulmonary disease.

METHODS:

Preventive program includes patients who have already received preventive activity by a reference nurse and still have not made the lifestyle changes. We will try to motivate a change in lifestyle with the modern form of health education. Quality indicators that will be monitored: smoking cessation and weight loss.

Expected RESULTS:

We will achieve changes in lifestyle for at least 30% of participants in the prevention program.

CONCLUSION:

At the SIM Center of Community Health Centre Ljubljana we implement prevention programs with the help of simulations, whose main objective is a change in patients' lifestyle, thereby reducing the risk of morbidity. It is about learning from a crisis situation - positive learning from an unpleasant experience.

Keywords: simulation in the prevention, prevention, healthy lifestyle

Characteristics of Dutch general practices participating in a cardiometabolic prevention program

Daphne Stol¹, Ilse Badenbroek¹, Suzanne Van Der Velden¹, Monika Hollander¹, Mark Nielen², Francois Schellevis², Niek De Wit¹

¹Julius Center, UMC Utrecht

²NIVEL

BACKGROUND: We presently conduct the INTEGRATE study, which aims to investigate the effectiveness and cost-effectiveness of a "Personalized Prevention Approach for Cardio-Metabolic Risk" (PPA CMR) and to assess determinants for participation and compliance. Tailored lifestyle intervention is part of the intervention. Experiences with multidisciplinary integrated care programs and motivation for preventive activities of participating practices are expected to affect the effectiveness of PPA CMR. The aim of this qualitative study was to determine the motivation for preventive activities in the participating practices as well as to determine possible impediments for successful implementation of PPA CMR.

METHOD: a survey among practices that participate in the INTEGRATE study.

RESULTS: Currently, data from 22 of the 38 participating practices are available. The practices consist of group-practices (36%), health care centres (32%), solo-practices (23%) and duo-practices (9%) distributed across the Netherlands. 82% of the practices are accredited by the Dutch college of GP's. All practices offer integrated care programs for diabetes, 91% also for COPD and 82% for cardiovascular risk management. Implementation of the PPA CMR intervention is performed by practice nurses in 73% of the practices. Practice nurses are well trained in giving lifestyle advice in 94% of the practices. The mean rating practices gave themselves for interest in prevention was 7.9 (on a scale of 10) and 7.7 for motivation for prevention. 27% of the practices indicated they were well informed about locally offered lifestyle interventions. Practices consider insufficient financing (64%) and limited availability of staff (59%) impeding factors for implementation of PPA CMR.

CONCLUSION: Participating practices are motivated and prepared for preventive activities and are experienced in working with integrated care programs. They are often not aware of the available lifestyle interventions in their area and consider staff shortage and inadequate financing as major obstacles for implementation of PPA CMR.

Keywords: prevention, cardiometabolic disease, general practice, implementation

Primary Health Care Application and Coronary Risk Factor Management of Coronary Heart Disease Patients

Tevfik Tanju Yilmazer¹, Caner Çabuk¹, Kurtuluş Öngel²

¹Clinic of Family Medicine, Tepecik Training and Research Hospital, İzmir, Turkey

²Department of Family Medicine, Katip Celebi University, Izmir, Turkey

Background & AIM:

Coronary heart diseases are among the leading causes of mortality and morbidity globally. More than three quarters of deaths related to coronary artery diseases can be prevented by appropriate lifestyle adjustments that can easily be achieved through primary health care (PC). We aimed to question the presence and evaluate the effect of "primary health care coronary risk management" for coronary heart disease (CHD) patients.

METHOD:

The study has a descriptive cross sectional design. It was carried out between October 1st and December 31st 2014. The research population consisted of patients who were diagnosed to have CHD by coronary angiography. A questionnaire pertaining utilization of PC by the patients and the intervention of family physician involving CHD management was applied. Statistical analysis was made by stating the frequency of datum, chi-square, ANOVA and T-test for the ratios.

RESULTS:

The number of patients enlisted was 177 with 46 females (26%) and 131 males (74%) with an age average of 60.8 ±11.061 years. It was seen that 76.8% of patients had at least one comorbid disease with high blood pressure being the most frequent (58.2%). When the application to PC was questioned it was found to be 75.1% for CHD patients and the application was statistically significantly high for patients with a chronic comorbid disease (p=0.007). The majority of applications to PC was for represcription of medication (86.4%). It was noted that blood pressure assessment was 65.4%, testing the lipid profile 65.4%, glucose level determination 38.3%, questioning smoking 63.2%, diet recommendation 41.4% and exercise prescribing by the family physician were 44.4%.

CONCLUSIONS:

It was seen that CHD patients tried to make use of PC before their disease becomes manifest that might be mortal. So the opportunities to adjust life changes and management is vital and can be applied at PC.

Mandala Health: transformation of habits from the cultivation and use of popular plants used as medicine

Fernando Erick Damasceno Moreira, Ubirajara José Picanço Miranda Junior, Fernando Ferreira Natal, João Ricardo Simczak Prates

Mobile emergency medical services, Federal District, Brazil

I bring here the description of a project developed in a basic health unit of the family - BFHU, in the village of West City, Goiás, Brazil. The BFHU located in a region called Village Mesquita is peculiar for its rural characteristics and african-dencendent. In this sense often is noticeable during the sessions the use of cultivated plants at home in various therapies. From this, it has become feasible to create a therapy space that brings a garden with vegetables for daily use and popular plants used as medicine. In this space, named as Health Mandala, there is the herbal cultivation brought by the community and thus it is possible, the discussion of how and why they are used, converging scientific and popular knowledge. In addition, the environment is conducive to discuss health promotion, especially with the focus on healthy eating habits.

The creation of this project came from the meetings with the group of hypertension and diabetes with members of the family healthcare team. At these meetings, the contribution of all was essential. The chosen design was based on the design garden mandala in the Brazilian Service of Support for Micro and Small Enterprises - SEBRAE, which proposes the integration of sustainable systems. The record of first impressions was made from the collection of opinions in the form of satisfaction questionnaire. The continuity of the project is motivated by the direct return of the works in the garden with the daily use of own cultivars of local culture. Project results are subjective and raised on a daily basis, allowing realize that it is possible to create an environment that enables the discussion and the transformation of habits from the cultivation and use of popular plants as medicine.

Hereditary Cancer: Approach by the Family Doctor

Mariana Anete Mira¹, Ana Sofia Pena¹, Ana Matos², Ana Paula Cardoso¹, Susana Rita¹

¹USF Samora Correia, ACES Estuário do Tejo, Portugal

²UCSP Benavente, Extensão Porto Alto, ACES Estuário do Tejo, Portugal

BACKGROUND & AIM: Most hereditary cancers have multifactorial origin, with the interaction of genetic and environmental factors. There are also diseases that increase the predisposition to cancer, such as Fanconi anemia, Ataxia telangiectasia, Neurofibromatosis, Tuberous Sclerosis, Von Hippel Lindau disease, Hemihypertrophy, Down Syndrome, among others. But only 5 to 10% cases of cancer have a well defined genetic transmission. Thus, the most common familial cancer syndromes are Adenomatous Polyposis of the Colon (APC), Hereditary Non-polyposis Colorectal Cancer (HNPCC), Hereditary Breast Cancer, Hereditary Ovarian Cancer, Medullary Thyroid Tumor, Li-Fraumeni Syndrome and Hereditary Diffuse Gastric Cancer.

METHOD: A detailed theoretical review of the European and American guidelines published between 2000 and 2014, for addressing these hereditary cancers was taken, as well as on the role of the family doctor in the whole process of diagnosis and monitoring of these families.

RESULTS: There are five alerts that must prompt the family physician to suspect of a familial cancer: several relatives in the first or second degree with the same type of tumor or relatable tumors, a rare form of cancer in two members of the family, a cancer beginning at a younger age than usual, bilateral tumors and synchronous or subsequent tumors. After the suspected diagnosis, the family doctor should send the family to a query of Medical Genetics and, if identified a situation of hereditary cancer, should apply prevention strategies according to the protocols already established and joint interventions in the various specialties, leading a multidisciplinary approach to these families.

CONCLUSIONS: The family physician is in a prime position to identify families at risk of these oncologic diseases, because it follows the various members of the family, with the aim of promoting health and detect the disease as early as possible, always applying possible traces.

OP-104

A comprehensive prevention program in Slovenia

Simona Repar Bornsek, Tonka Poplas Susic

Department of general medicine, Community Health Centre Ljubljana, Ljubljana, Slovenia

Background&AIM: Due to increasing morbidity and mortality from chronic non-communicable diseases and their complications a number of preventive programs have been implemented by developed countries in order to prevent or postpone their onset by timely lifestyle changes in people at risk.

METHODS: In 2011 in Slovenia a new concept of active screening of population on chronic non-communicable diseases was introduced. In model practices, all individuals over the age of 30 are invited to health screen. Depending on risk factors findings, they are advised on healthier lifestyle choices and changes in risky behaviour. Based on the results, each person is classified into one of 3 categories: healthy, healthy with risk factors and chronic patients.

RESULTS: In 2014, the Community Health Centre Ljubljana's 46 model practices performed 8,833 screenings, which revealed 774 new chronic patients (8.8%), 6,876 patients with risk factors (77.8%) and 1,183 patients without risk factors (13.4%). Among newly discovered chronic patients, most patients had hypertension and diabetes, followed by patients with COPD, depression and asthma.

CONCLUSIONS: Many patients do not respond to the preventive screening due to various reasons. Those with physical disability, social isolation or specific psychological problems are specially at risk for late recognition and onset of treatment. In order to reach this population, a preventive screening examination at the patient's home was implemented. The cooperation between a community nurse and a family physician team by entering the patient's home offers a better sense of the patient's living environment and habits and allows appropriate counselling on lifestyle changes in accordance with the patient's capabilities. In this way, the program of screening and early intervention can be offered to the most vulnerable groups of the population.

Disclosure: In Health Centre Ljubljana, management of patients at their home environment is a pilot project, supported by Norwegian finance mechanism program

Keywords: preventive program, screening, community nurse, at home treatment

Determinants of Geriatric Adherence to Medications in Serse Elian City, Menoufia Governorate, Egypt

Aml Ahmed Salama¹, Abd Elrahman Abd El Fatah Yasin², Walaa Mohamed Elbarbary³

¹Lecturer of family medicine department, Faculty of medicine, Menoufia University, Egypt.

²Prof of clinical pharmacology Faculty of medicine, Menoufia University, Egypt.

³Residence of family medicine ministry of health, Egypt

BACKGROUND:

Adherence to therapies is corner stone of treatment success. Medication non adherence in geriatric patients leads to substantial worsening of disease, death and increased health care costs. A variety of factors are likely to affect adherence. Barriers to adherence could be addressed for each patient to deal with. **OBJECTIVE:** To assess the determinant factors of medication adherence in old patients live in their own houses. **METHODS:** This is a cross-sectional study. Sampling was done through systemic random sample chosen from family health records, then available elder persons included in the records were interviewed at their own homes. The study sample included (102) geriatric patients aged 70-85 years -old, living in their own homes in Serse Elian City, Menuofia Governorate. Information were collected from the prescription in the file of the patient and home visits were done to examine their daily drug consumption and their cognitive functions after their approval to participate. For each participant adherence scores were calculated based on observations of the participants' actual use of drugs and information in the prescription of the patients. Other data related to the patients demographic, functional, psychosocial and health complain were also fulfilled. The studied groups divided into adherent and non adherent to study the possible determinants of that adherence to their prescribed medication.

RESULTS: Males geriatric patients were found to be more adherent than females (64 % versus 36%). Functional complain, feeling loneliness, law perceived health, cognitive impairment and patients satisfaction of their management plane were found to be significant factors in restrict following the old patient to their prescribed drugs.

CONCLUSIONS: Medication non adherence is not a rare event in elderly patients and is associated with functional complains and cognitive impairment.

-High	15 (20)	7 (25.9)	22	
- Middle	26(34.7)	12 (44.5)	38	
- Low				

Mean of age of patients was 74.59±3.8 and 73.37±3.4 for the first group and the second group respectively. This was statistically not significant. Males constituted higher percentage of adherent group than females (64 % are male versus 36 5% females). Sex constituted statistically significant difference.. Education, occupation, living alone and socioeconomic stander constituted non significant difference in adherence of geriatric to medications.

Table (2): Patients characters as determinants of drug adherence in geriatrics:

	Group (1) Adherent Group (N =75) N (%)	Group (2) Non -Adherent Group (N=27) N (%)	Total N = 102 No (%)	X2 P value
Functional complain				
-IADL.				
⊗ Difficulty	23 (30.7)	16 (59.3)	39 (38.2)	6.87 <0.001

-law perceived health				
Yes				
No				
Health problems				
-One	27 (36)	9 (33.3)	36 (35.3)	
-Two	41 (54.7)	17 (63)	58 (56.9)	1.08 (0.58)
-Three or more	7 (9.3)	1 (3.7)	9 (8.8)	

Functional activity of the patients as Instrumental activity of daily living, Basic activity of daily living and failure in getting up constituted a highly statistically significant difference(p value <0.01) in adherence to medications Patients who had no difficulty in performing daily activity constituted higher percentage of adherent groups (69.3 %). Psychological complains as depressed mood shows no statistically significant difference (P value > 0.05) while forgetting events shows highly statistically significant difference (p value > 0.001). Number of health problem, having more than one chronic complains constituted no statistical difference among groups. Higher percentage of adherents group complains no loneliness which constituted statistically significant difference (P value < 0.05) while loss of partner shows no statistically significant difference (P value > 0.05). Sensation of law perceived health and satisfaction regarding their medication show statistically significant effect on adherence to medications (P value < 0.05)

Table (3): Person Correlation of patient's mini-mental status and adherence score to prescribed medications

Parameter	Adherence score
	r P value
Patient mini mental state	0.421 < 0.001
- Three items recall	0.138 0.168
- Clock drawing teat	

Mini mental state was measured for each patient, a score was given for each patient according to their ability to recall three word after sometime and their ability to draw a face of clock, three items recall score was positively correlated to the adherence score which constituted a statistical significant correlation while clock drawing score constituted non significant correlation to the total adherence score

Table (4): Medications parameters as determinants of adherence of geriatric patients to their medications:

	Group (1) Adherent Group (no=75)	Group (2) Non -Adherent Group (no=27)	Total No (%)	X2 p value
	No %	No %		
Price of the drug				
Cheap	14 (18.7)	7 (26)	21 (20.6)	
Faire	53 (7.2)	15 (55.5)	68 (66.7)	
Expensive	8 (0.1)	5 (12.7)	13 (12.7)	2.14 (0.34)
Number of prescribed drugs				
<=3	57 (76)	24 (88.9)	81 (79.4)	2.01 (0.15)
>3	18 (24)	3 (11.1)	21 (20.6)	
Health Insurance	39 (52)	11 (40.8)	50 (49)	3.23 (0.35)
-Governmental	11 (14.7)	8 (29.6)	19 (18.6)	
-primary care	25 (33.3)	8 (29.6)	33 (32.4)	
-private				

Medications parameters as price of the drugs, number of prescribed drugs, availability of drugs and presence of health insurance constitute no statistically significant effect on adherence to medications

OP-106

The contribution of therapeutic education in the empowerment of patient with cardiovascular disease. About an educative group intervention in South West area of France

Mélanie Afonso¹, Christine Quélier², Jean Louis Demeaux¹, Bernard Gay¹

¹Department of General Practice, Bordeaux University, Bordeaux, France

²Bordeaux School of Public Health, Bordeaux University, Bordeaux, France

Background and AIM: Many national programs have focused on the importance of therapeutic patient education in the management of chronic diseases. The need for a patient-centred approach is recognised to improve its empowerment. It's particularly true for cardiovascular diseases which are one of the leading causes of death in France with more than 180,000 deaths per year. Drug prescription alone doesn't often allow obtaining, a satisfactory impact on the health status of patients with cardiovascular risk factors. The research question is: how therapeutic education led to the empowerment of the patient? The aim is to analyse patient's abilities and to identify factors acting on empowerment.

METHOD: Qualitative study, conducted by semi-structured interviews with patients, doctors and educators involved in a series of educative group interventions conducted on the south west area of France, as part of the ETHICCAR study. Analysis of thematic content and identification of key topics.

RESULTS: The group intervention showed that the patients became aware about their power to act and their options in health. The acquisition of abilities was more various: some of them thought they had enough self-management; other had more or less difficulties daily maintaining it. The interviewed subjects suggested the need for a remote relay and express the wish for greater individualization of the care. This work also highlighted the factors limiting the participation and suggests a lack of enthusiasm for the creation of links between participants.

CONCLUSIONS: Therapeutic patient education seems a good initiative and increases the patients' confidence of their power to act. Further work will be necessary, in particular, around the concept of participation in order to let the patient ultimately achieving, empowerment to both individual, organizational and community levels.

Keywords: therapeutic education, empowerment, cardiovascular disease

OP-107

Effectiveness of seasonal influenza vaccination in diabetic patients: Systematic review

Ludovic Casanova¹, Patrick Villani², Pierre Verger³

¹Aix Marseille University, Department of general practice, Marseille, France

²Aix Marseille University, UMR_S912, IRD, 13006, Marseille, France

³INSERM, UMR912 "Economics and Social Sciences Applied to Health & Analysis of Medical Information" (SESSTIM), 13006, Marseille, France

Aims

The influenza virus is a major cause of morbidity and mortality in diabetic patients. The immunological effectiveness of seasonal influenza vaccination has been demonstrated in patients with diabetes type 1 and 2. However, diabetes is the only remaining major comorbidity not have a systematic literature review or meta-analysis on the efficacy of vaccination in terms of morbidity and mortality.

Methods

Systematic literature review about the effectiveness of seasonal influenza vaccination in diabetics respecting the PRISMA Statement. PUBMED and EMBASE databases were searched using the following equation: ("influenza vaccines" [MeSH Terms] OR "Influenza, Human" [MeSH Terms]) AND ("diabetes mellitus" [MeSH Terms] OR "diabetes" [All Fields]). According to the PICO process, the study populations should be composed of diabetics, intervention was seasonal influenza vaccination only, all types of design and all morbidity and mortality outcomes were retained.

Results

Two reviewers selected 120 articles with the title, 34 articles with the abstract to include nine studies in this literature review. There were 7 cohort studies, two case-control studies and no randomized clinical trial. Beyond the small number of studies found, we targeted three common boundaries to all studies: the use of direct criteria of judgement, bias vaccination (a priori difference of subjects choosing to vaccinate) and the absence of adjustment regarding the anti-vaccination pneumococci which shares the same clinical picture as influenza. The most recent study found differences in morbidity and mortality between the groups vaccinated and unvaccinated outside the epidemic period revealing the methodological limitations inherent in all observational studies.

Conclusion

To date there is no evidence of efficacy of seasonal influenza vaccination in diabetics and even less in diabetic subjects under 65 years.

Keywords: diabetes mellitus influenza vaccine Review

Dengue notifications from emergency service

Gustavo Aguiar Alvarenga Amorim, Bianka De Oliveira Silva, Danielle Pulcinelli

Universidade Federal de Goiás

The Brazilian summer not only means beaches, but also an endemic dengue's period when there is an ascending notification number, although an incomplete or inefficient anamnesis provides unreal notifications.

The aim of this project was to classify the risk of the patients referred from the emergency service to the Family Medicine service in CAIS Jardim Guanabara III, Goiânia Goiás, Brazil; stratify the main differential diagnosis and question the notifications number veracity.

During the internship hosted in CAIS Jardim Guanabara III, from February, 2nd until March, 6th the students helped by their staff analyse the medical records.

In February 11 people was referred from de Emergency service, 63,64% were really dengue, 9,09 % acute gastroenteritis 9,09% urinary tract infection, 9,09% upper airway cough syndrome (UACS) and 9,09% follow up lost. During March first week, there were 8 notifications, 50,0% were dengue, 25,0% acute gastroenteritis, 12,5% urinary tract infection, 12,5% upper airway cough syndrome (UACS), and no follow up lost. The most commons symptoms were, by order, headache, myalgia, nausea, itch and retro-orbital pain. For the other the most commons symptoms were headache, fever, myalgia. The 8 patients really diagnosed with dengue were stratified: 66,68 group A; 16,66% as B; 16,66% C, zero D.

In conclusion, it is presumed that the dengue cases rates are higher in March and that those patients who did not attend the service are not dengue cases because they would not feel well without proper management. Therefore, there is a huge number of misdiagnosis in the emergency service, so is important so think if are the notification numbers provided to the prevention strategies real, there are notifications that are not dengue cases in the other hand there are also places were the notification are not fulfilled.

Keywords: dengue; notification; anamnesis

The extent to which lifestyle and health behaviours of General Practitioners in the west of Ireland influences Health Promotion practices with their patients

Thomas Walsh, Pamela Healy, Aisling Egan, Maureen Kelly

, Western General Practice scheme, HSE West, Ireland

INTRODUCTION:

Doctors' health is important and can potentially impact on the health of patients.

Doctors practicing healthy behaviours counsel patients more frequently and effectively and serve as credible health role models. The aim of this study is to establish the lifestyle and health behaviours of GP's, their health promotion practices and determine if there is a relationship between the two.

Methods

This study is an anonymous, quantitative cross-sectional postal survey. Data were analysed using Gnu-PSPP.

Results

N= 91, 33% response rate. 75% (n=68) of GP's report they are in good health.

59% (n=54) comply with WHO recommendations for exercise. 5% (n=4) are current smokers, while alcohol is consumed on average 7 days per month. Only 59% (n=54) have their own GP and 62% (n= 56) receive the flu vaccine. 95% (n= 86) rate preventive counselling as important, with the majority of GP's counselling patients

about diet 82% (n= 75), exercise 78% (n= 71), and smoking cessation 81% (n= 74) daily.

GP's report high levels of confidence in their counselling practices. Up to 82% feel that their own behaviours impact on preventive counselling. As the BMI of GPs increases, the frequency of diet counselling decreases, $p=0.035$. Common barriers to health promotion were lack of time, compensation and patient interest.

Conclusions

GPs perceive themselves to be healthy, data suggests here is scope for improvement in GPs' self-care.

Most GPs believe preventive counselling is important.

GPs perceive that self behavior impacted strongly on their counselling practices.

GPs are confident in their ability to counsel patients and do so frequently.

Significant barriers to health promotion exist which need to be addressed to improve patient care.

Problems of Turkish Speaking Community In Accessing Healthcare in the UK

Cemal Kavasogullari¹, Ulvan Ozad⁴, Can Hazar³, Isabella Roiatti²

¹NHS Education Scotland

²NHS Lanarkshire

³Turkish Cypriot Healthcare Professionals Association

⁴Anglo-Turkish Healthcare Professionals Association

Background and Aim

There is a large Turkish speaking community (TSC) in the United Kingdom (UK) with estimated numbers ranging from 120.00 to 400.000. TSC has a diverse socioeconomic background ranging from refugees to pensioners with majority belonging to the low socioeconomic status. It is well documented that minorities or ethnic communities in the UK are less likely to have access to healthcare services or are worse at utilizing available healthcare resources compared to the native population. Various studies shown that TSC in the UK also belongs to this underserved group adversely affecting their health and wellbeing. With this review we aim to summarize the literature focusing on TSC in order to identify underlying common themes.

Method

Literature review. Research from year 2000 and onwards conducted in the UK has been extracted from online resources. 11 articles focusing on TSC and 36 articles on general ethnic and minority health has been identified and included in the review.

Results and CONCLUSIONS:

All research conducted on TSC in the UK unanimously conclude that TSC is disadvantaged in both accessing and utilizing NHS services. Language is expressed recurrently as an important barrier restricting access to healthcare. In a study conducted on the global inhaler technique, coordination and breathing was worse in Turkish speakers with poor English as only 17% had an adequate technique. In a stop smoking study, campaigns produced in Turkish language was found to be more effective in reducing smoking by 6.4%. There is a high demand for interpretation services among TSC during consultations creating a strain in limited NHS resources. Low socioeconomic class, inadequate access to healthcare services, worse physical well-being and poor integration of community are factors adversely affecting the quality of life of the TSC. Further research looking into ways of tackling these factors are required urgently.

Keywords: Turkish speaking community in the UK, ethnic health, problems in accessing healthcare

What is the Health literacy of Students who entered for Medicine and Nursery Faculty in Dokuz Eylul University?

Candan Kendir Copurlar, Mehtap Kartal, Kürsad Akkaya, Inan Arslantas
Department of Family Medicine, Dokuz Eylul University, Izmir, Turkey

AIM: Health literacy (HL) is the degree of a person to gather, understand and interpret health information appropriately to improve personal health. It consists of understanding of prescriptions, chronic disease management, analytical decision making and usage of health system appropriately. According to data of "European Project", where Health Literacy Scale-European was used, adequate HL level in Turkey is %30.4. "National Action Plan to Improve Health Literacy", prepared in USA in 2013, emphasize the importance of health education of adolescents to increase HL in adulthood. This study aimed to determine HL levels of students who apply to medicine and nursery faculty in Dokuz Eylul University (DEU).

METHODS: This cross-sectional study was conducted in DEU in Izmir, Turkey. Participants were 585 students who applied to medical and nursery faculty in September, 2014. Response rate was 88% (n=515). REALM (Rapid Estimation of Adult Literacy Measurement) and NVS (Newest Vital Sign) tests, validated for Turkish by Ozdemir et al., were used and in addition to sociodemographic questionnaire and General Health Scale (GHS).

RESULTS: Of the participants 63.7% were female, 52% were starting medical faculty. The mean score of all participants for REALM, NVS were 61.2±3.2; 3.4±1.6, respectively. According to GHS, 7.5% of students had high risk for psychiatric disorder. According to REALM scale, 36.4% of the participants had limited HL while according to NVS scale, 30.2% had limited HL and 15.0% had inadequate HL. While REALM scores were higher in nursery students, NVS scores were higher in medical students.

CONCLUSION: In Turkey only limited number of studies defined HL and as known this is the first study focused on adolescents who will be future physicians and nurses. More studies should focus on HL of adolescents and more health promotion attempts should be done to increase HL in adolescent age for healthier adults in future.

Knowledge, attitudes and behaviors about breast self examination and mammography among female primary healthcare workers in Diyarbakır, Turkey

Ozgun Erdem¹, Izzettin Toktas², Kevser Ates Cigdem², Murat Koc³

¹Kayapınar Family Health Center Number 9, Diyarbakır, Turkey

²Kayapınar Society Health Center, Diyarbakır, Turkey

³Public Health Manager, Diyarbakır, Turkey

AIM: This study aims to determine the knowledge level of the female primary healthcare workers about breast cancer and to reveal their attitude and behaviors about breast self examination and mammography.

METHOD:

This cross-sectional study was conducted among female primary healthcare workers who work in family health centre. There were 407 female health professionals as the study population. Potential participants were informed verbal by phone and also nominally by e-mail about the aims of the study and then asked if they would agree to participate. The online questionnaire form was sent to all of the female primary healthcare workers. 91% (n=369) of female primary healthcare workers agreed to participate. The questionnaire consisted of three parts: socio-demographic characteristics, knowledge about breast self examination, and actual practice of breast self examination. SPSS for Windows Version 21.0 Statistical package was used in data analysis.

RESULTS:

The mean (SD) age of the female primary healthcare workers was 33,1 ± 6,8 (range, 20- 54 years). The other socio-demographic parameters are showed at table 1. There is a low correlation between age and knowledge level of healthcare workers r=0,144 (p=.005). The healthcare workers who practiced breast self examination had significantly higher knowledge level (p=.001) than those who had not (table 2). The respondents had high knowledge level of breast self examination; however, the knowledge level of breast cancer and mammography screen was low (table 3).

CONCLUSIONS: While the female primary healthcare workers in this study had adequate knowledge of breast self examination, this is not reflected in their attitudes and practices. The knowledge level and attitude of healthcare workers are important factors in the control of breast cancer. Emphasis should be laid on breast self examination in undergraduate and postgraduate courses for primary healthcare workers, as they are mostly involved in patient education.

Prevalence of condom utilization by female prostitutes in STD-HIV Comprehensive Clinic of Primary Health Service of Kosambi, Tangerang, Indonesia

Fika Ekayanti¹, Suherman Suherman², Risahmawati Tholib¹, Marita Fadhillah¹, Ayu Indriyani Munggaran¹, Dahniar Anindya¹, Fernaldi Angghada¹, Khoiron Muhsinin Putra¹, Sheila Inayatullah¹

¹Department of Community Medicine, State Islamic University of Syarif Hidayatullah, Jakarta, Indonesia

²Puskesmas Kosambi, Health Department of Tangerang District, Banten, Indonesia

Background and Aim

Sexually transmitted disease (STD) has set as the top ten reason of encounter in developing country. Condom utilization for preventing STD, is one of the community package program that was held by the ministry of health in Indonesia. The study aimed to describe the prevalence of condom utilization by female prostitutes within a previous week and the incident of STD's symptom.

Method

The cross sectional survey was conducted between Augusts to October 2014 in the STD-HIV Comprehensive Clinic of Primary Health Service of Kosambi, Tangerang, Indonesia. There were 95 samples that were selected by simple random sampling from the medical record of female prostitutes that worked in the prostitution area of Kosambi. Ten respondents was interviewed to identify their reason for using condoms.

Results

Age of respondents mostly were 18 years old (15 persons; 15.8%) and 14 persons (14.8%) were aged under 18. The level of education mostly in junior high school (60%). There were 36.8% of female prostitutes who always had their client used condoms, while 36.8% were seldom and 26.4% were not used it at all. From 95 respondents, 39 respondents (41.1%) had STDs. They were only 23% respondents who always use condoms, 41% seldom, and 36% never use condoms. The reason of interviewees to use condoms were afraid of getting sick (30% who always use condoms), forget or has got the medicine (30% who seldom use condoms), reduce the sexual excitement (40% who never use condoms).

Conclusion

The awareness of female prostitutes about the importance for using condoms were still low. It needs continuous intervention from health providers to gain attention from the high risk community in order to reduce STD incidences.

Keywords: Sexually Transmitted Disease (STD), condom, female prostitute.

Recognition of Core Elements of Medical Professionalism among Medical Students and Faculty Members

Firdous Jahan¹, Muhammad A Siddiqui²

¹Department of Family Medicine, Oman medical college sohar oman

²School of Health Sciences, Queen Margaret University, Edinburgh, UK

Background & Aims

The goal of the medical profession is to provide best care for the patients. Teachers' professional attitude effects the learner as they see their role models behavior and they follow the same. There are various factors contributing to professionalism which may allow the development of more effective approaches in promoting the quality of medical education. The aim of this study was to recognize core element of professionalism in medical students and faculty and to compare students' and faculty perception regarding professionalism.

Methods

The study comprised of a questionnaire survey of 109 students (44 Pre-clinical 5th year and 65 clinical 7th year) and 83 faculty members (17 basic sciences and 66 clinical) at Oman Medical College. Participants were invited for self-filled survey questionnaire in which core elements were divided - professional knowledge, professional skills and professional attitude and qualities essential for professionalism. Statistical analysis was performed using SPSS 20.v. Data were expressed in frequencies and percentages. Chi-square and Mann-Whitney U tests were used for comparative analysis.

Results

Response rate were 65.6% (109 of 166) among students and 75% (83 of 110) from faculty members. Response of professional skills and attitude among the student and faculty group was significantly different ($p < 0.001$). Updated knowledge and clinical competency response was appeared to be related in students' and faculty members ($p < 0.02$) and clinical and basic sciences faculty ($p < 0.001$). Students identified good communication skills (82.6%) and faculty staff identified updated professional knowledge (62.7%) as the single most important aspect of professionalism.

Conclusion

Both students and teaching faculty agreed that the top most professional elements are updated knowledge, good communication skills, and team work. However, faculty members need to encourage their students to improve their professional skills and attitude.

AN AUDIT OF VACCINATION STATUS IN A COHORT OF ELDERLY HOME CARE PATIENTS IN ANKARA, TURKEY

Doğukan DOĞRUEL¹, Mustafa Arslan BİRCAN¹, Münevver TULUNAY¹, Nisa SOLMAZ¹, Feyza ÇELİK¹, Cenk AYPAK¹, Hülya YIKILKAN¹, Derya İREN AKBİYİK¹, Süleyman GÖRPELİOĞLU¹

Dışkapı Yıldırım Beyazıt Training and Research Hospital, Family Practice Clinic

Aim

Vaccinations against influenza, pneumonia and tetanus reduce morbidity and mortality among older adults. We examined vaccination rates among elderly home-care patients.

Methods

This study is a quantitative data analysis with a cross-sectional design, comprising 212 patients aged 65 and older enrolled in Home Care Unit of Dışkapı Yıldırım Beyazıt Training and Research Hospital, Ankara, Turkey. Vaccination status were recorded by telephone interviews with the patients themselves or their caregivers.

Results

A total of 152 (71.7%) women, and 60 men (28.3%) were enrolled in study. The mean age of the patients was 80.1±6,7 years. Functional status of those patients were found to be: 77 (36.3%) dependent, 107 (50.5%) half-dependent, 26 (12.3) non dependent. The most prevalent chronic diseases were diabetes mellitus (30.7%), cardiovascular diseases (28.3%), chronic obstructive pulmonary disease (17%) and chronic renal disease (5.7%) respectively. Regular seasonal influenza vaccination rate in the last 3 years was 10.4%. One hundred sixty (75.4%) patients were not vaccinated against seasonal influenza in the last three years. There were only 7 patients who were vaccinated against pneumonia and 1 patient against tetanus. The most frequent reasons of not receiving vaccination include unawareness (57%), thinking it is not necessary (10.8), economic burden (%3.8) and concerns about side effects (2.4%).

Conclusions

Our have revealed that elderly patients and their family care givers do not have sufficient knowledge about immunization. Recognizing patterns of and barriers to immunization could have important consequences for health policy in home- care settings.

OP-116

Typology of general practitioners regarding their attitudes toward vaccination. Lessons from DIVA, a self-reported questionnaire

Luc Martinez¹, Fatoumata Fofana², François Raineri¹, Didier Duhot¹, Jean Luc Gallais¹, Guillaume Coindard¹, Didier Seyler¹, Benoit Arnould², Khadra Benmejahed², Béatrice Tugaut², François Denis³, Pascale Arnould¹

¹French Society of General Medicine

²Mapi, Lyon, France

³Department of Bacteriology and Virology, University Hospital, Limoges, France

Background & AIM: There is a gap between the vaccine coverage rate recommended and that achieved. General practitioners (GPs) play a key role in involving their patients into vaccination. This cross-sectional study aimed at creating a typology of GPs regarding their engagement in vaccination.

METHOD: We conducted an online survey among 9000 GPs registered in the mailing list of the French Society of General Medicine. GPs who agreed to participate filled in a form collecting their socioprofessional data. They were asked to complete the DIVA questionnaire for any of the disease they were assigned randomly (Tetanus, Pertussis, Measles, seasonal Influenza, Human Papilloma Virus infection or Pneumococcus infection). The DIVA questionnaire comprised 56 items divided into 7 domains (Disease characteristics and expected benefits, Vaccine properties, Information about vaccination, Practical and organizational aspects of vaccination, Adaptation to consultation context, GPs' individual experience and Engagement of the GP in vaccination). We conducted a three stages analysis: 1/multiple correspondence analysis on raw data; 2/ K-mean cluster analysis; 3/ hierarchical clustering on the first 20 clusters

RESULTS: The 1069 respondents were partitioned into 4 clusters according to their attitudes toward vaccination (very favourable, favourable, somewhat favourable and unfavourable). There was a decrease in domains' scores across the 4 clusters. GPs very favourable to vaccination (n=191) showed the highest scores for the 7 domains. Information about vaccination and GPs' individual experience act against vaccination among GPs unfavourable to vaccination (n=82). Disease characteristics and expected benefits favoured vaccination among GPs of the two intermediate clusters (favourable and somewhat favourable; n=796).

CONCLUSIONS: GPs who are very favourable to vaccination will remain favourable. GPs who are unfavourable are the most difficult to convince because their reluctance to vaccination relies more on belief than on evidence. Medical education should preferably target the two other clusters

Keywords: Vaccination, Attitude, General Practice, Physician's Practice Patterns, Questionnaires, Cluster Analysis

OP-117

Compliance of patients to recommendations of life-style changes related with cardiac risk factors: A multicentered cross-sectional study

Arzu Ayraller¹, Hülya Akan², Özlem Tanrıöver², Osman Hayran³

¹Public Health Institution of Turkey, Integrated Public Hospital, Sivas, Turkey

²Department of Family Medicine, Yeditepe University School of Medicine, İstanbul, Turkey

³Department of Public Health, Medipol University School of Medicine, İstanbul, Turkey

AIM: The aim of the study was to examine if the patients admitted to family health centers had any recommendations or counseling about cardiac risk factors before and if they had any whether they had complied to the recommendations.

METHODS: The study was conducted among adult patients admitted to randomly selected five different family health centers in İstanbul, Turkey. All patients included in the study completed a face-to-face questionnaire composed of socio-demographic variables, previous education or counseling about exercise, smoking cessation, healthy diet, hypertension, diabetic or cholesterol lowering diet, and compliance to these recommendations. Weight and length have been measured by family health doctors during out patient examination.

RESULTS: Total 948 patients, 672 women (70.9%) and 276 men (29.1%) were included in the study. Mean age was 42.64±14.35. Although high percentage of the patients declared that they had recommendation about cardiac risk factors at least once; the compliance rate of patients generally was low. The percentage of patients that had education/counseling was lower than patients that had taken only recommendation. In all sub groups, compliance was higher in patients that had recommendation and education/counseling compared to only recommendation or no recommendation at all (p<0.05). Table 1 and 2 show taking recommendation or counseling/education and compliance status both in general study population and also regarding established diagnosis regardingly.

CONCLUSION: In general, number of patients having recommendations regarding life-style changes is low in primary care even in specific diagnostic groups. The number of patients having counseling/education are even lower although it is clear that only recommendation is enough to make a life-style change; counseling and education increase the compliance of patients.

³International Primary Care Respiratory Group, London, UK

⁴Allergy and Respiratory Research Group, Centre for Population Health Sciences, University of Edinburgh, Edinburgh, UK

⁵Psychotherapy Solo Practice, Bucharest, Romania

⁶Agia Barbara Health Care Centre, Crete, Greece, Department of General Practice, University Medical Centre Groningen, University of Groningen, Groningen, The Netherlands

BACKGROUND:

Smoking cessation is the most effective intervention to prevent and slow down the progression of several respiratory and other diseases and improve patient outcomes. Romania has legislation and a national tobacco control programme in line with the World Health Organization Framework for Tobacco Control. However, few smokers are advised to quit by their family physicians (FPs).

AIM:

To identify and explore the perceived barriers that prevent Romanian FPs from engaging in smoking cessation with patients.

METHODS:

A qualitative study was undertaken. A total of 41 FPs were recruited purposively from Bucharest and rural areas within 600 km of the city. Ten FPs took part in a focus group and 31 participated in semistructured interviews. Analysis was descriptive, inductive and themed, according to the barriers experienced.

RESULTS:

Five main barriers were identified: limited perceived role for FPs; lack of time during consultations; past experience and presence of disincentives; patients' inability to afford medication; and lack of training in smoking cessation skills. Overarching these specific barriers were key themes of a medical and societal hierarchy, which undermined the FP role, stretched resources and constrained care.

CONCLUSIONS:

Many of the barriers described by the Romanian FPs reflected universally recognised challenges to the provision of smoking cessation advice. The context of a relatively hierarchical health-care system and limitations of time and resources exacerbated many of the problems and created new barriers that will need to be addressed if Romania is to achieve the aims of its National Programme Against Tobacco Consumption.

OP-119**Relationship of Decisional Balance and Self-efficacy in Obese and Overweight Patients in Dokuz Eylul University Faculty of Medicine in Izmir in Turkey**

Tugba Onat, Dilek Guldal

Department of family medicine, Dokuz Eylul University, Izmir, Turkey

In order to prevent obesity, it is crucial to change behaviors of eating and exercising. The process of changing behavior is difficult and various health belief models are used to explain the process. One of the widely used models, Transtheoretical Model (TTM), identifies the changing process through five steps: pre-intention, intention, preparation, action and maintenance, assuming increasing in self-efficacy and decisional balance in every step. Our study aims to investigate the relationship between stage of change with self-efficacy and decisional balance.

METHOD:

Our cross-sectional analytic study was done among adult individuals who had a Body Mass Index of 25 or higher. Besides the stage of change of the participants and demographic features, all participants received self-efficacy and decisional balance scales.

The data analyzed in SPSS 15 program and descriptive analysis, chi square, student-t and correlation tests are applied.

RESULTS

The ratio of people in action stage were higher among the women and among the ones who exercise than men and people who do not exercise ($p=0.000$, $p=0.032$); and no relationship with educational level, employment status, smoking, alcohol consumption or comorbidity diseases were found. A significant relationship was found between stage of change of participants and self-efficacy and decisional balance. It was found out that the ones who are in action stage have higher self-efficacy scores than the ones who are in intention and pre-intention stages ($p=0.000$); also negative scores in decisional balance are higher with the ones who are at pre-intention stage ($p=0.000$), and the positive scores are higher with the ones at action stage ($p=0.030$).

CONCLUSION:

A significant relationship was identified between the action stage of obese people with positive decisional balance and a high level of self-efficacy. This conclusion must be taking into account for any possible intervention.

Keywords: obesity self efficacy decisional balance stage of change

OP-120

Knowledge, Attitudes and Behaviors of Primary Care Clinicians About Periodic Health Examination Issues in Primary Health Care

Sinem Aydemir, Altuğ Kut, Fisun Sözen, Gökhan Eminsoy, Zeliha Özbakır
Department of Family Medicine, Baskent University, Ankara, Turkey

AIM: The goal of periodical health examination (PHE) is decreasing mortality and morbidity rates of people by identifying their risk factors and early symptoms of their curable diseases when they are asymptomatic. Family physicians have an important role with health counseling and early diagnosis of diseases due to their significant position in the primary care practice. There were no comprehensive study in Turkey to evaluate the knowledge, attitude and behavior of primary care clinicians in our country regarding PHE. The purpose of this study is to identify the knowledge, attitudes and behaviors of primary care clinicians about PHE.

METHOD: A stratified sampling method was used to select 629 family physicians from 7 geographical regions of Turkey. A questionnaire consisted of 29-questions was administered to family physicians to evaluate descriptive features, knowledge, attitudes and behaviors of primary care clinicians.

RESULTS: The mean age of family physicians was $41,91 \pm 7,81$ (27-66), 58,2% were men, 87,6% were married, 82,5% had at least one child. 19,4% of family physicians were family physicians specialist. 37,4% of them stated that they were educated about PHE and 55,3% of them have practiced PHE to the patients. PHE practice ratio was 4 times more in family physician specialist than others. When evaluating total knowledge, attitude and behavior questions family physicians in the Marmara region significantly gave correct answers than family physicians in the other regions. According to the logistic regression analysis, the only significant factor affecting the status of periodic health examination practice was being family medicine specialist.

CONCLUSION: According to the data gathered, family physician specialist had better knowledge, attitudes and behaviors than other family physicians. Supporting all family physicians, specialist or not, with screening tools which are standardized and relevant to community health needs, would ease performing PHE and make the primary care services better and sustainable.

Development counselling services on healthy nutrition and physical activity for primary health care workers in combating obesity

Nazan Yardım, Sabahattin Kocadağ

Public Health Institution, Ministry of Health

Turkey Nutrition and Health Survey was conducted by our Ministry (2010) the prevalence of obesity has been found 30.3% and 20.5 % in male and 41% in women over the 19 years old. Development of national action programs is recommended by WHO for prevention and control of NCDs.

One of the areas of intervention area is to take the necessary measures in primary health care services in Turkey Healthy Nutrition and Physical Activity Program (THNPA). In this context, a guideline has been developed for family physicians. In line with aim is to raise awareness of family doctors; to give consultancy about on healthy nutrition and physical activity by family health staff to the obese and overweight patients and also to contribute to the development of healthy eating habits.

A guideline was prepared for family physicians according to the THNPA Program by MoH. and distributed to all family physician. Information brochures were prepared in the basis the guideline to help them and family health staff. A inservice training will hold for family health stuff in the province by public health center.

Family health staff will make patient's height, weight, BMI and waist circumference and will be entered into the database before meeting with family physician; They will query dietary habits and physical activity status and will refer to the family physician.

Family physician will give walking program and healthy eating advice through out obesity and cardiovascular disease if not in the referral criteria according to the family physician guideline. They will also continue to follow for obese and overweight patients. In collaboration with dieticians in public health centers.

Insufficient data entry will be prevented with counselling services programme. It will be given counselling service which is very important in the combating obesity.

Keywords: primary health care, obesity, physical activity, counselling

Low levels of vitamin D in nicotine dependence: May vitamin D replacement be useful in the treatment of nicotine dependence

Tijen Sengezer¹

¹Numune Research and Training Hospital, Ankara, Turkey

²Department of Psychiatry, Numune Research and Training Hospital, Ankara, Turkey

³Department of family Physician, Numune Research and Training Hospital, Ankara, Turkey

⁴Department of Family Physician, Katip Çelebi Üniversitesi Atatürk Eğitim ve Araştırma Hastanesi, İzmir, Turkey

⁵Department of Psychology, Üsküdar University, İstanbul, Turkey

"AIM: To evaluate vitamin D levels in individuals admitted to our hospital's "smoking cessation unit" and accordingly, to investigate the relation of vitamin D levels with tobacco dependence.

MATERIAL-METHOD: 72 cases between ages of 17-69 referring to smoking cessation unit were included in our study. Retrospectively; demographic data form the patients' files, Fagerström Test for Nicotine Dependence (FTND), Beck Anxiety Inventory Questionnaire (BAIQ), Beck Depression Inventory (BDI) forms were examined and levels of vitamin D were recorded. Whether the parameters conform the normal distribution or not is evaluated by Kolmogorov-Smirnov test. In statistical analyses; Mann-Whitney U test, Kruskal-Wallis H test, One way ANOVA were applied. $p < 0.05$ level was accepted as statistically significant.

RESULTS: Mean age of the cases was $46,5 \pm 12,3$ (17-69) years, 36 of them (50%) were female. The average years of smoking was $25,6 \pm 12,0$ (1-50) years, average daily cigarette use at admission was $21,1 \pm 9,7$ (2-60), average score of FTND was $6,2 \pm 2,4$ (1-10). A statistical significance was determined among sex groups by means of vitamin D levels ($p=0,003$). A low but statistically significant and inverse relation has been observed between vitamin D

levels and BDI score ($p=0,007$, $r= - 0.374$). Considering the year of smoking, height, weight, age, score of FTND and BAIQ; no statistical significance has been determined between these variables and vitamin D levels.

CONCLUSION: Tobacco use has a relation with low levels of 25(OH)D. Therefore, the evaluation of vitamin D levels in the routine examination of tobacco consumers, replacement of vitamin D if there is any deficiency and their exposure to daylight will be beneficial."

Keywords: tobacco, nicotine, vitamine D, smoking

OP-123

One day with your doctor: a pilot lifestyle intervention lead by General Practitioners

Martin Sattler¹, Raquel Gomez Bravo², Claus Voegele³, Monique Aubart⁴, Marie Barth⁵, Max Haag⁶

¹Martin Sattler Family physician, Luxemburg, Luxemburg

²Raquel Gomez Bravo, Family Physician, Luxemburg, Luxemburg

³Prof. Claus Voegele, Department of Psychology University of Luxemburg, Luxemburg

⁴Monique Aubart, Family physician, Frisange, Luxemburg

⁵Marie Barth, Family Physician, Mamer, Luxemburg

⁶Max Haag, GP trainee at University of Luxemburg, Luxemburg

Background & AIM: General Practitioners (GPs) typically promote lifestyle changes such as modifications in dietary habits, smoking, alcohol consumption and physical activity. According to the literature, brief interventions carried out by GPs can be effective.

The aim of this project was to improve the quality of the doctor-patient relationship and to enable GPs to function as role models, thereby empowering them to better promote behavioural changes.

METHOD: A pilot project was run on the World family doctor day (19 May) in Luxembourg, which involved a lifestyle intervention including doctors and patients, physical activity (Nordic Walking, Jogging), cooking and eating together.

The invitation was sent 1 month in advance by post to all GPs, shared by email and social Media with students, GP trainees and junior doctors. Patients were directly recruited by their doctors.

After the intervention, a brief survey was completed.

RESULTS: All 10 participants reported to be very satisfied. There were 6 male and 4 female participants (3 Doctors, 1 physiotherapist, 6 patients). The mean age was 50.5 years and the mean BMI 23.31 kg/m². Participants reported a mean frequency of engaging in physical activity 4.8 times/week, with a mean duration of 6.5h/week. They also reported to have on average 3 meals/day, consuming fruits and vegetables 3.8 times/day. Participants were used to cook at home (1.2 times/day) and eat in restaurants 2.8 times/month; only 20% indicated to eat fast food once a month. The majority of participants (80%) stated not to have been dieting in the past, with the remaining 20% specifying a low carbohydrate diet, restriction of alcohol, coffee, tea and smoking cessation.

CONCLUSIONS: Promotion of lifestyle changes could be even more successful, if GPs adopt a healthy lifestyle themselves. By doing so, they are in an advantageous position to become "role models" and encourage behavioural changes in their patients.

Keywords: lifestyle, exercise, nutrition

The effects of menopausal symptoms in climacteric women on marital adjustment and sexual life

Zeynep Can Turhan¹, Fatma Goksin Cihan², Ruhusen Kutlu², Samil Ecirli¹

¹Konya Training and Research Hospital

²Konya Necmettin Erbakan University Meram Medical Faculty

Background and AIM: This study aims to evaluate the effects of menopausal symptoms in climacteric women on their marital adjustment and sexual life.

METHODS: In this cross-sectional study; socio-demographic data form, Menopause Symptom Rating Scale (MSRS), Marital Adjustment Scale (MAS) and Arizona Sexual Experiences Scale (ASEX) were applied to 400 married, climacteric women.

RESULTS: The mean age of participants was 50,2±6,47 and entering menopause age mean was 46,0±5,29. 46.2% of the participants (n=185) were under the age of 49. The averages of MSRS-SS (Somatic Symptoms) ($p<0,001$) and MSRS-US (Urogenital Symptoms) ($p=0,008$) scores of 49 years old and older women were significantly higher. The average of MSRS-SS scores of working women was statistically significantly higher ($p=0,015$). The averages of MSRS-SS ($p<0,001$), MSRS-PS (Psychological Symptoms) ($p=0,003$) and MSRS-US scores ($p=0,016$) of women with chronic diseases were statistically significantly higher. The mean of MSRS-US scores of exercising women was statistically significantly lower ($p=0,028$). The mean of MAS scores of women whose educational levels were primary school or below was statistically significantly higher ($p=0,001$). The mean of MAS scores of women who married by falling in love was statistically significantly higher ($p=0,027$). The mean of ASEX scores of women who were 49 years old or older was statistically significantly lower ($p=0,024$). While the mean of MAS scores of women with high menopausal symptoms was statistically significantly low ($p=0,001$); their mean of ASEX scores was statistically significantly high ($p=0,001$). The mean of ASEX scores of women with higher MAS scores was statistically significantly low ($p=0,001$).

CONCLUSIONS: Menopausal symptoms are identified as a problem closely concerning marriages and sexual lives of climacteric women.

Keywords: Climacteric period, marital adjustment, sexual life.

OP-125

Hormone replacement therapy of menopause (HRT) prescribed by young general practitioners in Gironde (France): knowledges, attitudes and practices

Shérazade Kinouani, Paul Nalet, Sylvie Duhamel, Jean Louis Demeaux

Department of general practice, University of Bordeaux, Bordeaux, France

Background & AIM: in 2014, hormone replacement therapy of menopause (HRT) is the most effective therapy to treat climacteric syndrome who alters the quality of life. Yet in the late 90s (the time of publication of the first results of the US study WHI), there has been a significant decline in France of his prescribing by gynecologists and general practitioners (GPs). Young doctors started their medical training when HRT has been widely criticized and today, the therapeutic benefit/risk ratio remains controversial. The aim of this study was to describe the knowledges, attitudes and practices of young GPs about HRT.

METHOD: an online cross-sectional survey was achieved in 2014, using a self-administered questionnaire. Locum GPs enrolled in an online forum in department of Gironde (France) were interviewed. Data were weighted during descriptive analysis.

RESULTS: 77 locum GPs were interviewed. The response rate was 14.6%. Locum GPs were not opposed to the prescription of HRT: the frequency of prescription was 61.6%, mainly by renewal. They were 8.7% to initiate it. Reluctances were reported in 62.2% of cases but they did not influence the prescription of HRT. Personal factors influenced weakly the prescription of locum GP. The proportion of prescription was more important if the practice of gynecology was more usual. A complementary training in gynecology was not associated with a greater frequency of prescription but was linked with a greater frequency of HRT cessation.

CONCLUSION: despite expressed reluctances and unclear scientific data, locum GPs remained in an "evidence-based medicine" approach about HRT, in compliance with known indications or contraindications.

Keywords: menopause, hormone therapy, locum general practitioner

OP-126

Ask women "family history of breast cancer" for person-centered approach of screening

Mehtap Kartal¹, Nilgun Ozcakar¹, Sehnaz Hatipoglu², Makbule Neslisah Tan¹, Azize Dilek Guldal¹

¹Family Medicine Department of Dokuz Eylul University, Izmir, Turkey

²Ministry of Health, 24th Family Health Centre, Izmir, Turkey

Background & AIM: Screening recommendations of physicians are important for women to raise awareness about their risk factors, and to promote appropriate screening behaviors. However, it seems challenging for primary care physicians (PCPs) balance between disease prevention and diagnosis-treatment. The aim was to describe physicians' breast cancer consultancy practice including family history, cancer prevention issues for the women they care.

METHOD: Data were collected as part of a cross-sectional survey about breast cancer risk factors, different risk perception measures, and screening behaviors of women. During face-to-face interviews 577 women completed the questionnaires. For breast cancer risk prediction, 5-year risk score ≥ 1.67 in Gail model, was considered as "increased risk".

RESULTS: Among women 49.9% reported that they visit PCPs for an annual examination during the year, and 36.1% had first degree relatives with cancer while 7.3% with breast cancer. According to Gail score 22.4% of the women were in increased risk group. Among cancer and breast cancer related characteristics of the women only a positive family history of first-degree relative with breast cancer was statistically significantly more in increased risk group ($p < 0.001$).

Although PCPs, compared to other physicians, asked more about family history of cancer ($p < 0.001$) and informed more about cancer prevention issues ($p < 0.001$) the women who visited them for annual examination, still they didn't ask 64.9% of these women their family history of cancer and didn't inform 73.6% about cancer prevention issues.

CONCLUSIONS: For PCPs cancer still seems to be a hard issue to discuss even with women visiting them for annual examination. Asking first degree relative with breast cancer can give PCPs the chance of determining women with increased risk, and support women's appropriate understanding of their risk in relation to their family history. This can support shared-decision making for the development of person-centered approach for breast cancer screening.

OP-127

Vaginal Estrogens for treatment of vaginal atrophy: An evidence based review

Ana Margarida Pinho, Célia Gomes Silva

ACES Entre Douro e Vouga I Feira/Arouca, USF Famílias, Lourosa, Santa Maria da Feira, Portugal

Background & Aim

Vaginal atrophy or atrophic vaginitis, is an inflammation of the vagina due to the thinning, drying and shrinking of the tissues. Genital symptoms include dryness, soreness, irritation, discharge and dyspareunia. These symptoms are due to a lack of the estrogens and are more often after menopause.

Atrophic vaginitis has a negative impact on patient quality of life and sexual health. With early identification, treatments can improve these symptoms and reverse the physical changes.

The aim of this study is to review the available evidence on the efficacy of vaginal estrogens in the treatment of vaginal atrophy.

Method

A search for clinical practice guidelines, meta-analysis, systematic reviews, evidence-based reviews and clinical trials published between January 2010 and March 2015, in English, Spanish and Portuguese was performed using the MeSH terms: atrophy and estrogens. The Strength of Recommendation Taxonomy scale of the American Family Physician was used to assess the quality of the studies and the strength of the recommendation.

Results

Of the fifty articles found, only six fulfilled the inclusion criteria and were selected. These included three guidelines, two systematic reviews and one randomized controlled trial.

The guidelines recommended vaginal estrogens for treatment of vaginal atrophy in postmenopausal women. The systematic reviews found that vaginal estrogens effectively relieve common vulvovaginal atrophy-related complaints. The randomized controlled trial concluded that treatment with vaginal estrogens for 12 weeks improve sexual function in postmenopausal women with symptoms of vaginal atrophy when compared with a placebo.

Conclusions

Evidence from available studies suggests that local vaginal estrogen therapies are effective in relieving symptoms of vaginal atrophy (Strength of Recommendation B).

More studies are needed to establish tolerability of vaginal estrogens as well as the efficacy relative to other therapies.

Keywords: Atrophy; Vagina; Estrogens.

OP-128

Evaluation of Marital Adjustment And Psychosocial State Of Couples Undergoing Infertility Treatment

Sule Erayman¹, Fatma Goksin Cihan², Mustafa Basaran³

¹Family Medicine Clinic, Konya Training and Research Hospital, Konya, Turkey

²Department of Family Medicine, Necmettin Erbakan University, Meram Medical Faculty, Konya, Turkey

³Obstetrics and Gynecology Clinic, Konya Training and Research Hospital, Konya, Turkey

Background and AIM: Infertility treatment is a stressful and anxious course for attendant couples. During this process, both husband's and wife's stress level and interrelation may be adversely effected. This study is planned for investigating anxiety and depression symptoms due to infertility and probable problems in marital adjustment of infertile couples.

METHODS: In this analytical cross-sectional study, 101 infertile couples who admitted to Konya Training and Research Hospital IVF Center from July 2014 to January 2015, were included. A sociodemographic questionnaire, Marital Adjustment Scale (MAS), Beck Anxiety Inventory (BAI) and Beck Depression Inventory (BDI) were fulfilled by the participants.

RESULTS: The mean age was 28.0±4.8 for women and was 31.1±5.7 for men. BAI scores were found significantly higher in women (9.8±8.0) than men (7.2±9.2) (p=0.001). Similarly, BDI scores were significantly higher in women (p<0.001). There wasn't any significant difference between MAS mean scores of men (47.2±7.1), and women (48.9±6.0) (p=0.157). BAI scores were higher in 19.8% of women and 12.9% of men (p=0.183). According to BDI scores, 23.8% of women, and 8.9% of men had depression (p=0.004). MAS scores were low in 26.7% of women and 23.8% of men (p=0.627).

CONCLUSIONS: Infertility treatment may not lower the marital adjustment; it may bond couples to each other. The treatment process brings serious physical and emotional burden for couples, especially for the woman. Couples who have experienced physical and psychosocial problems about infertility treatment need health professionals' support. This support is important for couples' attendance to treatment, success of the treatment by raising the pregnancy rates, and public health.

{Assesment of Postpartum Depression Using The Edinburgh Postnatal Depression Scale In Fathers of The Children Born at Ankara University School Of Medicine Department of Obstetrics And Gynecology }

Gülşen Ceyhun Peker, Ayşegül Cömert Okutucu, Ayşe Selda Tekiner, Zehra Dağlı

Department of Family Medicine, Ankara University School of Medicine, Ankara, Turkey

Background and AIM: The aim of this study is to determine the rates and risk factors of post-partum depression in fathers.

METHODS: The study was carried out with 252 fathers who agreed to participate, at Ankara University School of Medicine Department of Obstetrics and Gynecology between April and June 2013. Two interviews were conducted; first at childbirth, and second at 6th week post-partum. Paternal depression was assesed with Edinburgh Postnatal Depression Scale (EPDS), Hamilton Depression Rating Scale (HAM-D) and Socio-demographic Questionnaire. We used a cut-off score of greater than 13 for EPDS.

RESULTS: Depression rates in fathers assesed with EPDS at 6th week postpartum was 5,6 %. Mean EPDS scores in the first and second interviews were 5,35± 4,29 and 5,85± 4,08 respectively. Factors that have an increasing effect on EPDS scores were determined as: Number of children, number of individuals living with the family, history of psychiatric disorders, unplanned pregnancies, marital conflicts and lack of social support. Fathers with higher incomes and/or without gender expectations scored significantly less on the EPDS.

CONCLUSION: Fathers should also be screened and if needed referred for postpartum depression especially in primary care. Further research with larger samples is crucial to determine the risk factors and screening policies as this could represent an important opportunity for public health intervention.

Keywords: Fathers, Depression, Postnatal

OP-130

Infertility and Biopsychosocial Approach

Ferhat Ekinci¹, Bilge Turgut², Dođukan Ali Angın³, Tefvik Yoldemir⁴, Arzu Uzuner²

¹Department of Public Health Directory, Van, Turkey

²Department of Family Medicine, Marmara University, İstanbul, Turkey

³Department of Obstetrics and Gynecology, Bigadiç Public Hospital, Balıkesir

⁴Department of Obstetrics and Gynecology, Marmara University, İstanbul, Turkey

AIM: Infertility is a life event that can cause psychopathological changes in women. The aim of this study was to evaluate depression, anxiety, loneliness and social support in infertile women.

METHOD: The female infertile patients who applied to the Marmara University Department of obstetrics and gynecology outpatient clinics were recruited in this study. All participants have been asked to fill Hamilton anxiety scale, Beck depression scale, University of California Los Angeles Loneliness Scale and Multidimensional Scale of Perceived Social Support-MSPSS.

RESULTS: A total of 141 infertile women; mean age value was 28.8 ± 4.7 ; mean marriage year was 5.7(1-18). Of the participants 16.3% were working. The infertility type was 79% primary, 21% secondary; median time of being infertile was 4.2(1-15) years. Men infertility rate was 10%, idiopathic infertility rate was 66%. The rate of the participants with previous treatment was 49.6%. Only three of the participants were taking psychiatric treatment. Nearly all of them were sharing their situation with their friends (92%). Seven percent of the husbands and 13% of their husbands' families showed incomprehension to the participants. According to Beck depression scale two participants and according to Hamilton anxiety scale 19 participants were referred to psychiatry clinic. Loneliness scale score was decreased with increasing year of marriage and monthly income ($r=0.32, p=0.004$; $r=0.23, p=0.006$). The loneliness scale score of whom living with her husbands' family were meaningfully higher than that of whom living only with their husbands ($p=0.010$). The social support increased with the increase of married years ($r=0.238, p=0.005$); there was no significant difference between year of marriage and perceived social support ($p>0.005$). Loneliness scale score was negatively correlated with perceived friend support and perceived family support ($r=-0.527, r=-0.373$) ($p<0.001$) and was positively correlated with anxiety and depression scale scores ($r=0.455, r=0.486$) ($p<0.001$).

DISCUSSION: Infertile women have less depression scale score than and nearly the same anxiety scale score with normal population. Family structure of the couple and social environment such as house, financial, physical conditions, social relations; affect loneliness scale score and perceived social support. Infertility is a clinical problem which should have been discussed by biopsychosocial approach.

Keywords: infertility, women, biopsychosocial approach

Women's mortality rate in reproductive age from cervical cancer in Goiânia during 2013

Gustavo Aguilar Alvarenga Amorim, Natália Carasek Matos Cascudo, Lara Louise Guimarães Silveira, Ana Luísa Franco Moura, David Carvalho Rezende, Wallace Pinheiro Rodrigues, Lorena De Almeida Ribeiro Prudente, Vinícius Bernardes Mendonça Damasceno, Natália Jácomo Auad, Davison Rodrigues Lima Oliveira, Camila Garcia De Souza, Ayssa Teles Abrão Trad, Thiago Pimenta Alves
School of Medicine, Federal University of Goiás

BACKGROUND & AIM

This study is relevant because contributes with epidemiological data of mortality that may help elucidate which measures should be taken to decrease the death rate of women in reproductive age. The aim is to analyze the mortality rates from cervical cancer in the city of Goiânia among women in reproductive age during 2013.

METHOD

Cross-Sectional study using mortality data from cervical cancer, among women between 10 and 49 years old, during the year of 2013, in the city of Goiânia (state of Goiás, Brazil). The data was obtained from the Health Information Division of Goiânia's City Health Department (which provided information from the death certificates) and also women global mortality rates in Goiânia, available on the Database of SUS (DATASUS). The data collected was managed with Microsoft Excel 2010.

RESULTS

It was found that the death numbers from cervical cancer in Goiânia during 2013 among women in fertile age was 13, which represents around 2,76% of women global death rate in the same age group, throughout the same year in the city. It was also verified that cervical cancer represented 15,1% of the total amount of women who died from cancer at the location, which was the second higher level, staying behind only from breast cancer.

CONCLUSIONS

Cancer had a high mortality rate among women in the researched group and cervical cancer played a special role, being responsible for the second higher number of deaths. The challenges involved in the struggle against cervical cancer must be overcome. Changing this setting requires deeper intervention measures such as improving the extent of the Pap smear test. In addition, educational measures from the health professionals to the general public should be strengthened, emphasizing the importance of prevention and early treatment.

Once upon a time the COPD knowledge and prevention for children of 8 years (children´s story)

Lazaro De Castro Peral¹, Ana Cristina Menéndez López², Juana Jiménez Martínez³, Javier Arnés Acevedo², Francisca María Aceituno Villalba², Laura Ubeda Cuenca², María Dolores Bosque Mata², Sonia Falla Jurado², Alicia Sánchez Martínez², Alvaro Ruiz Risueño Montoya²

¹San Pedro del Pinatar Health Centre

²San Javier Health Centre

³Torre Pacheco Health Centre

BLACKGROUNDS AND AIMS:

This work is part of a series of studies aimed at Prevention and health education, which includes family, teachers and health professionals to aid in a prevention culture. For students in third grade school Las Claras del Mar Menor, we wrote a story about a great grandfather, "The World's Best Grandfather" who had COPD, which defined the disease, and described its symptoms, treatments and prevention measures. Then we asked several questions to see if they had learned anything from the story. We also wanted to know of any interest in students becoming doctors in their own future, as we had also asked to other primary age groups.

METHOD:

Cross-sectional study carried out on the total students in third grade (79). Questionnaire of 12 items. Statistical Analysis T-student, G-STAT 2.0 software, considered significant at $P < 0.05$.

RESULTS:

Sex: female 50.63 %, 49.37 % male, showed interest in becoming a doctor when they grow up 44.30 % (66.66 % girls and 33.34 % boys). Very good results in the test: 95.30 % correct. Regarding knowledge about COPD, definition, causes and symptoms: 97.47 % responded correctly after reading the story. Treatment: Correct inhalers 87.34 %, smoking cessation: 96.20 %. Relationship vaccine / illness 91.14 %. Reported having spoken of smoking in class 82.28 %, 83.54 % at home. From now on 97.47 % of children will remember advice to not smoke or drink alcohol.

CONCLUSIONS:

1. - Promoting healthy habits from childhood, avoiding future addictions.
2. -. Giving children advice from parents about the risks of tobacco and explaining the benefits (breath, white teeth, no odors at home / car, fewer colds, saving money and, above all, to continue playing).

Sexuality Workshop: experience in a public school of a brazilian underserved area

Ana Rosa Murad Szpilman, Erivelto Pires Martins

Department of Public Health, Vila Velha University, Vila Velha, Brazil

BACKGROUND & AIM

A Sexuality Workshop was organized by the Vila Velha University Medical School Students, in a elementary education public school, in Espírito Santo State, in Brazil. It aimed to discuss and problematize with teenagers about sexuality, in order to reduce the teenage pregnancy.

METHOD

Reading and documental research on sexuality by the medical students were the first steps. Afterwards, the students contacted the school principal, pedagogues and teachers to present the workshop project. The workshops were based on the Conversation Circle Method, shared learning, in a group, facing each other, in order to collectively build knowledge. On october 2014, it was conducted, by the medical students, four recreational-pedagogical workshops with 133 eight grade teenagers, from 14 to 17 years old, with a qualitative and dynamic approach, exploiting data related to the individuals life experiences. The medical students determined the discussion themes based on the teenagers questioning: puberty and gender relations; Pregnancy Puerperium Cycle, Teenage Pregnancy and Contraceptive Methods; STD/AIDS prevention and Sexuality and Media. In order to guide the discussion, audiovisual materials were used: movies, images and photographs.

RESULTS

Considering subjective criteria, the students evaluation, demonstrate the intervention plan effectiveness, based on the teenagers speeches, such as: "now I understand", "Oh, so that how it is!", "Got it!", among others. The principal, pedagogues, teachers and employees were implicated, promoting reflections and discussions among them. It was not possible to involve the parents at this moment - the next research step focus.

CONCLUSIONS

The sexual orientation theme is extremely important, inherent to life, justifying its inclusion in the academic curriculum. It is expected that teenagers think about their behavior, learn about sexuality by understanding their bodies, use contraceptive and preventive methods decreasing the teenage pregnancy and the sexually transmitted diseases, reflecting and changing their attitudes.

The Opinions of the Family Medicine Specialists Who Work in Family Health Centers in Ankara about the Training of Family Medicine Residents

Fulya Cesur Yağız, Metin Canbal, Sevsen Cebeci

Department of Family Medicine, Turgut Ozal University, Ankara, Turkey

OBJECTIVE: The objective of this study is to determine the opinions, perceptions and tendencies of the family medicine specialists about prospective family health centers employed for resident's training and the contribution process of the family medicine specialists to the residents concerned.

MATERIALS-METHOD: This study employed a descriptive research type. The universe of the study is 104 family medicine specialists who work in family health centers in Ankara. 84 of these family medicine specialists were reached by the researcher's phone calls, took their consents and sent the questionnaire concerned to the participants. The participation was voluntary and 40 of the 84 family medicine specialist returned the questionnaire and e-mailed back. The return rate of the questionnaire is 47%. The obtained data were analyzed in terms of frequency, correlation between variables and statistical differences, and then the findings were discussed. The qualitative data, on the other hand were analyzed by means of descriptive analysis.

FINDINGS: The participants seemed to be positive about training of the residents by specialist family physicians and they found it useful. They were found to be eager to share their knowledge and experiences but they indicated the difficulty of workload and patients' number. However, they had a self-confident and motivated profile in terms of working as a trainer in family health centers.

CONCLUSION: The information and awareness of the family medicine specialists should be enhanced and their workload and working hours should be revised.

In-service training for family doctors: Croatian experience

Mladenka Vrcic Keglevic¹, Hrvoje Tiljak²

¹Mladenka Vrcic-Keglevic, Foundation for the Development of Family Medicine in Croatia, Zagreb, Croatia

²Hrvoje Tiljak, University of Zagreb, School of Medicine, A. Stampar School of Public Health, Department of Family Medicine, Zagreb, Croatia

Background & aims

Vocational, speciality training for family doctors (FD) in Croatia started in 1960. But, it has always been possible to work as a FD without ST. Facing the process of joining the EU, ST was intensified by the Project: "Harmonisation of Croatian Family Medicine with European standards introducing speciality training". The Project started in school year 2003/04 and the main aim was that all working family doctors (FD), younger than 50-years, should finish ST until 2015. Because that more than 1.500 FD are waiting for ST and many of them are experienced, the three ST schemes were introduced: Program A, full program for young doctors, Program B, partly in-service and Program C, almost completely in-service ST. All of them should pass the same type of final exam. The aims of this study were to investigate how many trainees and from which programmes finished ST during the period of nine-years.

Methods

The data on the number of trainees due to the ST programmes were obtained from the archive of Department of Family Medicine, Zagreb Medical School, and the organiser. The number of specialists in FM was obtained from the Croatian health statistic yearbook.

Results

During the nine-year period, 751 trainees finished ST, while it was planned to involve 1350 of them, 55.6% of achievement. The best results were achieved in the in-service Program C, 83.3% of planned number, than in Program B, (52.2%), and the less in Program A, only 50.0% of planned number. The percentage of speciality

trained FD in Croatia increase in almost 20%; in some Counties more and in others less.

Conclusion

The results clearly indicated that the best results are achieved at in-service Program C. Our experience in in-service ST could help those countries with a large numbers of FD not having ST.

OP-136

Community-teaching-service Interaction: analyses on Medical Education effects

Ana Rosa Murad Szpilman, Maria Elizabeth Barros De Barros

Department of Education, Espirito Santo Federal University, Vitória, Brazil

BACKGROUND & AIM

This ongoing research focuses on medical education politics and its dimensions, indicating an urgent need to change the methodology, its curriculum frameworks, in order to graduate doctors, who experience during its graduation process a public dimension in doctors-patients relationships. It was analyzed if the inclusion of medical students in Community-teaching-service Interaction Programs produce practices that emphasize a public dimension in doctors-patients relationships, creating a bond helping in the process of delivering health care.

METHOD

It was analyzed the medical educational process, based on the effects of Community-teaching-service Interaction programs over students conceptions and practices. The subjects interviewed were the program teachers and medical students, and public health unities users and professionals, where the students' internship happens.

PRELIMINARY RESULTS

As a result, from this early and continuous contact with these unities a series of changes and achievements in the teaching, with the team and community, and in the future doctor's formation were accomplished. It's notorious and evident the actualization, study and research demand by the team, conquered through the contact with the student. The community reports that the contact with the student provides a distinguished attention. To the student is enabled a contact with real daily situations connected to the medical practice and a formation towards the public health system, a working market possibility. Furthermore, the professionals graduated in this context, acquire a wider vision of a humanized attention in multidisciplinary team, discerning indistinctly each health categories row and their possible contributions.

PRELIMINARY CONCLUSIONS

Up to now, by analyzing the data already collected, we can infer that Community-teaching-service Interaction Programs may be the solution to graduate doctors who will assist their patients in a way that we will have more possibility to succeed with better lifestyle choices, improvement in treatment adherence and prevention on some chronic diseases worsening.

Keywords: Undergraduate Medical Education, Public Health, Delivery of Health Care.

Childcare

The students with the health workers in the public health unity participate on the delivery of health care for the assisted groups, like childcare.

Children's Day Party at the community assisted

The students participate in a variety of activities in the community assisted with the health workers. This is a Children's Day Party at the community assisted.

Educational Activity at Public School

The students perform activities, clinical and educational, on the public schools with the health care workers in the community assisted.

Intelligent Map

The students use a range of tools to help organizing the delivery of health care by the health workers in the community assisted. This is the Intelligent Map.

OP-137

What does the Hippokrates and Conference exchanges participants think about their experiences?

Juan María Rodríguez Martínez¹, Raquel Gómez Bravo², Anna María De Pedro Pijoan¹, Enrique Álvarez Porta¹, David Bottaro Parra¹, Ignacio Borque Roda¹, Adriana Helfmelt Minobis¹

¹SEMFYC

²Vasco da Gama Movement

Background & AIM:

The VDGM Hippokrates, 10 years old program, allows GP trainees and Junior GPs to discover Primary Care in different countries. One of the most popular exchanges is the Conference Exchange, of one week duration, organized in the context of a Congress.

The aim of this project was to collect information of those who took part in them.

METHOD:

A self administered questionnaire was sent online during 2012 to 2014 to all the colleagues who took part in a Spanish Conference Exchanges or Spanish colleagues who took part abroad. 66 answers were collected. Items: profile, likes and dislikes, ratification of the organization, accommodation, feedback in their own country and information to improve the program.

RESULTS:

Age: 25 to 40, mostly female. Countries: Portugal, France, Israel, Italy, Turkey, Romania, Latvia, Czech Republic, Austria, Netherlands, Poland, Croatia, UK, Spain and Ukraine. They receive the information through email or Facebook.

All of them recommend the experience.

The majority didn't receive any fund, but the organizing country offered free inscriptions to attend and most of them value with high standards the organization. Accommodation was provided by GP trainees and Junior GPs.

Even if the language it could be a barrier in some cases, the communication was effective and they liked the most to see how other GPs work and share their own experience. The short length of the exchange was a common complain and they suggested to add more activities in English to improve the program.

A high amount of them answered that they will share their experience back in their countries.

CONCLUSIONS:

Conference exchanges are very well evaluate and recommend and it is a magnificent way to spread the importance of Primary Care, to enrich the professional development and it should be consider part of the curricula.

Care Pathways Project - Training in mental health for Community Health Agents and Auxiliaries nursing technicians/ Brazil

Edelves Rodrigues, Renata Pekelman

Health Technological Education and Research Center/ GHC School-Hospital Conceição's Group, Porto Alegre, Brazil

Background and AIM: The Care Pathways project is one action of the national plan "Crack can be conquered" on the responsibility of the Ministry of Health, in partnership with the Oswaldo Cruz Foundation (FIOCRUZ) / RJ, Conceição's Hospital Group (GHC) / RS and Federal University of Rio Grande do Sul (UFRGS), Brazil. It involves the relationship between institutions of the National Health System/SUS, SUS Technical Schools (SUSTS), areas of Mental Health and Primary Care of the three federal entities and the Boards of Municipal Health Secretaries (COSEMS). Aims to provide training for all Community Health Agents (CHA) in Brazil and one auxiliary nurses (AN) for each family health team in mental health with emphasis on crack, alcohol and other drugs, totaling 290,760 students. **METHODOLOGY:** It's organized through a conductor Group, an Executive Coordination for its operation and implementation and Coordinations of Infrastructure, Communication, Academic, Educational and macro-regional. The latter articulated in 05 country's regions, ETSUS, COSEMS, Departments of Primary Care and Mental Health of States and support 27 States teams that articulate and execute the courses to CHA / AN. Counselors and tutors were selected among the SUS workers of Primary Care, Mental Health, trained and accompanied by educational coordination. **RESULTS:** Care Pathways started in May 2013 and to date has produced two educational materials, formation of 187 counselors, 2200 tutors and 270,000 ACS/ATENf. **CONCLUSION:** assessments were positive, counselors, trained tutors and CHA / AN showed the need to broaden the understanding of the issue and make possible the creation of a new look for attention to mental suffering in Primary Care. **Conclusion:** It is essential the incorporation of its method and theme in the training of Community Health Agents and Auxiliary Nursing Technicians promoted by SUSTS and include the formation process of these technical content.

evaluation of medical students' attitudes towards the elderly

Hüseyin Elbi¹, Süheyla Rahman², Selim Altan³, Beyhan Cengiz Özyurt⁵, Sevnaz Şahin⁶, F. Sırrı Çam⁴

¹department of family medicine, celal bayar university, manisa, Turkey

²department of medical education, celal bayar university, manisa, Turkey

³department of medical ethics, celal bayar university, manisa, Turkey

⁴department of medical genetics, celal bayar university, manisa, Turkey

⁵department of public health, celal bayar university, manisa, Turkey

⁶department of internal medicine, division of geriatrics, aegean university, izmir, Turkey

AIM

In 2014, the seniors of Turkey reached to 8.0% of the population, increased from 6.7% in 2006. By 2050, it is projected that seniors will make up more than 20% of the population. Today, we should see the reality of an aging population begins to make itself felt especially in the economy and health care rather than think of it as a future phenomenon. The purpose of this study aims to evaluate the attitudes of medical students towards elderly at Faculty of Medicine of Celal Bayar University.

METHOD

This is a cross-sectional study carried out at Faculty of Medicine of Celal Bayar University in Turkey. Participants of the study were selected from 1070 medical students educated all classes of the faculty by stratified sampling.

Two surveys were carried out to assess students' attitudes toward the elderly and demographic questions were asked. The first was UCLA Geriatrics Attitude Scale designed to measure and compare primary care residents' attitudes towards older people. The second was Kogan's Attitude towards Old People Scale established to measure the attitudes of individuals towards older people.

RESULTS

There were 406 participants in the study. The age of the participants ranged from 18 to 27 years (mean 21.04 years); 60.8% of them were female. There were significant differences in the comparison of gender and classes for UCLA total score evaluation, but assessment of KOGAN total score there was significant difference for classes only ($p < 0,05$).

CONCLUSIONS

It was determined that the attitude toward the elderly was more positive for second and third classes; so a study program about the attitudes of students towards the elderly during the period of pre-graduation should encourage in the curriculum of the fourth and fifth years rotations where students studies at different outpatient and inpatient clinics.

OP-140

Impacts and assessment of a method recruiting General Practitioners' supervisors by using GP trainees in the Parisian Region

Emna Zarrad, Gladys Ibañez

University Pierre and Marie Curie - Paris 6

Background and Aim

A health system based on primary care is more efficient and more equal. (WHO 1978) General Practitioners (GP) are the corner stone in such a system. Discovering and learning Family Medicine in GP's practice is fundamental and recruiting GP's supervisors becomes a real challenge. The aim of the study is to propose and assess a recruiting GP's supervisors' method, and its impacts.

Method

Interventional comparative non randomised study has been lead between the 20/09/2013 and 1/10/2014 with GP working in Parisian region. Two interventions have been compared: a "gold standard" method where all GPs received a postal letter and a "sensitization" method towards GP trainees who should participate by contacting (themselves or through another person) a GP they know who could possibly be candidate on becoming a GP's supervisor. Illustrative video have been created to help convincing GP.

Results

Among the 7 Parisian medical universities, 5 of them accepted the intervention. GP trainees filled 293 questionnaires and 132 (51.9%) GP have been suggested. Among the 132 GP selected in the study, 113 (85.6%) have effectively been contacted. Twenty (15.2%) of them were interested on becoming GP's supervisors and have been referred to a university's contact. The rate of recruitment by this method has been highly superior to the one given by the gold standard method ($p < 0.0001$). The success of videos (>6000 views on YouTube) showed the necessity of such tools. A website has been created to gather all those information, in one and dedicated place: www.devenirmsu.com.

Conclusion

It is probably recommended to anticipate, assess and spread all GP' preceptors' recruitment's methods in order to know better the efficiency of our actions in that field and allow us to pool them.

OP-141

Family medicine training in Saudi Arabia: Are there any variations among different regions?

Kasim Mohammed Aldawood, Ammar R Abu Zuhairah, Amar H Khamis
University of Dammam

AIMS: The aim was to compare Eastern, Makkah, and Asir regions, and to assess various rotations based on residents' perception.

METHODOLOGY: This is a cross-sectional study. A questionnaire was developed by the investigator and validated by two experts. All residents, except R1 residents, were included. All data were collected by the investigator by direct contact with the residents. Statistical Analysis Used: Cronbach's alpha, analysis of variance, t-test, and univariate regression model as appropriate, were used. **RESULTS:** Reliability of the questionnaire was found to be 75.4%. One hundred and seven (response rate: 83.6%) residents completed the questionnaire. There were 51 (47.7%), 27 (25.2%), and 29 (27.1%) residents in the program in the Eastern region, Makkah, and Asir, respectively. The mean age was 29.1 ± 2.5 years; half of the residents were male, most of (83.2%) were married, and more than half (54.2%) of had worked in primary health care before joining the program. Overall, 45% of the residents perceived that they had achieved the training objectives. The highest rotations as perceived by the residents were psychiatry and otolaryngology while the lowest were orthopedics and ophthalmology. There were significant differences among the study regions with regard to the rotations in family medicine, internal medicine, orthopedics, general surgery, and emergency medicine. **CONCLUSIONS:** Overall, a good percentage of the residents perceived that they had achieved the training objectives. The rotations differed in the studied regions. Psychiatry and otolaryngology had the highest percentage of family medicine residents who perceived that they had achieved the training objectives while lowest was in internal medicine and obstetrics and gynecology. The highest rotations as perceived by the family medicine residents were psychiatry and otolaryngology while lowest were orthopedics and ophthalmology. Sharing of experience and further studies are needed to improve the program rotations.

Factors affecting Family Medicine residents perception of achievement of training objectives

Kasim Mohammed Aldawood, Ammar R Abu Zuhairah, Amar H Khamis
University of Dammam

AIMS: To measure the association between number of patient encounters and training provided to residents, as well as the residents' perceived achievement of training objectives. **Settings and Design:** This cross-sectional study was done on Family Medicine residents in Eastern province, Makkah and Asir regions. **MATERIALS-METHODS:** A questionnaire was developed by the investigator and validated by two experts. All residents, except first year residents, were included. Data were collected by the investigator through direct contact with the residents. **Statistical analysis:** Cronbach's alpha, analysis of variance, t-test, and univariate regression model were used. **RESULTS:** Reliability of the questionnaire was found to be 75.4%. One hundred and seven residents (response rate, 83.6%) had completed the questionnaire. The mean age was 29.1 ± 2.5 years, half of the residents were male, most of them (83.2%) were married, and more than half (54.2%) of the residents had worked in primary health care (PHC) before joining the programme. Age and duration of work in PHC before joining the programme were significantly and positively associated with the outcome. In Family Medicine rotations, continuity of care, percentage of patients discussed, and number of trainers were associated with the outcome. On the other hand, percentage of patients discussed in different settings and opportunity for the residents to evaluate patients in an outpatient setting were among the factors affecting the outcome in the hospital rotations. **CONCLUSIONS:** Factors identified (age, duration of work in PHC, discussion, and opportunity to evaluate patients) might help residents, trainers, and decision makers in ensuring residents benefit from the different rotations. Further studies to link the effect of the identified factors on resident outcome and patient care are required.

Balint 2.0: Bringing the World together through Virtual Balint Meetings for WONCA Doctors

Kyle Hoedebecke¹, Luis De Pinho Costa², Albert Lichtenstein⁴, Donald Nease, Jr.³

¹Wonca Polaris, Fayetteville, USA

²Vasco da Gama, Oporto, Portugal

³International Balint Federation

⁴American Balint Society

BACKGROUND: In September 2014, discussions emerged regarding an online international Balint initiative as a literature search did not produce any published results describing similar international web-based projects. Within hours of the initial post, a dozen representatives from the majority of the regional YDMs signed up to participate - namely the Vasco da Gama Movement, Polaris Movement, Waynakay Movement and The Spice Route. More recently representatives from AfriWon, the Al Razi Movement and The Rajakumar Movement have joined in. The group calls itself "Balint 2.0 Ambassadors": 2.0 references the application of technology while "ambassadors" touches on its international nature.

METHODS: 14 Representatives from all 7 WOCNA regions participating in monthly virtual meetings using Zoom in collaboration with 2 Balint Instructors from the International Balint Federation and the American Balint Society.

Results/CONCLUSIONS: The group has met monthly for 7 months and has worked out the majority of the technical issues which allow the group to function in such a virtual manner. This is the first Balint group of its kind and has shown that the virtual Balint setting is a possibility. The group hopes to share this journey of collaboration, learning, and deeper understanding so that others may take advantage of technology to perform their own similar groups. In addition to the great learning experience, this collaboration proves to better unite all WONCA regions and YDMs. Balint 2.0 Ambassadors are making a good example of a wider international view of breaking frontiers within the global world of Family Medicine, towards a new era for YDMs, young and future family doctors.

Asthma educational program (PAMA) in primary care. Randomised control trial (RCT). Results one year after implementation

Laia Lamarca Fornell, Xavier Flor Escriche, Silvia Álvarez Álvarez, Ainhoa Toscano Rivera, Belen Sanchez Rodriguez, Ingrid Pinilla Rodriguez, M Roser Sanchez Solias, Claustre Solé Brichs, Toni López Ruiz, Eva Fernández Alcantud, Sagrario Barcos San Andres, Silvia Penalva Guillamon, Natalia Peralta Garcia, Mónica Manzano Montero, Inmaculada Vega Manzano, Maria Úbeda Pastor, Sonia Labrador Martinez, Monica Rebollar Gil, Eulalia Villacampa Lavalle, Ana Domenech Borrás, M Mar Fraga Martínez, M Victòria Feijoo Rodriguez, Manuela Carmona Rabadan, M Pilar Martinez Martinez, C Eulalia Almendro Almendro
SAP Muntanya Barcelona Ciutat, Institut Català de la Salut, Barcelona, Spain

BACKGROUND AND AIM

Asthma prevalence has increased. International guidelines recommend follow-up visits to evaluate the impact of asthma and PAMA pretends to facilitate that.

We designed an intervention to improve disease control level and patient's quality of life, and the reduction of exacerbations and emergency visits.

METHODS

3 years long RCT, performed in 10 primary care teams, to evaluate PAMA which includes: patient education, asthma control test(ACT), explanation of inhalation systems, exacerbation symptoms and treatment action plan and revision of patient's technique.

RESULTS

Baseline

498 asthmatic patients included and randomized into 4 groups: I: PAMA application every 6 months: 124; II: every 12m: 120; III: every 18m: 115 and control group: usual management: 139.

Average ACT scoring was 20.9(SD 4.2) and global mini-AQLQ 5.7(SD 1.1).

47% patients didn't perform any follow-up visit in previous year. 663 follow-up visits were performed the year before costing 33119€. 485 visits due to exacerbations were performed costing 28851€.

First year

392 patients remain in the study: 84 (I); 98 (II), 100 (III) and 110 (control).

36% had intermittent asthma, 22.2% mild persistent and 35.7% moderate persistent versus 36.9%, 17.3% and 40% respectively at the beginning of study.

73.2% had controlled asthma versus 70.1% at the beginning of study. This difference is statistical significant in group III.

Average ACT scoring was 21.8(SD 4.1), and global mini-AQLQ 5.98(SD 1.05). Global difference for mini-AQLQ was statistical significant.

43.9% presented exacerbations versus 51.4% at the beginning of study. 890 follow-up visits were performed costing 40712€. 241 visits due to exacerbations were performed, valued in 19211€.

CONCLUSIONS

Patients maintain a good control and quality of life after a year. The percentage of patients with moderate persistent asthma was reduced.

The number of total exacerbations and the percentage of patients suffering exacerbations were reduced, with an associated costs reduction, too.

Keywords: Asthma, education, costs

OP-145

What medical students know about LGBT people and their health needs?

Ülkü Bulut¹, Dilek Güldal², Selin Bozdağ³, Demet Çelikkaya⁴

¹Balçova Community Health Center, Izmir, Turkey

²Dokuz Eylül University Faculty of Medicine, Family Medicine Department, Izmir, Turkey

³Kocaeli State Hospital, Kocaeli, Turkey

⁴Tepecik Education and Research Hospital, Izmir, Turkey

LGBT (or GLBT) are words' head letters, 'lesbian', 'gay', 'bisexual' and 'transgender'. There are no data to create a level about health of LGBT individuals because of less asking about sexuality during data collection. Homophobia among health professionals in working with LGBT patients, heterosexual assumptions, lack of knowledge, misunderstanding, such as excessive focus has been shown to cause barriers between patients and institutional personnel. In study we aimed to determine information about LGBT individuals and health needs, attitudes and behaviors of medical faculty sixth grade students.

METHOD: This research is a cross-sectional descriptive study. A questionnaire conducted to 134 Dokuz Eylül University Medical Faculty sixth grade students. Data collected with on-line survey and self fill out of questionnaire. Descriptive statistical analysis applied as well as the chi-square and t tests. SPSS 15.0 version used for statistical analysis.

RESULTS: In our study 49.3% of students were male. Mean age of students was 24.07 years. About their sexual orientation 3 student answered as gay, lesbian, asexual respectively. One student told that she did not decide yet. Two of them had LGBT person in their family, but 37.3% had LGBT friends. 39.6% of students told they had any source of information other than faculty. Most common sources were internet, committees and foundations. About taking detailed history 35.8%, about detailed physical examination 41.7% has not felt confident. 47.1% of students could not feel confident about taking care of LGBT patients in primary care. 65.7% of interns told they did not feel confident about taking care of LGBT patients.

CONCLUSION: Medical faculty education period should involve more detailed information about LGBT people for making students more confident about taking health care of their LGBT patients in primary care.

Keywords: LGBT, medical education, health care

OP-146

How to help to reduce the sitting time from Primary Care? The opinion of sedentary patients who are overweight

Elena Martínez Ramos¹, Carme Martín Borràs², Jose Manuel Trujillo Gómez³, Mercè Solà Gonfaus⁴, Eva Castillo Ramos⁵, Carlos Martín Cantera⁶, Dolors Rodríguez², Elisa Puigdomènech⁶, Angela María Beltran²

¹Primary Healthcare Centre, Vilanova, Institut Català de la Salut (ICS), Barcelona, Spain;

²Department of Physical Activity and Sport Sciences, FPCEE Blanquerna, Universitat Ramon Llull, Barcelona, Spain

³Primary Healthcare Centre, Cuevas del Almanzora, North Almeria Region, Spain;

⁴Primary Healthcare Centre, Les Planes, ICS, Barcelona, Spain

⁵Primary Healthcare Centre, Molí Nou, ICS, Barcelona, Spain

⁶Department of Medicine, Universitat Autònoma de Barcelona, Bellaterra (Cerdanyola del Vallès), Barcelona, Spain

Background and AIMS: The prolonged sitting time is a health problem that is increasingly more often in primary care consultations, especially in patients with overweight and obesity. Our main aim is to explore the opinion of these patients in relation with the expectations of help from Primary Care.

METHODS: Qualitative descriptive study conducted at three Primary Health Care centers from Barcelona. 23 patients with overweight or moderate obesity, aged 25 to 65 years, who reported sitting time for at least 6 hours a day participated in the study. Data was collected from 10 interviews (5 focal groups and 5 individual interviews) conducted by an expert moderator and an observer. Previously, informed consent was requested. All interviews were taped, transcribed and analyzed using. An analysis of thematic content was made using ATLAS. Ti programme and with triangulation analysis included.

RESULTS: A) Patients are unaware of the long-term risks of this behaviour for their health. Patients trust in Primary Health care professionals and believe that they are trained, for their knowledge and experience in detecting sedentary patients and educate them to reduce this behaviour. B) They believe that is more effective group education than individual advice in medical consultations. Patients prefer interventions through homogeneous groups (age and type of work). C) Patients considered important to monitor this behaviour from consultations and through e-mails, based on reminders, alternatives and questionnaires for comparing changes.ç

CONCLUSIONS: A sedentary lifestyle is an increasingly prevalent behavior. From Primary Health Care we can help to detect, educate and follow sedentary patients. Patient insights Were used to design an intervention to reduce sitting time within the frame of the SEDESTACTIV clinical trial.

The study is partially funded by Instituto de Salud Carlos III (PI11/01082).

OP-147

Awareness of HPV-associated Oropharyngeal Cancers Amongst Scottish GP Trainees

Cemal Kavasogullari¹, Isabella Roiatti², Claire Vassie⁴, Richard Gilson³, Matthias Lechner⁴

¹NHS Education Scotland

²NHS Lanarkshire

³Research Department of Infection & Population Health, University College London, UK

⁴UCL Cancer Institute, University College London, UK

OBJECTIVES: HPV related oropharyngeal cancers (HPVROC) are increasing in the developed countries albeit the decreasing rates of smoking related oropharyngeal cancers. Furthermore, there is increasing evidence of the role of HPV in anal, and penile cancers. In view of this relatively recent developments we aim to examine and compare knowledge of risk factors and epidemiological trends of HPV-associated head and neck cancer amongst GP trainees in Scotland.

METHODS: An 11 point questionnaire was administered to GP trainees in Scottish training programmes via an electronic questionnaire. Self-rated level of knowledge of this topic was assessed using the Likert scale. Questions on risk factors, presentation, epidemiological trends and the association with HPV were included.

RESULTS: 60 questionnaires have been completed to date of which 38.3% were GPST1, 25% GPST2 and 26.7% GPST2 stage trainees. 60% of participants recognised HPV as a risk factor for OPC and 78% stated that they were aware of the increase in rates of HPV-associated OPC. 51% of respondents rated their knowledge as “average” with 32% as “poor or very poor” and only 18% as “good or very good”.

CONCLUSIONS: Preliminary analysis suggests a high level of awareness of the role of HPV in head and neck cancers among the Scottish GP Trainees. The characteristics of HPV associated OPC were less well recognised. Data is currently subject to validation in a larger cohort. Findings may suggest that further training may be necessary for GP trainees in Scotland and similar research to be carried out in other developed countries to assess levels of awareness on HPV associated OPC.

OP-148

Bridging the cultural divide: Developing a structured academic CPD programme for Family Doctors, with a professional competence assessment

George Samoutis, John Howard

Department of Family Medicine, University of Nicosia, Cyprus

Background

A structured MSc FM academic programme of continuing professional development (CPD) designed and delivered for primary care physicians (PCPs) from a wide variety of background in Cyprus and the Eastern Mediterranean region, to orientate them to Family Medicine (FM). Uniquely, the clinically-focused first year Diploma level, provides a professional competence assessment, for which MRCGP(International) accreditation is intended. Many PCPs have no such opportunity for their CPD, nor to demonstrate their quality through an internationally recognised assessment of competence. Cyprus will introduce a primary care driven National Health System, which requires competent Family Doctors (FDs) for first contact and continuity of care with patients. WHO and WONCA have consistently proposed such a model. Many of the primary care workforce, in Cyprus and the Eastern Mediterranean, come from a variety of clinical backgrounds, without a formal orientation to FM.

METHOD:

The MSc FM is a modular academic CPD programme for such practicing PCPs. It is designed to be delivered in a user-friendly blended model of face-to-face and distance learning. University academic programmes traditionally

use assessment methods testing lower levels of Miller's pyramid. Professional competence assessments of FDs require methods testing higher levels. The assessment strategy ensures progression to research and teaching modules at Masters level, but the using modern assessment methods participants can demonstrate their quality against internationally recognised standards.

RESULTS:

The programme seems to successfully marry traditional university programmes with modern international professional competence assessment of FDs. It is currently being externally assessed academically by St George's Medical School, University of London, and for rigour of the competence assessment by the Royal College of General Practitioners.

Conclusions

The programme enables PCPs in the Eastern Mediterranean to undertake structured FM CPD, a FM competence assessment, and develop research and teaching skills to assist their contribution to the development of the discipline.

Keywords: Education CPD Competence

Innovative Training for Undergraduate Students in Family Medicine, Faculty of Medicine, University of Gezira, Sudan 35 years Experience

Salwa Elsanousi Hussein Elnaeim, Emad Eldin Eljak Suleiman, Magda Elhadi Ahmed Yousif, Mohamed Elmoktar Saad Eldin

Department of Family and Community Medicine University of Gezira Faculty of Medicine Wad Medani Sudan

Background

Faculty of Medicine University of Gezira (FMUG) since its establishment in 1975 is adopting community based education, integration of basic, clinical and socio behavioral sciences, and problem solving approach. Primary Health Care Centre Practice and Family Medicine programme. (PHCCP and FM) is one of the courses aimed to enable the students to play an active role in the delivery of Primary Health Care (PHC) at the level of the family and linking of the families area to the nearby health centres. The programme implemented in collaboration with PHC Team in four semesters. Each student is assigned a family to visit every other week, with the objective of recognizing the health problems at the family level and to acquire the skills of responding to major health problems and solve them through a holistic approach. In addition, students work in small groups in primary health care units, and participate in health service delivery.

WHO has recently recommended establishment of family medicine departments in all medical schools, in order to expose and sensitize students to this field.

Objectives

To bring our thoughts and experiences in undergraduate training on Family Medicine at FMUG, share with others and to further develop our training.

METHODS:

1. Curriculum analysis of PHCCP and FM course
2. Presentation of results of evaluation researches that bring evidence based SWOT analysis of the programme and its effect on the students, families and the PHC providers.

Results

Most competencies conform with those required for the future FM Medicine doctors. The students attitudes towards Family Medicine was positive. SWOT analysis proved: implementation of this course is acceptable, and relationships between the partners do matter.

Recommendation: Continue training of the health care providers to train the students and involvement of the Family Medicine doctors in training of the students, and further researches.

Keywords: Undergraduate training, Family Medicine, Gezira, Sudan

¹Department of Medicine, Pontifícia Universidade Católica de Goiás (PUC-GO), Goiânia, Brazil

²Department of Medicine, Universidade Federal de Goiás (UFG), Goiânia, Brazil

The medical school of Catholic University of Goiás (PUC-GO) is based on a methodology of problem-based learning, which aims to train doctors capable of an integrated, ethical and humane vision of the health-disease process. Therefore, the curriculum is developed based on theoretical and practical integrated axle and personal development axis. The project aims at training the student through direct contact with reality and with the current health policies, with the Unified Health System (SUS). In this regard, seeking an early integration with social reality and health services, the first period students are directed to carry out activities in the Northwest region of Goiânia, so they can get in touch with the needs of Northwest District health units and its strategic points. Activities were carried out in the School of Family Health Unit (UESF) in Vila Mutirão, in the Maternity Nascido Cidadão, in the House Seniors' residences in Vila Mutirão, at the Municipal Center for Early Childhood Education (CEMEI). Also in a state school in the region seeking effectuation of topics that were predefined by the professor Sandra Prudente and divided into the following areas: Thematic Area I, composed of the axes of acceptance and responsibility, bond, user autonomy, resolution, and permeability of social control and thematic Area II, composed of the clinical expansion axes, practical wisdom - scientific and popular knowledge, and local health education practices. To participate of these experiments was an enriching opportunity, as it created a bond between the population, staff and students. It also contributed to the process of health promotion and prevention, and to the learning process about the current health system, which changed the academics attitude.

Portfolio in postgraduate family medicine: experience from Saudi Arabia

Abdulelah Mutlaq Alqurashi, Saad Abdulrahman Alghamdi, Faisal Frahat, Almoutaz Alkhier Ahmed
National Guard Health Affairs

INTRODUCTION:

The health care system of Saudi Arabia has witnessed major changes since the early 1980s followed governmental commitment to the Alma Ata (USSR) declaration in 1978. One of the changes was the initiation of postgraduate training programs in family medicine. The Scientific Council of Family Medicine formed a committee to review and improve the program.

Objective of the study:

This study aims to assess residents' and supervisors' perceptions, experience and preferences about the use of portfolio in family medicine residency training program.

METHODOLOGY:

A cross-sectional survey conducted in family medicine residency training programs in the western region of Saudi Arabia including residents and supervisors using a validated self-administered questionnaire. All residents and supervisors at training programs will be invited. Total estimated number is 170 residents and 30 supervisors. The questionnaire includes information on participants' characteristics and questions to assess understanding the purpose and reasons for completing the portfolio. Questions are scored on a five point Likert scale. The questionnaires will be self-administered in the presence of the researchers for any inquires related to the questionnaire.

RESULTS:

One hundred and forty questionnaires were filled (70%). in supervisors group 66.6% filled the questionnaires and in the residents' group 70.06% filled questionnaires. The average score for resident's view of the portfolio was 3 while it was 3.6 in supervisors' group ($P < 0.05$). In the resident group the average score for ownership and motivation to use portfolio was 3.5 while it was 3.8 in supervisors' group (P). Average score for agreement on sections that should contribute to assessment of portfolio was 2.8 while it was 4.5 in the supervisors' group (P value < 0.0001).

CONCLUSION:

There is a need for cautious assessment of the family medicine training program. Improvement should consider residents point of views.

Expectations of General Practitioner trainees from courses designed in congresses A family medicine national survey from Turkey

Canan Tuz¹, Demet Merder Coşkun², Fethi Sada Zekey³, Fikret Merter Alanyalı⁴, Berk Geroğlu⁴

¹department of family medicine, baskent university, ankara,turkey

²department of family medicine, marmara university, istanbul, turkey

³department of family medicine, ümraniye eğitim araştırma hastanesi, İstanbul, Turkey

⁴department of family medicine,tepecik eğitim araştırma hastanesi, izmir,turkey

Courses play an important role in training process of General Practitioner (GP) trainees. The aim of this study is to identify the needs of GP trainees on subjects and learning methods of courses designed in congresses.

This is a cross-sectional study which was held in 2014 during a national congress named “Family Medicine Research Days” which was organised twice a year. Fifty two volunteer GP trainees were involved in the study. They performed a 10-item-questionnaire including demographics and questions about which subjects and learning methods would they prefer in courses designed in congresses.

Demographic data reveals that %69.2 were female and %30.8 were male. The average age was 28.6 SD 3.21. The average duration of training in family medicine was 1.79 years.

Ninety eight point one percent of participants wanted to attend a course during a congress, 90.4% had already attended a course and 44.2% found it useful. The most preferred subjects were practical administrations about office management and internal medicine with the rates of %80.8 and %61.5 respectively. Only %11.5 of participants were eager to know more about small surgeal techniques. Seventy five percent of them wanted to have a practical assesment and %57.7 of them wanted to join a session performed by an expert on the subject. Fifty three point eight percent of them chose video or film presentation in learning while only 12 residents chose of peer group learning. %44.2 of them wished to become an expert in some sub-specialties like obesity threathment and social pediatrics.

According to this study, GP trainees need to have courses about practical administrations about office management and internal medicine which should be performed by an expert by the help of video presentations.

OP-153

GPs facing medical liability: from knowledge to current practice

Humbert De Freminville

Department of family physician, University of Lyon, France

Background & Aim. GPs in France are concerned by the medical liability, and worries about it. Law 2002-303 formalizes the medical liability and patients' rights. Law No. 2004-810 defines GP and scope. The main objective is to assess the knowledge and sources of information of GPs related to these laws. Secondary objectives are whether these laws have changed GPs practice on the information and the doctor-patient relationship.

Method. A descriptive quantitative survey was conducted in France in the Rhone Alpes main aerea. An email explaining the purpose of the study was sent to 2,362 GPs via the mailing list of URPS professional database. 299 physicians participated anonymously. Chi2 test, and Chi2 Cochran-Armitage Test were used.

Results. 47% of GPs know the law 2002-303, without link between knowledge and involvement of medical liability. There is no link between the knowledge of the law 2004-810 and proceeding. Professional insurances are the main source of information for GPs. 64% of GPs have not changed the way they manage the medical file. 69% say that these laws have not changed the doctor-patient relationship. GPs indicate more changing in medical record related to information to the patient and doctor-patient relationship when knowing these laws.

Conclusion. GPs have a poor knowledge of the laws governing their practice. Their main source of information is their business insurance. Knowledge of the laws with the analysis of medical malpractice complaints helps to know the main causes of disputes and prevent them.

Keywords: GPs, liability, law

⁵American Academy of Family Physicians

We have made an exchange in USA with the FM360^o program (VdGM) in 2015. We would like to tell European Family Medicine Doctors our experience in Chicago and in Plainville (Kansas), because it is one of the most interesting things we have ever done during our residency as a Family Doctor. The opportunity to stay in two different areas, the rural one in Kansas and the urban one Chicago, has given us a general view of the country and we have learnt a lot about the American medicine and the american culture. In the village everything goes slowly and the medical resources are less than in the urban areas. As well, the number and the kind of patients is different. In Kansas people are older than in Chicago, and Doctors there, know the patients, their families, their problems, the kind of life, this give rural doctors a lot of information of the patients and the relationship between patient and doctor in more fluid and close than in the city. With this experience we have learnt a lot about The American Health system as well. It is very different if we compare generally with our European health systems. The big part of the American system is private and managed by Insurance Companies, but nowadays things are changing, and we have had de opportunity to see this. Now, exists "Obama Care". This new system allows that people without money can access to the health system, sometimes with restrictions but they can have medical basic assistance. We recommended to others residents and physicians this experience, because gives you the opportunity to learn about other health system, compare it with yours, and teaches you to understand the best things of our health systems and to learn the things that can be changed or modify.

BenZoPrev: Prevalence of benzodiazepine prescription in Family Health Unit Famílias

Ana Margarida Pinho, Tânia Martins Dias, Adriana Rosas Relvas, Ana Palhares Delgado, Ana Sofia Azenha, Célia Gomes Silva, Jacinta Oliveira Vaz, José Nunes Sousa, José Pedro Águeda, Maria Miguel Sá, Nádia Fernandes Correia, Sara Generosa Almeida

ACES Entre Douro e Vouga I Feira/Arouca, USF Famílias, Lourosa, Santa Maria da Feira, Portugal

Background & Aim

Benzodiazepines are a class of psychoactive drugs used to treat anxiety, insomnia and other problems. Chronic benzodiazepine treatment can cause tolerance, physical and psychological dependence.

The prevalence of benzodiazepine consumption in population-based studies range from 2 to 10% in the adult population. 15 to 30% of the consumers are chronic users.

Therefore, is essential to understand the prescription habits and to aware the physicians for the rational use of benzodiazepines.

With this study we aim to determine the prevalence and the type of benzodiazepine prescription and to analyze the influence of sociodemographic characteristics, alcohol and tobacco consumption, psychiatric and neurological disorders in the users.

Method

A cross-sectional analytic study was performed. A random sample (n=1360) of patients aged 18 or older from the Family Health Unit Famílias was studied.

The relation between Benzodiazepine prescription and age, gender, profession, educational degree, alcohol and tobacco consumptions, number of encounters from 2011 to 2013 and psychiatric and neurological disorders was studied. Type and duration of Benzodiazepine prescription were assessed.

Results

Prevalence of Benzodiazepine prescription between 2011 and 2013 was 22,9%. The chronic use of this drug was 46,3%. Alprazolam was the most prescribed benzodiazepine. A quarter of users were consuming more than one benzodiazepine at the same time.

There was a positive correlation with female gender, old age, low education, unemployment or retirement, psychiatric and neurological disorders and greater number of encounters.

Consumption of alcohol and tobacco had a negative correlation.

Conclusions

The prevalence of benzodiazepine consumption was higher to that found in other studies.

Despite this, the prevalence of chronic use of benzodiazepine is in accordance with published results. The consumption was more frequent in women and increases with age.

The benzodiazepine consumption didn't have association with alcohol and tobacco consumption, so there wasn't an overlapping of dependencies.

Keywords: Benzodiazepine, Prevalence, Primary Health Care

Hemodialysis Units and the characteristics that influence the access to them

Christinne Maymone Gonçalves¹, Robson Yutaka Fukuda², Ana Rita Barbieri³

¹Faculty of Health Sciences, Medicine, Federal University of Grande Dourados

²Health Secretary of Mato Grosso do Sul State, Brasil

³Faculty of Medicine, Federal University of Mato Grosso do Sul

o Background & Aim

Knowing the factors that influence the access to health services contributes to the planning of public policies better. The Chronic Kidney Disease - CKD requires effective measures for health equity. In Brazil, the number of patients in dialysis in 2011 was 91,314, and about 85% of treatments were paid by the Unified Health System - SUS. This study described the profile of patients in the Midwest state of Brazil related to the rates of Sensitive to Primary Care Hospitalizations (ICSAP) and coverage of the Family Health Strategy (FHS).

o Method

Descriptive Study conducted in 2011 that analyzed 4,475 High Complexity Procedures (APAC) for the 1,340 patients residents in 78 Municipalities of Mato Grosso do Sul, that did hemodialysis in any of 13 clinics distributed in 7 Municipalities of MS. We used BioEstat 5.0[®] and Spearman's coefficient, for the analysis.

o Results

More men did hemodialysis, 0.67 ratio, with a predominance of young adults with a mean age of 53 years, followed by 23.27% of elderly, white race were 44.69%. There were not significant correlations between people on hemodialysis with the ESF coverage neither than ICSAP' rates. There was a positive correlation between the ESF coverage and ICASP rate ($\rho = 0.2713$, $p = 0.0287$), i.e. the greater the coverage of the ESF more ICSAP' rate high.

o Conclusions

It was identified less proportion of seniors making hemodialysis than other countries. There was no correlation between hemodialysis and the coverage ESF and ICSAP rate. But it was found a correlation between increased coverage ESF with higher rates of ICSAP, ie, municipalities are not reversing ICSAP rates, an important indicator of the quality of the ESF, which raises the need to expand research in this area.

⁴University of Bergen, Bergen, Norway

⁵Catholic University of Sacred Heart, Rome, Italy

⁶Charles University Prague, Prague, The Czech Republic

⁷University of Warsaw, Warsaw, Poland

⁸Economic Policy Research Foundation of Turkey, Ankara, Turkey

Background & Aim

European countries are extending the roles of nurses and introducing allied professionals to improve health care services. The MUNROS project will assess the outcomes of these changes in primary care and hospital care. The aim of this study, one of ten stages of MUNROS, was to explore new professional roles.

Methods

Two case studies in each of eight countries were undertaken in primary clinics and hospitals for three conditions: diabetes, breast cancer, acute myocardial heart infarction. Countries included: Czech Republic, Germany, Italy, Netherlands, Norway, Poland, Scotland and Turkey. The case studies included 160 semi-structured interviews with professionals and managers, and 600 hours of observation to explore how new roles are formed and allocated.

Results

Across the eight countries new roles for nurses and allied professionals developed in two directions. The first direction is specialization. The key examples are specialist nurses and specialist technicians. Delegated work is diverse and extensive. It includes screening, triage, diagnostic examination, the design of therapy and even high-risk therapies. The second direction is innovation of services. Key examples are a practice nurse, an out-patient-clinician or an advanced nurse practitioner. They provide new services to patients, such as a clinic for adverse drug effects or daily outreach support to patients.

We identified four patterns: 1) the traditional skill mix with physicians and nurses; 2) a highly specialized skill mix with specialized physicians, specialized nurses and specialized technicians, 3) an innovative skill mix with advanced roles for allied professions, and 4) specialized innovative skill mix that combines the specialized skill mix and the innovative skill mix.

Conclusions

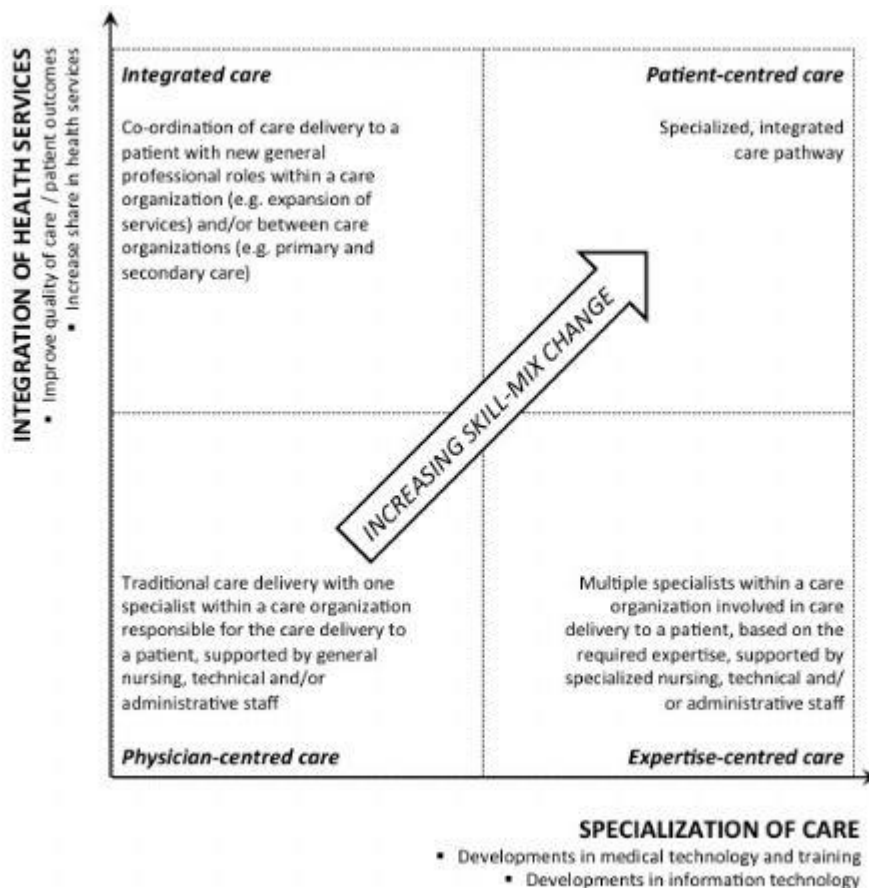

Changes in professional roles occur in all countries, but there is variation in the exact patterns observed.

Discussion

New professional roles increases competition between primary care clinics and hospitals over who coordinates care and who provides general care.

Keywords: integrated care, new professional roles, comparative study, Europe, skill mix

Patterns in skill mix

Do structural aspects of health services contribute to reducing mortality rate by hypertension?

Ana Rita Barbieri¹, Crhistine Maymonne Gonçalves², Maria De Fátima Meinberg Cheade¹, Cleuzieli Moraes Santos³, Daniel Henrique Tsuha³, Cristina Souza¹, Kássio Costa Ferreira¹

¹Universidade Federal de Mato Grosso do Sul

²Universidade Federal da Grande Dourados

³Secretaria de Saúde de Mato Grosso do Sul

Background & AIM: The impact of chronic diseases on the countries' health services poses an important health issue. The surveillance, prevention and treatment of high blood pressure (hypertension), a disease with severe morbidity and mortality, can be performed in primary care, especially in the Family Health Units (USF), with good results. This study discusses the variables of coverage and structure of USF associated with rates of mortality caused by hypertension.

METHOD: Searches have been done in the Mortality Information System (SIM) and systems of primary care (SIAB) of 78 municipalities in the state of Mato Grosso do Sul, Brazil, with about 2.6 million inhabitants. The prevalence of the disease was calculated for three age groups: over 18 years, between 60 and 69 and above 75 years. The Pearson correlation allowed the analysis of the association of variables. The study was funded by FUNDECT and authorized by the Ethics Committee.

RESULTS: Municipalities with a larger number of patients treated by health teams, whether or not in the primary care units, presented higher death rate ($p < 0.025$). However, in a specific region with 17 municipalities and 1,056,932 inhabitants, association was seen between reduced mortality and USF coverage ($p < 0.001$). A negative correlation was also found between the rate of mortality caused by the circulatory system and the amount of physicians and other professionals, that is, the greater the number of these professionals, the lower rates of mortality by the circulatory system ($p < 0.046$).

CONCLUSIONS: Preliminary results of this study highlight the importance of a comprehensive coverage of Family Health Strategy as a policy to ensure the equity of the population's access to health services so as to reduce mortality by chronic diseases such as hypertension. Ongoing analyzes will examine the relationship between the distribution of services and morbidity/mortality.

Organisational reforms in Portuguese health care 2005-2015 – what impact on primary care?

André Biscaia¹, António Pereira², Sílvia Machaqueiro³, Luís Velez Lapão⁴, Paulo Nogueira⁵, Ana Rita Antunes³

¹Unidade de Saúde Familiar Marginal, ACES Cascais

²Unidade de Saúde Familiar Prelada, ACES Porto Ocidental

³Associação para a Cooperação e Desenvolvimento Garcia de Orta (AGO)

⁴Instituto de Higiene e Medicina Tropical – Universidade Nova de Lisboa

⁵Direcção-Geral da Saúde

Background and aim

Over the past years Portuguese primary health care (PHC) went through a number of important evolutions, including the design and implementation of new organisational structures, the reorganisation of PHC services and the decentralisation of decision-making.

One major health care reorganisation introduced Family Health Units (USF) – small multi-professional and self-organized teams of public administration employees with broad technical and organizational autonomy to take care of a defined population – and ACES (health centre groups) as the cornerstone of the 2005 PHC reform. The Local Health Unit (ULS) model was revived, aiming at integration of care through joint management of primary and secondary care in a specific area.

This reform movement brought a recently-emerging municipalisation trend, which introduces an organisational

and administrative decentralisation to municipalities.

Method

A literature search and review were performed using terms like “primary health care”, “family health units”, “reform”, “local health units”, “municipalities”. Resulting selected papers, legislative documents and reports since 2005 were reviewed.

Results

Overall, USFs have improved coverage and access to PHC, covering about 47% of the population at the end of 2014. The USF model was considered efficient. There are currently 418 active USFs and an average of 95 new applications are submitted each year.

Conversely, ULSs haven't had the intended impact on access, quality, continuity of care and financial efficiency as measured by indicators like waiting times, ratio nurses/doctors and number of avoidable hospitalisations. ULS are still dominated by the hospital partner inertia.

Conclusions

Although ULSs are seen as a “failed experiment”, USFs are widely regarded as a success concerning efficiency, access and proximity of care.

Having only officially been legally outlined in 2015, it remains to be assessed whether municipalisation of administrative competencies in Health will have a positive impact on local healthcare management, particularly PHC.

OP-160

The Role of a Short Stay Unit in the Municipal Polyclinic of Mytishi, Moscow Region of Russia

Boris Valentinovich Agafonov¹, Lubov Kikot¹, Natalia Shevtsova¹, Lesca Cherise Hadley²

¹Moscow Region Clinical Studies Institute, Moscow, Russia

²John Peter Smith Hospital, Ft. Worth, Texas, United States of America

BACKGROUND: Twelve years ago, in accordance with the Russian Federation health improvement programs, the Short Stay Unit of the City Polyclinic at Mytishi was developed to provide effective and efficient care of the patients in the local area. This oral presentation will demonstrate the medical, economic, and social benefits of a Short Stay Unit when it is integrated into a primary care clinic.

METHOD: An overview of the Short Stay Unit will be described which will include the number of available beds, instruments and medical personnel. Common procedures as well as the most prevalent indications for stay will be presented.

RESULTS: The Short Stay Unit has resulted in a 40% decrease in general practitioners' hospital referrals. 96.5% of the patients were discharged with “improvements in health” or a “restoration to health.” 92% of patients were discharged “able to work.” 3.5% of the patients were discharged with no change in their condition. 8% continued their treatment at home under a general practitioner's supervision. No patients from the Short Stay Units have required a transfer to the hospital for the last 3 years. The Short Stay Unit costs 2.2 times less per day than the hospital with the same medical outcomes. Beds may be used by three patients through the day decreasing costs. The Social Insurance Fund which provides money for those who have short term disability saves money by having the patients return to work more quickly. Medications and services are free for the Short Stay Units in accordance with the Russian Federation state programs thus improving patient's satisfaction. Successes and challenges in implementing the short stay unit will be discussed.

CONCLUSION: Short Stay Units in Multispeciality Clinics may provide cost-effective care in a coordinated setting with high patient satisfaction.

Managing Urinary Incontinence: The Difference Between Clinical Setting

Maliza Mawardi¹, Noorzurani Robson²

¹Department of Family Medicine, Faculty of Medicine and Health Sciences, Universiti Putra Malaysia, Selangor, Malaysia.

²Department of Primary Care, Faculty of Medicine, Universiti Malaya, Kuala Lumpur.

Background & AIM:

Women are known to develop urinary incontinence due to various reasons as compared to men. More than half of women in Malaysia with urinary symptoms have urinary incontinence. Affected women would seek medical attention especially from primary care physician in relation to their problem. Studies have shown that urinary incontinence could be managed successfully at the primary care level. This study was to determine and to compare the management of primary care physicians in the management of female urinary incontinence in different settings of their practice.

METHODOLOGY:

A multi-centered cross-sectional study was performed among all primary care physicians practicing in the government health clinics in Selangor, Malaysia and a hospital based primary care clinic in Kuala Lumpur Selangor using a self-administered questionnaire. Samples were collected conveniently in September 2012. Analysis was performed using SPSS version 21. Descriptive analysis and analysis of association were performed using chi square test. This study is a sub-analysis from a study on "The attitudes and practices of primary care physicians in the management of female urinary incontinence".

RESULTS:

Most primary care physicians were determined that female urinary incontinence could be managed at the primary care level. However, primary care physicians from the hospital based primary care clinic had demonstrated significant associations in majority aspects of management female urinary incontinence. This includes both investigation and treatment.

CONCLUSION:

More studies need to look into the aspect of reasons why physicians in the government health center had significant difference in managing female urinary incontinence at the primary care level.

Keywords: urinary incontinence, primary care physicians

OP-162

Health Policy of the Primary Health Care: an overview of family medicine in Macedonia

Kiril Soleski

Association of GP/FM of Macedonia

Introduction

Health systems centred on Primary Care represent a global objective and a clear way of evolution. A strong Primary Health Care (PHC) system results in a healthier population and may affect population health more than specialized services. Family medicine in Macedonia began to implement in 2009 starting specialist studies in family medicine. This process was supported by international grants. After this support has ended, it is important to keep up with the development and priorities.

Aims and methods

The aim of this paper is to analyze the current legislation and strategies for family medicine and to give proposals for its future development. Information about the situation was gathered from literature reviews and personal interviews.

Results

Data demonstrate that family medicine has been formally recognized and introduced in university curricula. The key areas of concern are lack of interest for specialization, atomization of practices, unsatisfactory payment systems, lack of academic infrastructure and unsatisfactory continuous professional development. On the other hand the Department of Family Medicine was established, specialization of family medicine and additional education for general practitioners has begun. Family Medicine is a fundamental part of primary care and many studies conclude that it should be organized into group practices or health centers. There is a hidden threat of bureaucratization, where health centers lose their basic functions. According to the Health Strategy, all doctors working in the family medicine service are supposed to have undergone specialization by the year 2020. A multilayered financing model must be used: containing a capitation coefficient based on the severity of illness, fee for service payment, payment based on quality indicators and specific program paying.

Conclusion

The position of family medicine in Macedonia is formally adequate, but a lot of effort will still be necessary to achieve the desired level of its recognition, functionality and quality.

OP-163

Strategy to improve the implementation of ecography in primary care

Lourdes Martin, Alejandro Abon, Pilar Garcia, M Luz Peralta, Maite Sanz, Francisca Rodriguez, Javier Roldan
Dirección Asistencial Oeste, Gerencia de Atención Primaria, Madrid, Spain.

Background and aim

As a diagnostic tool ecography increases the clinical performance of family doctors. It improves clinical decisions and enhances the satisfaction and confidence in the doctor to patient relationship.

To increase and improve the use of ecography in primary care.

To provide adequate training in ecography to family doctors.

Methods

Cross-sectional study with a management intervention performed in 14 rural and urban primary care centers of the western part of the Community of Madrid with an estimated population of 320000 inhabitants, between July and October 2014.

Structure of the interventional strategy:

1. Identification of trained doctors and those performing ecography on a routine basis.
2. Individualized working meetings on primary care centers with available ecography.
3. Follow-up and individualized support of the training program to doctors voluntarily involved in the project.

Results

Among ecography trained doctors 61% of them use the test regularly (more than 5 ecographies per year). During the first 6 months of 2014, a total of 524 ecographies were performed. After the intervention this figure raises to 846 on the same period of time. The yearly evolution and number of centers performing ecography is 513 in 2012 in 7 centers (average 73.2 ecographies/center/year), 960 in 2013 in 11 centers (average 87.2 ecographies/center/year) and 1426 in 2014 in 14 centers (average 102 ecographies/center/year).

Conclusions

Primary care support strategies and management training in ecography increase the number of ecographies performed at primary care centers. Since training in ecography is multidisciplinary, internal training management in primary care centers is crucial to improve the learning curve of ecography among family doctors.

OP-164

Breast Cancer on the Internet: Quality of Information and Popularity of Turkish Websites

Ebru Yılmaz¹, Yusuf Üstü², Selçuk Yıldız¹, Sevim Öğülmüş¹, Mehmet Uğurlu²

¹Department of Family Medicine, Ankara Atatürk Training and Research Hospital, Ankara, Turkey

²Department of Family Medicine, Yıldırım Beyazıt University, Faculty of Medicine, Ankara, Turkey

Background and AIM: Use of the Internet is increasing and many patients are turning to the Internet to search for health related information. But the Internet has provided great opportunities for disseminating both accurate and inaccurate health information. Therefore we aimed to determine the characteristics of breast cancer related Turkish websites and whether more popular sites are of higher quality.

METHOD: The most popular search engines Google and Yandex were used to generate a list of websites about breast cancer. Top 100 sites per each search engine were recorded to analyze, which were returned in response to the query 'breast cancer'. Web sites were excluded from the analysis if they contained irregular information (eg, corporate advertisements, blogs), repetition or were inaccessible. Each selected websites was assessed using two qualified tools including Google PageRank for popularity and the LIDA tool for quality.

RESULTS: 67 sites were eligible for evaluation. 55,2% (n=37) of the sites were found to be individual. The author of the 36 sites (53,9%) was not clear. The mean of Google PageRank of the sites was 1,28. The mean of total score of LIDA tool was 54,6±14,7 and the mean of the reliability score was 17,5%±18,2. The LIDA values for reliability was poor. There was no significant correlation between the variables of LIDA tool and PageRank (p>0,05).

CONCLUSIONS: We tried to identify the current status of the websites by generally accepted particular quality tools. According to our study breast cancer related sites are unreliable. There is a need for the further studies that evaluating the effects of these information on the patients' health.

Keywords: Breast Cancer, Web sites, Quality

OP-165

Evaluation of efficiency and efficacy in the surveillance and monitoring of diabetes in primary health care - a Portuguese case study

Maria Castelo Gouveia, Maria Isabel Climaco

ISCAC, Quinta Agrícola - Bencanta 3040-316 Coimbra, Portugal

This study assesses the efficiency of Primary Health Care units monitored by a Group of Health Centers in a Portuguese region regarding the surveillance and control of diabetes under two perspectives: use of resources and clinical efficacy of services. The study uses the Value-Based Data Envelopment Analysis (DEA) method, combining a DEA additive model with Multi-Criteria Decision Analysis allowing the incorporation of management preferences.

Resources include the time devoted by doctors and nurses to the diabetic patients, the costs of medication, and complementary means of diagnosis and treatment prescribed. The outputs are the number of patients with consultation registers of weight and height, LDL cholesterol levels, blood pressure, requests for analysis of microalbuminuria levels, feet exams, oral antidiabetics and/or DPP-4 inhibitor prescribed (if necessary), antihypertension medication prescribed (if necessary).

The assessment of clinical efficacy has as inputs the outputs of the efficiency evaluation of services concerning diabetes surveillance and its expected clinical RESULTS: number of patients with BMI >18 kg/m² and <25 kg/m², LDL cholesterol levels ≤100 mg/dL (mmol/L), blood pressure <130/80 and HbA1c ≤ 8%.

The results of the efficiency models enable to identify the potential of reduction of the number of doctors or nurses taking care of diabetic patients in healthcare units and units that should assess diabetic patients more attentively to allow for more efficient medical care. Units having the best practices and services are identified, with impact on the clinical wellbeing of patients. However, there are efficient units with low efficacy and inefficient units with high efficacy.

This analysis helped decision makers to identify best practices, sources of inefficiency and gaps in relation to best practices, leading to unveil improvement opportunities.

Keywords: Diabetes, Data Envelopment Analysis, Primary Health Care, Efficiency

OP-166

Modelling Primary Care Reform Strategies

Joachim Sturmberg

Newcastle University - Australia

BACKGROUND: rising healthcare costs are perceived to be driven by the ageing of the population, increasing patient demands secondary to the medicalisation of everyday life, and new technologies and drug developments. Governments and funders alike favour financial incentives and disincentives as the tools to curtail the over use of medical services by patients and providers alike.

AIM: to assess the outcome of service utilisation changes on health service use and costs

METHOD: we built a model of the healthcare system based on Kerr White's "the ecology of medical care" framework. Based on consensus assumptions we modelled changes in people's health seeking and health service use individually and in combination to assess the impact on primary-care workload, secondary care workload and health professional provider costs, as well as their impact on the consumption of pathology and radiology services and prescribing.

RESULTS: the results of this modelling work will be presented at the meeting and its consequences for individual practitioners and the health system at large will be explored.

CONCLUSIONS: modelling health reform ideas prior to their implementation offers a way to engage all affected parties in the reform process. Greater transparency and participation in exploring the issues and their potential solutions will achieve more acceptable solutions to keeping healthcare systems financially sustainable.

OP-167

private or salaried practice: how do general practitioners make their choice? A qualitative research study in France

Shérazade Kinouani, Gary Boukhors, Baptiste Luaces, Bernard Plédran, Bernard Gay

Department of general practice, University of Bordeaux, Bordeaux, France

Background & AIM: in France, the primary health care system is largely based on the private practice of general practitioners. The number of general practitioners who had exclusively a private activity has decreased of 4.4% these last seven years, while the number of salaried general practitioners has increased. These trends could continue, at least until 2020, in spite of measures taken by French government or local communities to encourage young practitioners to choose private activity. The aim of this study was to explore the reasons determining choice between private or salaried practice among young general practitioners in Gironde (France).

METHOD: a qualitative study was conducted by semi-structured interviews with a purposive sampling of young general practitioners in Gironde between June 2013 and April 2014, until reaching saturation. Data were analyzed according to Grounded theory, after triple coding.

RESULTS: Through the 16 interviews led, multiple occupational factors were found, the first being professional interest. Their choice was not much influenced by the installation location (rural or urban). The occupational factors had to be consistent with their private (family or social) life. Young practitioners were attracted by health centers. They hoped a less intensive work rhythm, which would lead to a better quality of care, an easier access to team work or the possibility of advantages of the public area in general practice. They thought current incentives were not efficient enough, inaccurate and weakly known.

CONCLUSION: The problem of French medical demography could be resolved with incentives who take into account at a time the needs of population and the wishes of young doctors. A political effort must be made in order to give to the French universities enough resources to train and encourage the future general practitioners to the private practice. **Keywords:** general practice, private practice, qualitative research

OP-168

Implementation of the French patient safety program The first results of patient safety in primary care

Jean Brami, Bruno Bally, Laetitia May
Haute Autorité de Santé (HAS), France

Historically, the two seminal reports, "To err is human" and "An organization with a memory", were only concerned with adverse events occurring in hospitals, where the level of severity of harm is more important than in primary care, due to the greater use of invasive techniques. Arguably, however, the ambulatory environment is very different from the hospital environment. In particular, the number of encounters with patients is comparatively much higher. For example, in France there are one million consultations a day with GPs, making the likelihood of errors larger than in hospitals.

The French Government has launched a five-year program (2013-2017) in line with international recommendations, which includes the recommendation on patient safety adopted on 9 June 2009 by the European Union Council, which aims to promote the emergence and development of a safety culture that associates users and health professionals, and reduce preventable adverse events.

The Haute Autorité de Santé (HAS) - or French National Authority for Health - is one of the main intermediaries in the implementation of the actions defined in the program. These actions are structured around four axes: (1) patient information, the patient as co-actor in patient safety; (2) reporting of serious adverse events; (3) training, safety culture and support; and (4) innovation and research.

In order to evaluate the results of this program, a survey was conducted among GPs, nurses and pharmacists. The first results of this survey were presented at the 2011 WONCA conference in Warsaw. A second survey will be conducted at the end of 2017.

This seminar will present what is being done on patient safety in primary care in France at local and national levels to share with colleagues from other countries our experience and help building a European network on this very important topic.

Trends in social inequalities in health during the recession: the example of diabetes

Ludovic Casanova¹, Adriana Martin De Vidales¹, Sebastien Cortaredona², H el ene Carrier¹, Pierre Verger²

¹Aix Marseille University, Department of general practice, Marseille, France

²INSERM, UMR912 "Economics and Social Sciences Applied to Health & Analysis of Medical Information" (SESSTIM), 13006, Marseille, France

OBJECTIVE

Social inequalities in health exist in the management of chronic diseases such as diabetes in France, as elsewhere. The recession that began in 2008 has led to increased income disparity. Has it also sharpened health inequalities? The aim of this study was to describe trends in these inequalities during this period through the example of diabetes.

METHOD

This analytic study used data from refund databases of the regional national health insurance fund (Provence-Alpes-C ote d'Azur region) and from socio-demographic databases of the national statistics office (INSEE) for 4 full years (2008 to 2011). It included individuals who had been reimbursed for 3 purchases of oral diabetes drugs during the previous year and evaluated the association between the median household income of each patient's municipality of residence and 7 indicators of diabetes monitoring and care. Using adjusted mixed logistic models, including an interaction term between time (number of years) and the median household income of the municipality, we examined the performance of the indicators for each year (i.e., whether the patient received the

care recommended that year). When the interaction term was significant, data were stratified by year.

RESULTS

The total number of patients with diabetes in the 941 municipalities of the PACA region varied by year from 142 055 to 164 929. Models showed that living in a town with a high or intermediate household income was significantly associated with better performance of the 7 indicators and that the interaction term was significant for 6 of them. The stratified analysis revealed that the effect of the municipal median income decreased significantly between 2008 and 2011 for 5 indicators: HbA1c, LDL-cholesterol, microalbuminuria, ophthalmoscopy, and endocrinology visit.

CONCLUSION

Social inequalities in health persisted between 2008 and 2011 in monitoring diabetes patients but appeared to be decreasing, despite the recession.

Patient's Satisfaction in Primary Health Care, Bandung, Indonesia

Fedri Ruluwenta Rinawan, Nita Arisanti, Insi Farisa Desy Arya, Henni Djuhaeni, Guswan Wiwaha, Sharon Gondodiputro, Elsa Pudji Setiawati
Department of Public Health, Faculty of Medicine, Universitas Padjadjaran

Background

Patient satisfaction refers to the extent to which the patients perceived that their needs and expectations are met by the service provided. It means the best health outcomes that are possible given by the available resources should be consistent with patient values and preferences. Patient or client satisfaction is one indicator that can be used to determine whether the Health Care Provider will be a part of health insurance scheme. Universal health coverage in Indonesia was implemented in 2014 as well as in Bandung District.

This study assessed the level of satisfaction with quality of care received by patients attending a primary health care in Bandung District, Indonesia.

Method

This study was a cross-sectional study involving 486 patients in various type of primary health care in Bandung such as government primary health care (Puskesmas), private doctors, private midwives, and private dentistry. Adult patients were selected by cluster sampling. Respondent who met the inclusion criteria in each cluster was selected by consecutive sampling. Data were collected using 'Service quality' (servqual) questionnaire.

Satisfaction was measured by semantic differential scale from the following domains: tangibles, reliability, responsiveness, assurance and empathy.

Results

The result of this study showed that most of patient (72%) did not satisfy with the service provided in primary health care, specifically the patient did not satisfy with tangible (66.1%), reliability (57.5%), responsiveness (53.3%), assurance (47.5%) and empathy (59.3%). Dissatisfaction was expressed by most of patients attending government primary health care (Puskesmas).

For a country to achieve universal health coverage, several factors must be in place, including sufficient capacity of well trained, motivated health workers in providing the services to meet patients' needs. The government and private primary health care should make self-evaluation and improve the quality of health service.

OP-171

Effect of general practitioners' cooperative emergency care on hospital emergency department walk-in patients

Annemiek Bosch Van Nuenen¹, Dd De Jong¹, Frans Bongers², Johannes Mulder³

¹Isala Hospital, Zwolle, The Netherlands

²Hein Hogerzeil Stichting, Zwolle, The Netherlands

³Consultant Family Medicine. Zwolle, The Netherlands

BACKGROUND-AIM:

An increasing number General Practitioners' Cooperatives (GPCs) for primary emergency care are being encouraged to occupy a location next to the Emergency Department (ED) at hospitals with shared reception where walk-in patients are triaged to the most suitable form of emergency care. In this situation as a rule every walk-in patient is seen by the GPC triagist specialized nurse, unless clear acute ED treatment is required. Although this combined approach is presumed to be effective in financial and patient care terms, little research has been carried out into the effectiveness.

Method

This longitudinal, prospective study was performed at the Isala Hospital in Zwolle before and after co-location of GPC and ED in August 2013. Patient data were collected for all patients presenting at the GPC/ED during two four-month periods, before and after co-location starting December 2012 and December 2013. For walk-in patients the study registered the location of treatment, treatment times, diagnosis and costs.

RESULTS:

Walk-in patients at the ED before/after co-location: 757/303. Walk-in patients at the GPC before/after co-location: 324/855. Average Cost per patient at the ED before/after co-location: €1106/€1492. Average Cost per patient at the GPC before/after co-location: €108/€107. Median Treatment duration at the ED before/after co-location: 81/116 minutes. Median Treatment duration at the GPC before/after co-location: 27/31 minutes. In the period after co-location one patient had to be relocated from GPC to ED by the family doctor responsible for treatment. At the ED, during this second period a significant increase in cardiac problems and decrease in locomotor problems was identified. Extrapolating this to a year would suggest savings of one million euros a year.

CONCLUSIONS:

A significant drop in walk-in patients and costs was seen at the ED after co-location of GPC/ED and triage by GPC, with diversion of low complexity care to the GPC.

OP-172

Walk-in patient burden at Emergency Departments in the Netherlands in 2012

Annemiek Bosch Van Nuenen¹, Dd De Jong¹, Frans Bongers², Johannes Mulder³

¹Isala Hospital, Zwolle, The Netherlands

²Hein Hogerzeil Stichting, Zwolle, The Netherlands

³Consultant Family Medicine. Zwolle, The Netherlands

BACKGROUND-AIM:

Walk-in patients can be cost-ineffective if low complexity medical problems are treated at the relatively expensive ED instead of through General Practitioners' Cooperatives (GPCs) emergency care, which is well organized in the Netherlands.

An increasing number of GPCs are being located next to the Emergency Department (ED) at hospitals, with or without a shared reception where walk-in patients are triaged by the GPC to the most suitable form of emergency care. To establish a baseline of the walk-in burden the percentages of self-referrals in ED in the Netherlands in 2012 were assessed.

METHOD

This cross-sectional study was carried out by questionnaires at 95 EDs. The study year was 2012. The relationship

with proximity of a GPC and the effects of a shared reception/GPC triage were investigated. The influence of region, urbanization and distance to town center was also taken into account.

RESULTS:

Out of the 95 EDs, 69 (73%) responded. The average percentage of self-referrals was 28.7%. Highest level of self-referral was seen in the densely populated provinces of Noord-Holland, Utrecht and Zuid-Holland, with 40.6, 36.8 and 33.7% respectively. In the rural areas of Zeeland and Drenthe the level was lowest, at 3.2 and 5.8% respectively.

A GPC was situated at the ED in 44 EDs (64%), 9 (13%) of which had a shared reception and triage. With a shared reception ED walk-ins were 23%. With co-location but no shared triage, the percentage of self-referrals at the ED was 26%. Without co-location walk-in patients were 35%.

Urban EDs (situated in one of the 15 largest towns in the Netherlands) had 42% self-referrals, compared to 22% for smaller towns.

CONCLUSIONS:

There are significantly more walk-in patients in urban EDs compared to rural EDs. When there is co-location with a GPC, the walk-in figure drops significantly in this cross-sectional inventory study.

OP-173

The Avro City family medicine health center successfully setup at Duhok. Family Medicine in Northern Iraq: now more than ever. A joint Kurdish/Dutch initiative

Johannes Mulder¹, Rajab Hassan Sanaan²

¹Consultant Family Medicine/General Practitioner, Zwolle, Netherlands

²Directorate General of Health / Family Medicine program – Duhok / Iraq

BACKGROUND-AIM: Free primary healthcare is often centered around primary health care centers (PHCC). Key attributes of FM doctors, as distinguished from regular PHCC doctors, are implementing generalism (broad skills and ability to treat), continuity (returning to same doctor, medical records) and personal approach.

In 2013 we started the project "Family Medicine in Northern Iraq: now more than ever. A joint Kurdish/Dutch initiative" in which initial research into the problems was followed by an implementation program.

METHOD

One of the projects involved the creation of dedicated FM centers. Avro City family medicine health center (ACFM) was created for this purpose last year with Dutch GPs who introduced FM elements such as chronic disease protocols, patient record information system, open desk building design and waiting room with patient education and thorough patient communication skills. At ACFM there are 5 consultation rooms with three Dutch FM doctors and 2 local FM doctor trainees treating patients one at a time according to the Dutch FM history/physical exam SOEP (subjective, objective, evaluation, plan) with an electronic patient record system (EPRS) demanding ICPC classification. They are assisted by specialized FM nurses and laboratory staff who perform onsite diagnostics (eg EKG, Spiro) and laboratory testing (Hb1Ac, bloodwork) and patient planning with agendas for organized, individual FM consultation. Whole families are entered into EPRS with parameters like occupation and health risk factors. Furthermore patient referral is arranged when necessary.

RESULTS:

ACFM was successfully set up last year, in accordance with the FM implementation project guidelines adhering to the Dutch FM model. The main problems encountered were financial and organizational.

CONCLUSIONS: Implementation of first line healthcare for whole families in accordance with FM principles has effectively commenced and most set-up problems have been overcome.

The use of teleconsultation to support the decision making process in the Brazilian Primary Care system
Lucas Wollmann, Milena Rodrigues Agostinho, Elise Botteselle De Oliveira, Luana Jonata Nunes De Moura, Erno Harzheim
Telehealth Network of State University of Rio Grande do Sul

Backgrounds & AIMS: The program TelessaúdeRS (Telehealth Network in the state of Rio Grande do Sul (RS), Brazil) aims at qualifying the practice of professionals of Primary Care (PC), assisting in making clinical and managerial decision. For this, it makes use of information and communication technologies for distance health-related activities. In March 2013, a toll-free telephone service was created to facilitate the task of PC professionals in real time by providing answers to the doctors and nurses through teleconsultations by phone, based on the best scientific evidence available, adapted to local needs and following the principles of the National Health System of Brazil.

METHODOLOGY: The service is available for doctors from all over Brazil's public PC system as well as nurses from RS. The teleconsultation starts when the professional calls for free the line: 0800 644 6543. After a first check to confirm the professional's registration number, the connection is passed on to a general practitioner (mainly family physicians) or to a nurse. The teleconsultant responds to questions in real time and If necessary the teleconsultant may require support from other specialists.

RESULTS: From March 2013 to March 2015, there have been 14.799 teleconsultations processed. As for the professional category of the callers, doctors accounted for 97.2%, and nurses for 2.8%. Among users having answered the satisfaction survey, 99% reported being satisfied or very satisfied with the service. 76% of referrals to other types of care were avoided from the total of teleconsultations initially requiring for a referral.

CONCLUSIONS: The system proved to be very useful tool since it provides a teleconsultation system with agility and good scientific evidence, of great assistance and managerial support for the Primary Care professionals. Developing a strategy to increase its use as well as integration of electronic records in health care is therefore essential.

Primary Care Referrals And Communication Of Patients With Family Practitioners

Yasemin Kılıç Öztürk¹, Ayşegül Bayad¹, Yusuf Adnan Güçlü¹, Kurtuluş Öngel²

¹Izmir Tepecik Training and Research Hospital, Family Medicine Clinic, Izmir, Turkey

²Izmir Katip Celebi University, Faculty of Medicine, Department of Family Medicine, Izmir, Turkey

INTRODUCTION: Although referral system is widely used all over the world; unfortunately it is not a routine practice among the primary health care system in Turkey. Aim of the study is to investigate the referral status of patients admitted to a tertiary district hospital and their communication with their family practitioners.

METHODOLOGY: The study is conducted during october and september in 2014 at Konak District Hospital of Tepecik Training Hospital, which was formerly used as a delivery hospital. Face to face questionnaire is applied to patients older than 18 years.

FINDINGS: Four hundred and seven patients, 321 (78.9%) female and 86 (21.1%) male, were included in the study. Patients who never admitted to a primary care center was at a rate of 14.5% (n:59). Referral rate was 6.9% (n:28). Most of the referred patients were female (n:24; 85.7%). When communication of participants with family doctors was questioned; 311 (76.4%) of them described the condition; as "well" or "excellent". At least four times admission to health care centers was reported at a rate of 53.3% (n:15) among the referred patients. There was a significant difference between gender and self reported communication conditions of patients with their family practitioners'. Women reported their communication as "well" or "excellent" at a rate of 81.3% (n:261); while 58.2% among men. (p<0.001)

RESULTS: Referral rate was found to be very low. The rate of patients who never admitted to a primary care center was very high. Most of the patients have better manner about their communication with their family

practitioners'. Although female have a better communication with their family practitioners'. It may be due to the follow up visits for the 15- 49 aged women. Therefore, education of women about the primary care and referral systems may lead to increase referral rates.

Bolsa Família Program and the access to health of low income families of a city in the northeast of Brazil

Carla Santos Araújo, Aristóteles Homero Dos Santos Cardona Junior, Adam Das Almas Trancoso, Adson Gileade Cavalcante Do Vale, Artur Alves Da Silva, Camila Guedes Silva Pires, Eduardo Rafael De Lucena Costa Barbosa, Felipe Augusto Morais De Souza, Grace Evelyn Sarinho Gomes, Jéssica Tamires Souza Santos, José Everton Fagundes Da Silva, Luana Thaís Dos Anjos Leite, Láyla Moanna Araujo De Moraes, Michel Neri De Barros, Marcela Amorim Do Vale, Maria Eugênia Chaves Franca, Marília Branco Freitas, Nathia Maria Lorena Da Silva, Odara Ribeiro Miranda Caires, Raíssa Rocha De Holanda Vasconcellos, Stenio Wagner Sacramento Da Costa, Rafael De Abreu Maynard, Anderson De Almeida Pereira, Lino Martins De Oliveira Sobrinho, Davi Rios Do Nascimento
Federal University of Vale do São Francisco Foundation

Introduction

The Bolsa Família Program (BFP) is the largest government program of direct transfer of income in the world that aims to reduce socio-economic vulnerability of families whose income does not exceed € 22,00 EUR per capita per month. It is demanded that families fulfill requirements related to health and education to maintain the benefit, such as nutritional monitoring of children and school attendance. Programs focused on reducing socioeconomic and health inequity can positively impact on controlling diseases linked to poverty. Identify epidemiological data on health conditions of children can be important for evaluating program effectiveness in fulfillment of its goals. This research aims to evaluate the access to primary health care services among children and pregnant women of families that are BFP beneficiaries.

Results

There were 68 (41.97%) beneficiary families in the sample. There were 102 children between 0 and 9 years-old in those families. Among the analyzed children, 89.02% had an adequate body weight, according to the WHO Growth Standards. A satisfactory prenatal care was done in 95.96% of the pregnancies. Among the 36 2-years-old children of the sample, 86.11% were cared monthly by a Family Health Professional Team.

Methods

That was a quantitative-descriptive study, which used data from the Introduction to Integrated Infant Health Research, realized in the Jose e Maria's neighborhood (Petrolina, Pernambuco, Brazil) by the League of Family and Community Medicine of the Vale do São Francisco Federal University in 2014, 162 families were interviewed. The UNIVASF Ethic Committee has approved the study.

Conclusion

The study identified that the children have appropriate follow-up by the public health service and adequate weight, indicating absence of malnutrition and almost all of the women performed satisfactory prenatal care. These results are very positive, considering that the population studied is in the largest group of socioeconomic vulnerability in Brazil.

⁴Department of Pharmacology, Izmir Katip Celebi University, Izmir, Turkey

⁵Family Medicine Center, Izmir, Turkey

Background and AIM: Faulty measurements of CO may negatively affect the smoking cessation treatment. The exact measurement of CO must be performed within 1-2 hours after smoking. Here in our study, we aimed to investigate the relationship between the time elapsed since the last cigarette was smoked (TLC), and the amount of CO measured in the expiratory air (ExpCO) and the addiction levels of the smokers.

METHOD: This study had a cross-sectional design. Upon receiving the ethical approval, face-to-face interviews with the Fagerström test for nicotine dependence (FTND) were carried out with the participants. The amount of ExpCO of the participants was measured by the breath CO monitor. TLC of the participants were examined. The SPSS 15.0 for Windows statistics package program was used for the statistical evaluation of the data. $p < 0.05$ was considered to be significant.

RESULTS: 441 patients, of which 57.4 % were male, were enrolled in the study. Mean age of the patients was 43.2 ± 12.9 (range: 17-82), mean pack-years was 24.0 ± 16.4 (range: 1-100). TLC values in males were significantly lower than women ($p = 0.001$). A mid-level negative correlation was detected between ExpCO and TLC for both

sexes (M: - 0.434, p<0.001; F: - 0.535, p<0.001). FTND scoring showed 21.8% (n:96) of the participants had very high level of addiction, while 24.9% (n:110) had high and 22.0% (n:97) had middle-level of addiction. A significant positive correlation was showed between FTND score and ExpCO (E: 0.391, p<0.001; K: 0.471, p<0.001). CONCLUSION: Measures of breath CO levels later than 3 hours of smoking may yield lower results which may decrease the therapeutic compliance. Therefore accurate timing of measurement is crucial in the successful management of smoking cessation treatment and struggle with the tobacco addiction.

The Ecology of Care and it's Global Variants

Otto Pichlhöfer, Kathryn Hoffmann, Manfred Maier
 Medical University of Vienna

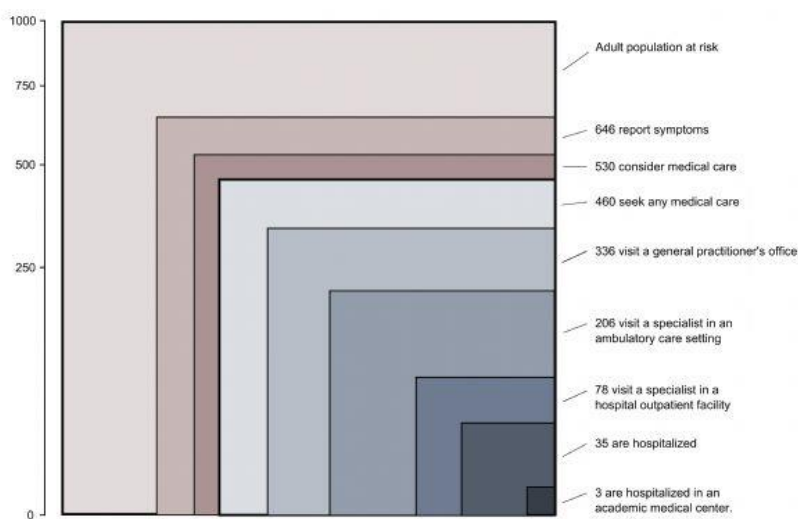

EOHCARE was a study designed as a CATI aided telephone survey of 3.500 Austrian individulas 16 years of age or older. The 35 item questionnaire assessed the utilization rates (UR) of health care services. We found very high URs especially at the secondary and tertiary care levels. The UR on the tertiary care level was four times of that reported by LA Green in 2001. A contributing factor to this overutilization and other week primary care functions — in the areas of continuity of care and coordination of care — is an unregulated patient access to all levels of care in Austria.

This presentation will review further international research that employed the “Ecology Model” of health care as originally proposed by K White in 1961. We will relate the various factors that contribute to the differences in URs at the different levels of care to health outcomes in a countrywise comparison.

Overall this work should contribute to a clarification of the role of Primary Care and clarify the factors that enhance its development under different health care systems.

Are there any differences in sick-leaves between rural and urban region in Croatia: a longitudinal study, 2001-2013

Vesna Tabak¹, Natasa Ban Toskic²

¹Family Practice „Dr. Vesna Tabak“, Breščenskog 3, Zagreb, Croatia

²Health Centre Zagreb-Centar, Martićeva 63a, Zagreb, Croatia

Background & aims

In Croatia, for more than six decades, people have recognised sick leave as a main right of employment, and it has been well regulated. Only family doctors keep the responsibility for sick leave certificate; each absence from the working place should be confirmed by the doctor's certificate. The survey on the trends of sick-leaves shown that the sick leave rates fell only slightly in fourteen-years with regional differences. This study is based on previous and it was carried out with the aim to investigate if there are any differences in the seek-leaves regarding rural, semi-rural and urban areas.

Methods

A study was observational and retrospective based on the official Croatian health insurance fund (CHIF) data. Annual number of patients on sick leave, the annual number of sick leave days, the average duration (in days) of sick leave per patient and the seek-leave rates were obtained for Croatia and separately for rural, semi rural and urban regions.

Results

Total sick leave rate was varying between 3.3 in 2001 and 3.96 in 2007 and with decreased trend to 2.85 in 2013. The highest sick leave rate was in urban (3.87) and the lowest in rural areas (3.23). Moreover, the higher sick leave rates were perceived during whole observed period in urban, slightly lower rates in semi-rural and the lowest in rural areas. The number of sick leave days and the number of patients on sick leave, with some oscillations, remained the similar. The average number of sick leaves days per one patients was continuously higher in urban areas of Croatia.

Conclusions

During the observational period, the differences in sick leave rates and average number of sick leaves days per one patients were observed; they were always higher in urban than in rural areas.

⁵Department of Public Health, College of Medicine, National Cheng Kung University, Tainan, Taiwan, ROC

BACKGROUND: To explore health indicators including social and behavioral parameters among young adults in 2 workplaces in southern Taiwan.

METHODS: In accordance with the project of 2014 National Fitness Test, 652 young adults 23-34 years of age were recruited from workforce of an amusement park and a steel factory. All subjects completed physical fitness test (body mass index, 1 minute sit-ups, sit-and-reach, 3 minutes step test) and filled out the questionnaire, information of age, sex, monthly average income, education, marital status, hours of sleep in work days and off days, electronic media use, diet habit, smoking, betel nut chewing, self-rated BSRS-5 (5-item-Brief Symptom Rating Scale) score, happiness, healthiness and life satisfaction were collected with informed consent. The results of physical fitness test were further categorized into five grades of fitness according to the national norm provided by Administration of Sport of Ministry of Education of Taiwan. The predictors of psycho-social and physical fitness were explored by logistic correlation. All analyses were performed using SPSS software version 18.

RESULTS: There were significant difference in age, sex, monthly average income, education, marital status, hours of sleep in off days, hours of mobile phone use, smoking, betel nut chewing, self-rated BSRS-5 score, happiness, and healthiness between 221 subjects from amusement park and 431 subjects from steel factory. Predictors of higher BSRS-5 score included female (OR=3.85), less sleep hours in work days (OR=1.45 for every 1 hours less). Predictors of unhappiness included working in steel factory (OR=1.97), current smoker (OR=1.81). Predictors of overweight included male (OR=3.55), working in steel factory (OR=1.96). Predictors of poor 3 steps test result included working in amusement park (OR=1.72), monthly income less than 20,000 NTD (OR=2.63).

CONCLUSIONS: Health status of young adult in workplace is heterogeneous. Effort and resources in workplace health promotion should be tailored to their special needs.

OP-181**Methotrexate: We can do better. A novel approach to safer use of toxic medication**

Diarmuid Quinlan¹, Paul Ryan¹

¹Dr Diarmuid Quinlan, Dept of General Practice, University College, Cork, Ireland.

²Dr Paul Ryan, Dept of General Practice, University College, Cork, Ireland.

Background and AIMS:

Ireland has four times more methotrexate related deaths than England. Audit of my GP practice revealed methotrexate monitoring was both sub-optimal and non-compliant with new Irish Medicines Board(IMB) guidelines.

We undertook a multi-practice, interdisciplinary, patient focused, audit to make our entire town a safe haven for Methotrexate use.

METHOD:

We developed a patient held low cost "ALERT" card, educating and empowering patients.

We presented audit outcomes and "ALERT" card to 169 local GPs, 100 pharmacists and 25 hospital consultants, to inform, share and disseminate learning.

Engaged with GP software I.T. provider to embed safety notices for methotrexate.

Patients surveyed about perception of "ALERT" card.

Methotrexate AUDIT criteria:

For patients taking Methotrexate assessed whether

1. Blood testing BNF compliant.
2. Prescribing compliant with IMB guidelines.
3. Patient vaccinations compliant with national guidelines.
4. Patient education compliant with IMB guidelines.
5. Patient "immunosuppressed" prominently documented in the clinical record.

RESULTS: Impact and Improvements demonstrated:

-Appropriate (BNF recommended) blood testing: improved from 21% to 95% patients. Excessive blood testing curtailed, maintaining patient safety while reducing practice workload.

-Prescribing compliant with IMB guidelines: improved from zero to 65% patients.

-Vaccination status: improved from 63% to 85%.

-Patients surveyed; unanimously agreed "ALERT" card improved their understanding of methotrexate "It explains everything".

-Documented "immunosuppressed" improved from Zero% to 94%. Use of electronic "pop up alerts" increased from 7% to 30%. Local oncologist proposed "cross pollinating" "ALERT" card to patients receiving toxic chemotherapy medications.

CONCLUSION; Clear focus on patient empowerment, multidisciplinary collaboration, aligned with smart use of existing IT: This yielded significant audit proven, sustainable, improvements in patient safety. Electronic dissemination of both audit template and "ALERT" card facilitate easy, widespread dissemination and implementation.

Patient perceptions and expectations from primary health-care providers in India

Rashmi Ardey¹, Rajeev Ardey²

¹Dr Rashmi Ardey, Department of Family Medicine, Karuna Medical Center, Tkbd Extn, New Delhi, India

²Dr Rajeev Ardey, Department of Family Medicine, Karuna Medical Center, Tkbd Extn, New Delhi, India

INTRODUCTION: The study of patient satisfaction at the primary care level has been mostly neglected in India.

AIM: This objective of

this study was to assess indices of Patient Satisfaction at the level of the family physician which is usually the first point of contact

between the patient and the health-care system. MATERIALS-METHODS: This study was carried out at a Private Primary HealthCare

Center in a semirural area in New Delhi, by exit interviews in the form of a questionnaire from patients randomly selected

from people visiting the center during the study period. Statistical Analysis: Descriptive statistical analysis was carried out on

the data collected. RESULTS: The findings revealed that 83.58% of the patients were satisfied with the general experience and the

behavior of the health-care provider and 85.9% were satisfied with the treatment and care provided, only 65.5% were satisfied with

the physical environment of the clinic. However, the percentage of patients who would recommend the facility to their friends was

overwhelming (94.6%). CONCLUSION: These results show that private health-care providers are still the first choice for any form of

medical care. However, there was definitely a gap between the increasing expectations of the patients for more information, better

Patient-Provider interaction, more control over the treatment process and better amenities even at the Primary Care level. It is this

gap, which needs to be fulfilled to facilitate better utilization of Primary Health-Care Services in the community and reduce pressure

on tertiary care services in order to ensure Universal Health Coverage. This study would also help us understand the challenges for

Primary Care service providers, private and public, in a low socioeconomic urban setting.

Enhancing quality in family practice: refreshing insight in skills and functioning of the Dutch GP

Stijn Van Den Broek

Dutch College of General Practitioners, Utrecht, Netherlands

Background & AIM:

Collecting and evaluating feedback about the way you are functioning as a doctor is mainstream during the education for GP's. Once the education is completed and doctors are practising as a GP this kind of feedback is less obvious. However it's a common belief and policy that continuous feedback and learning about one's functioning is necessary for keeping patient care professional and safe. The Dutch College of GP's developed a system of continuous feedback. "Self-Assessment, "Multisource feedback" and a personal development interview form essential elements of a medical appraisal of individual performance. The program that will be launched is called: 'Visitation Program for reregistration as GP'.

METHOD:

In 2011 a research and pilot for the evidence and experiences of doctor performance assessments had been carried out and the first experiences with 86 GP's were successful. Preparations to make a program available for all Dutch GP's have been made in 2013 by developing a form of multi-source feedback, which has been established in a second pilot. Also discussion leaders have been educated and evaluated. The last phase finished in December 2014 by developing and evaluating an infrastructure to implement this program.

RESULTS:

Based on international knowledge and experiences and evaluations of pilots, the visitation program was made as a compulsory item for reregistration as GP by the Dutch Registration Council of Medical specialists. From January 2015 all Dutch GP's can participate. During presentation the first experiences will be published.

CONCLUSION:

Medical appraisal of individual performance by Dutch GP's is a new item for reregistration as GP in Holland and enhances personal development and collaboration with colleagues in the interest of professional patient care. The Dutch Visitation Program made by the Dutch College of GP's provides a professional and self supporting, web-based system which can be used for years.

Keywords: functioning GP self assessment multisource feedback visitation program

OP-184

Do Primary Care Physicians Comply with ADA Guidelines in Diabetes Follow-up Visits?

Jihane Naous, Grace Abi Rizk

Department of Family Medicine, Saint Joseph University, Beirut, Lebanon

Background & Aim – Previous researches showed quality gaps in diabetic follow-up visits which might limit complications screening and risk factors control. This study measures physicians' adherence to guidelines to improve quality of care.

Method – All diabetic patients' medical files were retrieved from two Lebanese primary care centers. Eleven ADA-2013 guidelines were studied.

Results – There were one hundred and ten diabetics' medical files. The mean age of the patients was 62 years and the sex ratio 1. Physicians applied 5.1 ± 2.1 of the 11 studied guidelines. Regarding physical exam, blood pressure was taken in 75% of the visits, weight in 33% and the diabetic foot exam was done to 23% of the patients.

Concerning preventive measures, annual eye examination was ordered in 31% of the cases, influenza vaccine was recommended in 8.3%, aspirin was correctly prescribed in 80% and smoking status was documented in 58% of the files. As per laboratory exams, annual lipid profile was ordered in 75.5%, A1C in 1.31 ± 0.9 times per patient per year, creatinine in 63% and microalbuminuria in 52%. The mean of A1C was 8.03%, fasting glucose 163 mg/dl and LDL cholesterol 107.0 mg/dl. Microalbuminuria was detected in 54% of the cases. 73.5% of the patients had blood pressure $\leq 140/80$ mmHg, 28.2% had A1C $\leq 7\%$ and 45% had LDL cholesterol ≤ 100 mg/dl. There was no significant statistical relation between adherence to guidelines and achieving therapeutic target goals, while score adherence was higher when the visit was supervised by another physician.

Conclusions – Achieving target goals is a multifactorial process. Increasing awareness of the disease among diabetic patients could improve their compliance to the doctors' recommendations, while quality control of the visit and the file helps in full screening. Applying a check-list is likely to ensure a complete visit.

OP-185

Measuring transitional patient safety culture between general practice and hospital

Marije Van Melle, Henk Van Stel, Niek De Wit, Dorien Zwart

Department of General Practice, Julius Center for Health Sciences and Primary Care, University Medical Center Utrecht, Utrecht, The Netherlands

Background and AIM:

Patient safety is at risk when patients cross from one healthcare setting to the other. Precondition for improving the safety of these care transitions is a constructive safety culture between primary and secondary care. Aim of this study is to explore the perceptions of transitional patient safety culture among caregivers in general practice and hospital care.

METHOD:

We conducted a cross-sectional survey on patient safety in transitional care between Dutch primary care practices and hospitals. A digital questionnaire (TRACE) was dispersed in two regions, containing three hospitals and 62 general practices. The TRACE consisted of five dimensions: Collaboration, Transition, Freedom of feedback, Communication regarding incidents and improvement measures and Transitional patient safety. Items were scored on a 5-point Likert-scale

RESULTS:

189 healthcare professionals responded (response rate 33%): 65 from general practices and 124 from hospital. The data showed no strong dimensions -in which over 75% of respondents scored 4 and over. Moderate dimensions were "Collaboration" and "Freedom of feedback". Weak dimensions – in which over 50% of respondents scored 3 or less- were "Transition" (71% score 3 or less), "Communication regarding incidents and improvement measures" (85% score 3 or less) and "Transitional patient safety: (63% score 3 or less). These results

show that both general practice and hospital perceive mutual collaboration as suboptimal. The healthcare professionals acknowledge that things go wrong when patients transfer between general practice and hospital and vice versa. In addition, they rate overall transitional patient safety moderately which suggests room for improvement. Nonetheless, general practice and hospital do hardly communicate with each other about incidents and improvement strategies, even though they indicate feeling free to give and receive feedback.

CONCLUSIONS:

Patient safety culture is currently suboptimal. Especially mutual communication on incidents, risks and improvement measures should be stimulated

Keywords: Patient safety, Culture, transitional care

Caring for patient safety between general practice and hospital

Leida Reijnders¹, Antoinette De Bont², Niek De Wit¹, Dorien Zwart¹

¹Julius Center for Health Sciences and Primary Care, University Medical Center Utrecht, Utrecht, The Netherlands

²Institute of Health Policy and Management, Erasmus University Rotterdam, Rotterdam, The Netherlands

Background

Transitions between general practice (GP) and hospital, such as discharge, referrals and medication continuity are identified as high-risk situations. Describing the differences in patient safety culture between GP and hospital is necessary for developing an intervention that improves transitional patient safety. This study aims to explore the experiences, perceptions and attitudes of healthcare professionals concerning transitional care and transitional patient safety.

Methods 14 focus group discussions on experiences, risks, solutions and the role of cultural differences regarding transitional patient safety were conducted with either general practitioners, or hospital care providers (n=105). Template analysis was used to analyze the data.

Results Both GPs and hospital care providers identified the same risks for transitional patient safety: delayed discharge letters, incomplete medication information and lack of communication in general. Overall, GPs didn't have sufficient knowledge of the working methods in hospitals and vice versa. Indeed, their working contexts differ substantially on patient populations, epidemiology of diseases and organizational structure. In contrast to the consensus about risks, GPs and medical specialists talked markedly different about patient safety incidents. While GPs focused upon specific incidents, hospital care providers merely focused upon generic problems. Where GPs' expressions indicated a personal approach, hospital care providers expressed a more managerial approach. In addition, our participants revealed difficulties in loyalty felt towards each other or to their mutual agreements on transitional care processes. Furthermore, the so-called no man's land between general practice and hospital, which actually characterizes transitional patient safety, was mentioned as detrimental to patient safety.

Conclusion

Both GPs and medical specialists identify the same risks, however, their working contexts as well as their attitude towards patient safety differs. We hypothesize that these differences affect loyalty to each other and broaden the no man's land between general practice and hospital. This complicates the improvement of transitional patient safety.

OP-187

Reconciling medication between different healthcare levels

Alejandro Abon¹, Lourdes Martin¹, Carmen Plaza², Garcia Pilar¹, Peralta M Luz¹, Villimar Ana Isabel¹, Gangoso Ana¹, Dodero Javier², Barba Raquel³

¹Dirección Asistencial Oeste, Gerencia de Atención Primaria, Madrid, Spain.

²Dirección de Continuidad Asistencial, Hospital Universitario Rey Juan Carlos, Madrid, Spain

³Dirección Médica, Hospital Universitario Rey Juan Carlos, Madrid, Spain

Background and Aim

Medication mistakes are one of the leading causes of morbidity among chronic patients. These are frequently the result of treatment miscommunication between professionals at different healthcare levels.

The aim of this study is to implement a medication reconciling strategy between 9 primary care centers and their referral hospital.

Method

Nine rural and urban primary health care centers of the western part of the Community of Madrid and their referral hospital, University Hospital King Juan Carlos, were selected for the project. The electronic medical record and other tools such as the e-visit (online medical evaluation integrated in the electronic medical record) and the email were used to reconcile medication. The reconciling process was established both at admission and discharge during the month of March, 2015.

Results

Reconciling strategy at admission: using the electronic record, any doctor in the hospital may inform the liaison nurse about medical discrepancies. The liaison nurse is the person in charge of the communication between both healthcare levels. This information is passed to the primary care center where the family doctor clarifies the discrepancy by means of the specific reconciling e-visit.

Reconciling strategy at discharge: the doctor and nurse at the primary care center revise the hospital discharge report through their direct access to the hospital electronic record.

Conclusion

The reconciling medication strategy increases patient safety and decreases potential medication mistakes among different healthcare levels. Strategies like these are required as long as there is no shared medical record between different levels.

OP-188

New type 2 diabetes guideline implementation at primary care in Ukraine: results, barriers and optimization

Victoria I Tkachenko

Shupyk National Medical Academy of Postgraduate Education

Background. New diabetes care guidelines was developed with our participation and approved in Ukraine since 2012. The content of primary diabetes care and quality indicators (QI) were indicated at first. The aim - to evaluate the quality of diabetes care, results and barriers of diabetes guidelines implementation. Materials and methods. We proposed complex data analyses, which included quality indicators monitoring, analysis of data from outpatient cards, statistical reports of medical facilities and survey of 536 general practitioners-GPs (using modified and validated GUIDANCE questionnaire) and survey of 459 diabetes patients with ADDQoI19 and DTSQ questionnaires (Bradley&Spleight, 2002). Statistical analysis - using Excell-2007, SPSS. Results. GPs'knowledge of diabetes guideline and adherence to its implementation in 2013-2014 are insufficient as quality of care, quality of life (AWI=-3,58±0,47points) and treatment' satisfaction (26,49±0,75points). The GPs'self-reported outcomes of diabetes care correlated to objective data from statistical reports and may be used during assessment. The 1st QI is development of local protocol that was barrier for GPs. We developed typical local protocol, it was approved by Health Ministry. The 2nd QI is percentage of patients with identified glycosylated hemoglobin, it was 8,84% in 2012, 12.2% in 2013 and remains low. The 3rd QI - percentage of admitted to hospital patients - increased from 8,66% in 2012 to15,01% in 2013. It can be explained by insufficient equipment of primary care, limitation in free laboratory tests, low economical level and low adherence of patients to self-management. The 4th QI is annual monitoring of patient' condition that is difficult to collect without electronic medical records. We developed a template for GP for collecting data, developed and implemented postgraduate course for GPs to optimize diabetes primary care. Conclusion. The quality is insufficient at early stage, the availability of laboratory tests at primary care and implementation of electronic medical records will improve.

Prescribing quality in primary care physicians in Aktobe, Kazakhstan: a cross-sectional study

Lazzat Manbetzhanovna Zhamaliyeva¹, Mukhit Nauryzgalievich Turebayev², Akmaral Mukhanbetovna Altayeva², Aigul Sakariyevna Mussina³

¹Department of Continue Professional Development and Evidence Based Medicine, West Kazakhstan Marat Ospanov State Medical University, Aktobe, Kazakhstan

²Department of Family Medicine

³Department of Propedeutics of Internal Diseases

BACKGROUND: Adherence to principles of family medicine and evidence based rational prescribing increases the quality of health care and patient outcomes. In this study, the quality of drug prescription in primary care physicians in Aktobe city of Kazakhstan was assessed for the development of special education trainings. METHODS: a retrospective cross-sectional study was conducted to determine the current prescribing practice. Data of 480 randomly selected patients attending the primary care clinic in Aktobe were extracted from the manual medical records. The World Health Organization recommended indicators were used to evaluate the physicians' prescribing habits: the average number of drugs prescribed per encounter, the percentage of drugs prescribed by generic name, the percentage of encounters with an antibiotic and injections prescribed, percentage of drugs prescribed from an essential drug list. RESULTS: The median age was 37 years. Prescription analysis showed that the average number of drugs per prescription was 2.05. Assessment of prescribing indicators revealed over-prescribing of antibiotics among general physicians, basically for acute respiratory viral infections (31,5%). The percentage of encounters in which an injection was prescribed was 15.4%. The percentage of drugs prescribed by generic name was 36,4%. The

percentage of drugs prescribed from National Drug Formulary was 90.5%.

CONCLUSIONS: The results obtained in this study indicated non-rational prescribing. A larger study involving several clinics is warranted to assess the prescribing quality in primary care in Kazakhstan. We believe that the development of certain policies and continuous education is extremely important for quality drug prescription.

Keywords: primary care, quality indicators, prescribing practice

OP-190

Problem List: quality improvement of medical records in a Portuguese family health unit

Pedro Azevedo, Luís Pinho Costa, Cristiana Azevedo, Elisabete Castro, Sónia Moreira, Inês Souto
Unidade de Saúde Familiar de Fânzeres, Gondomar, Portugal

INTRODUCTION: Being central to the medical record, the Problem List highlights factors that can affect clinical management. However, its usefulness varies due to lack of consensus on the inclusion criteria, making it essential for teams to adopt a standardized approach that ensures data quality.

OBJECTIVES: Having observed criteria heterogeneity among our team, we've implemented a quality improvement cycle to increase the proportion of problems abiding by criteria meanwhile established by the team.

METHODOLOGY: We assessed the baseline proportion of criteria-abiding problems using a simple random sample of patients (May 2013). Criteria compliance was assessed by two reviewers and kappa statistic was calculated. For the next quarter year we delivered an intervention consisting of: weekly analysis of examples, individually and by the team; weekly training of the lists update on the electronic medical record software; c) daily screensaver reminding the criteria in use; d) always available PDF summarizing the criteria. In September 2014 we reassessed per the same methods used at baseline. We compared the proportions over time using the chi-square test. The quality standard (QS) was defined by team consensus: <70% insufficient, 70-79% reasonable, 80-89% good, ≥90% excellent.

RESULTS: 2101 problems were analyzed at baseline (352 patients, 48 ± 23 years; 57% women; κ inter-rater 0.83) and 2610 at reassessment (384 patients, 53 ± 24 years, 58% women; κ inter-rater 0.96). The proportion of criteria-abiding problems increased significantly (p <0.0002) from over 80% (QS: good) to over 90% (QS: excellent).

DISCUSSION: The intervention increased the proportion of criteria-abiding problems to levels of excellency, allowing for care of the highest quality and safety. The authors envision subsequent quality cycles aimed at assessing problems being under-registered, outdated, redundant or inappropriately coded according to ICPC-2.

OP-191

Using Information to Improve Coordination of Care

Karen Kinder, Craig Pollack, Klaus Lemke

Bloomberg School of Public Health, Johns Hopkins University, Baltimore, Maryland, USA

- **Background**

Patients with poorly coordinated care are likely to have more costly and lower quality health care due to factors such as excess utilization resulting from redundant investigations, potentially harmful missed drug-disease interactions, and lower patient satisfaction. Therefore, the identification of patients at risk of poor coordination is essential. This presentation will address the impact of information on improving coordination of care across the spectrum of the health care system.

- **Method**

The Johns Hopkins ACG® System includes four complementary coordination markers as well as a coordination risk score to systematically assess the risk of poor coordination of care. In combination, the markers can identify populations at risk for poor coordination which has implications for cost, quality, and performance assessment.

Studies have shown that when clinicians share patients with other clinicians more frequently, they are more likely to have referral relationships. A measure of patient sharing among physicians, termed “Care Density”, assesses the number of individual clinicians a patient sees and the degree to which those clinicians share other patients. The Care Density measure is based on the hypothesis that patients seen by clinicians who share patients more frequently have higher levels of communication and information sharing.

- **Results**

A recent study of the Care Density measure on 9,596 patients with congestive heart failure and 52,688 with diabetes demonstrated a significant correlation between lower inpatient costs and rates of hospitalization amongst those patients with high Care Density. Also, for diabetic patients with high Care Density, lower outpatient costs and higher pharmacy costs were found.

- **Discussion**

Through a better understanding of how patients are shared amongst clinicians, as well as identifying those patients at risk of uncoordinated care, coordination can be improved, rates of hospitalization reduced and potential cost savings achieved.

OP-192

Teaching Family Medicine Residents About Quality Improvement Practices Utilizing a Chronic Kidney Disease Co-management Project Involving Family Physicians and Nephrologists

Jerry W. Sayre

Mayo Clinic, Jacksonville, Florida, USA

Early identification and treatment of chronic kidney disease (CKD) allows for the provision of optimal patient care, slowing the risk of progression to advanced chronic kidney disease. Primary care physicians are the providers of the initial diagnosis, treatment, and referral, when necessary, for optimal patient care. Controversy and conflict occasionally exists among primary care physicians and nephrologists regarding the appropriate timing of these referrals. For example, recent clarification of CKD stages has not been uniformly accepted among all physicians. Another potential source of conflict has been gaps in the follow-up communication loops among the nephrologists, the referring physicians, and the patients. The Renal Physicians Association (RPA) has developed a validated communication toolkit to facilitate this process. Medical students are exposed to quality metric

concepts but have had little experience in developing and using quality improvement practices in patient care settings.

This project extends and uses the findings from a recent qualitative study of nephrologists and primary care physicians, involving the RPA CKD Toolkit, to introduce quality improvement practices to Family Medicine residents.

A pre-intervention survey is administered to assess residents' current knowledge of quality improvement processes. Family Medicine residents are given didactic instruction in quality improvement principles, followed by workshops involving experiential learning focused on identification and utilization of CKD toolkit items.

Residents then utilized this knowledge in communication with selected nephrologists, evaluating the potential utilization of quality improvement communication practices. Residents demonstrated their understanding of the quality improvement principles in CKD by verbal presentations to peers and core faculty.

This is proving to be a useful educational practice to train residents in both the methodological modalities of quality improvement and the usefulness of improved communication practices.

Validation of the Turkish Version of the Personal Feelings Questionnaire (PFQ 2): A measure for the tendencies to feel ashamed and guilty

Canan Tuz, Mehmet Ergun Öksüz

Başkent University, Family Medicine Department

Lewis (1971) in her contribution " Shame and Guilt in Neurosis" introduced that in shame the focus is on the global self, while in guilt the focus is on a specific behavior. In order to distinguish these emotions in various mental disorders quantitative assessment of shame and guilt using self-report questionnaires can help. One of the most popular questionnaires is Personal Feelings Questionnaire (PFQ 2) (Harder& Zalma, 1990) This study sought to validate a Turkish version of the PFQ-2.

A sample of 229 undergraduates completed the Turkish PFQ2. This study was conducted during March-April 2015 in Başkent University.

Factor analysis was performed to assess the underlying domain structure of the questionnaire and to evaluate validity, the degree to which each item is related to the hypothesized domain with which it is associated. The reliability was calculated by using Cronbach's alpha formula.

Based on clinical interpretations of a principal-components analysis, 2-domain structure was identified which included of Principle Component Analysis and Varimax rotation (Eigen Value ≥ 0.7). Scale with this nine domains expanded variance was %88.1. Item loadings were found between 0.465-0.853. The value of the scale was in level high reliability (Cronbach Alpha: 0.949). Subdomains were similar to the original survey as guilt and shame.

The PFQ2 exhibited satisfactory internal, and discriminant validity similar to the original American version. Moreover, the gender difference in shame and guilt was replicated.

This dispositional measure of shame and guilt was the first made available in Turkish and offers acceptable psychometric qualities.

Keywords: guilt, shame, validation, reliability, personal feelings questionnaire

⁷Mehmet Akif Ersoy ASM, Adana, Turkey

⁸Gazi ASM, İstanbul, Turkey

"Bugün bir hasta geldi" I had a patient today is a facebook group of Turkish family physicians. Where they discuss daily cases and ask to colleagues. Physicians add their current opinions and evidence about topic.

We investigated all case entries added through 2014 and cross checked if the cases are covered equally at board curriculum.

Our case discussion group consist of 678 physicians mostly family physicians and practitioners practicing as GPs and hospital specialists like radiologist, cardiologist, dermatologist etc and family physician academicians.

Practicing physicians comes with the patient and the question and people discuss on the topic, based on discussions, further investigations or new treatment options can be ordered. After these, case presenter discuss the progress of case. Minimum 2-3 cases added on daily base and all cases are answered in the same day. Discussions done by personal opinions bur are also supported by guidelines or current evidence.

This patient discussion group is all driven by daily routine and needs. In our presentation we will share discussion topics which were shared during 2014. We will sort topics of cases like Diabetes, arthritis, COPD etcç We will also present distribution of cases through medical topics like radiology, obstetrics, endocrine, pediatrics, infectious disease, orthopedics, respiratory, cardiology etc. Finally we will argue if it is in parallel with and covered by FP board curriculum and Turkish family physician textbooks.

Analysis of referrals from family doctors to Tallinn Children`s Hospital emergency room

Agne Liiskmann¹, [Helen Ling](#)¹

¹Tartu Ülikool

²Perearstikeskus Sinu Arst

³Pirita Perearstikeskus

Background and AIM: Tallinn Children`s Hospital (TCH) is the main provider and consulting hospital of specialised paediatric health care in Northern Estonia. The hospital has four emergency rooms (ER) with different profiles: internal medicine, otorhinolaryngology (ORL), surgery, and trauma ER.

The aim of this study was to evaluate quality of family doctors' referral letters, to determine the most frequent referral diagnosis and to compare our results of hospitalisation rate with the hospital's own statistics.

METHOD: We analysed retrospectively 397 referrals from family doctors to TCH internal medicine, ORL and surgery ERs in 1.01.-31.03.2014. We excluded referrals from other hospitals and specialities, and incompletely scanned referrals.

RESULTS: Out of 379 cases 39% (155 patients) were hospitalised, 61% (242 patients) were ambulatory. Hospitalisation rate was higher for those who were referred in all three emergency rooms: 55% in internal medicine (overall hospitalisation rate 21%, p-value >0.0001), 28% in surgery (15% overall, p-value 0.0034), and 13% ORL (7% overall, p-value 0.0155). Only 1.5% (7 letters) of the sample did not have a referral diagnosis. History of disease and physical findings were described on 83% and 75% of referrals, respectively. The overall health history is also important in paediatrics, but only 14% of the referrals described patient's previous development and/or vaccinations. The five most common referral diagnosis were as follows: otitis media 19% (77 cases), of those 65% were serous otitis media; pneumonia 14% (57 cases); bronchitis 7% (29 cases); appendicitis 6% (24 cases) and stomach ache 5% (19 cases).

CONCLUSION: Hospitalisation rate is greater among referred patients than overall. Quality of referral letters is quite good but improvements can be made in describing patients development and growing.

Keywords: Tallinn Children`s Hospital, family doctors' referral

The use of Family Medicine by the Families: a qualitative study

Arzu Uzuner¹, Pemra Ünalın¹, Delican Oğuzhan², Ali Yapakçı², Aylin Altun², Sefa Semih Atal², Cemre Hilal Kesen²

¹Department of Family Medicine, Marmara University Medical School, İstanbul, Turkey

²Marmara University Medical School, İstanbul, Turkey

INTRODUCTION: Family Physicians are expected to provide a comprehensive and individualized primary health care service by a family and community based, holistic approach. In Turkey Primary Health Care is recently based on Family Medicine model. Do the families use the Family Medicine or how they use.

METHODS: This qualitative study is structured as focus group meetings with families. Nuclear or large families using different primary care centers in different cities were recruited in the study to reflect different opinions. The groups were formed by 6-9 participants and each focus group lasted 30 to 110 minutes. All the groups were audio taped and transcribed. Thematic analysis was performed based on the transcripts by all the researchers, by dual cross reading and by the final analysis in the whole group. An independent researcher contributed to the final assessment.

RESULTS: A total of 26 focus group meetings have been held in five different cities; 72 families (n=165) participated in focus group meetings. Mean age value of the participants was 40.3±17.2; 57.5% of them were female and 54% were educated <8 years. Main themes that emerged were; 1-Use of family medicine by the families; 2- Observations and comments related to the health care practice; 3- Prejudices about primary health care services; 4- Expectations of and suggestions for family medicine; 5- description a “normal family doctor”.

DISCUSSION: Families receive individually and limited services from family doctors; families are not aware of services that could be expected from family physicians. Families have perception that family doctors deal with more simple health problems than other doctors. Families with elder members and children use more family medicine, due to its easy accessibility. Gender can be a challenge for the doctor-patient relationship.

Keywords: family medicine, primary health service, use

OP-197**A qualitative exploration of the experience of living with epilepsy in the mid-west region of Ireland**

Jennifer Mullen, Ray O'connor, Breda Carroll, Gerard Garrett, Sinead Gavin, Grainne McNally, James Moloney, Toireas Moriarty, Ciara O 'riordan, Ciara O'sullivan, Gerald Wheeler
Department of General Practice, University of Limerick, Ireland

BACKGROUND:

Epilepsy is a chronic condition with associated biological and psychosocial effects. Epilepsy is unique because of the stigma and psychosocial burden associated with it.

Aims and OBJECTIVES:

The aim of our study was to evaluate the emotional and psychosocial impacts of living with epilepsy, as well as the role of culture and society which can affect an individual's experience and their approach to treatment.

METHODS:

This study adopted a prospective, qualitative design using Interpretative Phenomenological Analysis (IPA) methodology.

A purposive sample of 12 people with epilepsy was recruited from the registers of General Practices in the Mid-West region of Ireland. Semi-structured face-to-face interviews were conducted to talk about the personal meaning of living with epilepsy. Audio recordings were transcribed verbatim. Themes that emerged as representative of the content were then identified.

RESULTS:

Fear, of seizures, of rejection, of embarrassment and of stigma was a recurring issue. These perceptions had a direct negative effect on mental health.

There was an overlap between feelings of fear and perceived stigma, issues affecting compliance with medication, and perceptions regarding side effects and prescribing choices.

There was also a relationship between feelings of stigma, the perceived need for secrecy and concealment felt by some of the interviewed patients, and feelings of discrimination, both socially and in a work life context.

Many of the patients experienced feelings of guilt in a social context, and a perception of being a "burden" to their families. Many also stated that epilepsy affected them in forming relationships.

There was a general sense of limited independence, compounded by driving restrictions and a sense of frustration with perceived and real barriers to achieving academic and professional goals.

CONCLUSIONS:

Our study provides several insights into the emotional and psychological aspects of living with epilepsy.

Keywords: epilepsy, psychosocial, emotional, stigma, perception

²Primary Health Center Centro. Santander. Spain

³Primary Health Center Alisal. Santander. Spain

⁴Primary Health Center Los Carmenes. Madrid.

⁵Sierrallana Hospital. Torrelavega. Spain

Background & AIM: To analyse the characteristics of the medical assistance given to immigrants in a primary medical care centre.

METHODS: A descriptive transversal study of the immigrants attended to, for any reason, in an urban primary medical care centre during 2012. The average and standard deviation (in the case of normal distribution) was used for quantitative variables, and percentages for qualitative variables.

RESULTS: 601 immigrants were seen (12.9% of the total number), with an average age of 37.95 (SD 12.3), mainly female (77.7%), mainly of South American origin (63.9%), followed by immigrants from Eastern countries (28.6%) and Africans (5.5%). Consultations mainly took place on a Friday (22.6%); there were no home visits; the average number of motives for each consultation was 1.42. 38.4% had some kind of test or complementary treatment, 42.4% were referred to other departments, mainly gynecology (16.7%), blood tests (26%) and temporary sick leave (14.3%). If the causes are classified by CIPSAP-2, we obtain "X genitourinary illnesses" (27%), "XIII osteoarticular and connective tissue illnesses" and "VI nervous system and sense organ illnesses" (9.7%) By specialist department, gynecology/obstetrics (25.8%), trauma (17.6%), and pneumology (12%) were the most frequent. 55.5% received a prescription for an acute motive (anti-inflammatory medicine (37.9%), antibiotics (6.6%)), and 17.7% for a chronic motive (contraceptives (14.2%), pregnancy supplements (13.2%).

CONCLUSIONS: Attention given to the immigrant population represents a very small percentage for the total. The profile of the typical user is a young woman, of South American origin, seen mainly for a gynecological reason. There are no home visits. Almost half required treatment or tests following the consultation, mainly referral to another consultant or specialty. Very few required chronic medication.

Analysis of the control of the risk factors in diabetic patients. Are we really making it worse?

Alvaro Perez Martin¹, Maria Jose Agueros Fernandez², Jose Ramon Lopez Lanza³, Antonio Alonso Gonzalez¹, Patricia Noemi Aguilera Samaniego¹, Maria Teresa Garcia Gutierrez¹, Alfredo Avellaneda Fernandez⁴, Cecilia Traspuesto Pascual¹, Isabel Muñoz Franco¹, Maria Antonia Gandara Revuelta², Nuria San Miguel Martin¹, Carmen Huidobro Dosal¹

¹Primary Health Center Centro. Santander. Spain

²Primary Health Center Zapaton. Torrelavega. Spain

³Primary Health Center Alisal. Santander. Spain

⁴Primary Health Center Los Carmenes. Madrid.

Background&AIM: A comparative study of the degree of control of diabetic patients in primary medical care and in hospitals, comparing the degree of control and the attitude of the physicians.

METHOD: A transversal, descriptive study of diabetic patients selected from three primary medical care quotas (by order they appear on the list). In order to calculate a correct control, the values recommended by the ADA 2015 were used (blood pressure <140mmHg and <90 mmHg, LDL <100mg/dl). In order to assess renal failure, a <60 filtration rate was considered. For quantitative values, averages and standard deviations were used (in the case of normal distribution), and percentages were used for qualitative variables.

RESULTS: 98 subjects were selected. The characteristics of the patients are (primary vs. specialised), average age 72.66 vs 57.3; mainly females (50.6% vs 47.4%). The average values encountered were HbA1c 7.2 vs 8.4%, glycemia 143.1vs164.7, LDL 101.8 vs 108.5mm/dl, SBP 143 vs 139mmHg and DBP 75.6 vs 77.5mmHg, 54.5% vs 36.8% had a good control of their BP, 55.8% vs 55.6% of their cholesterol. With regards to treatment of high blood pressure, 54.5% vs 36.8% used monotherapy. For those that did not fulfill the objectives, in 77.8 vs 95.2% of the cases, the doctor did not carry out any further treatment for BP, and in 96.2% vs 97.4%, there was no further treatment for cholesterol.

CONCLUSIONS: The degree of control of blood pressure and cholesterol levels in diabetic patients is very deficient at both primary care level and at hospital level, and do not fulfill the recommendations given by the main international guides. Both levels make few changes to high-risk patients. Treatment should be intensified and therapeutic inertia should be avoided.

OP-200

Quality of life of women with breast cancer: Middle East perspective

Ghufran Jassim

Department of Family and Community Medicine, Royal College of Surgeons in Ireland, Bahrain

PURPOSE: The objective of this study is to describe the quality of life of Bahraini women with breast cancer and its association with their sociodemographic and clinical data.

METHODS: This is a cross sectional study in which the European Organization for Research and Treatment of Cancer Quality of Life was administered to a random sample of 337 Bahraini women with breast cancer. Relevant descriptive statistics were computed for all items. The equality of means across the categories of each categorical independent variable was tested using parametric tests (ANOVA and independent t-test) or non-parametric tests (Kruskal Wallis and Mann Whitney tests) of association where appropriate.

RESULTS: Of the total sample, 239 consented to participation. Participants had a mean score for global health of 63.9 (95% CI 61.21-66.66). Among functional scales, social functioning scored the highest (Mean 77.5 [95% CI 73.65-81.38]) whereas emotional functioning scored the lowest (63.4 [95% CI 59.12-67.71]). The most distressing symptom on the symptom scales was fatigability (Mean 35.2 [95% CI 31.38-39.18]). Using the disease specific tool it was found that sexual functioning scored the lowest (Mean 25.9 [95% CI 20.23-31.60]). On the symptom scale, upset due to hair loss scored the highest (Mean 46.3 [95% CI 37.82-54.84]). Significant mean differences were noted for many functional and symptom scales.

CONCLUSION: Bahraini breast cancer survivors reported favorable overall global quality of life. Factors associated with a major reduction in all domains of quality of life included the presence of metastases, having had a mastectomy as opposed to a lumpectomy and a shorter time elapsed since diagnosis. Poorest functioning was noted in the emotional and sexual domains. The most bothersome symptoms were fatigability, upset due to hair loss and arm symptoms. This study identifies the issues that most need to be addressed in this Middle East society.

Keywords: Quality of life, Breast cancer, Women

OP-201

Presentation of respiratory symptoms prior to diagnosis in general practice: a case control study examining free text and morbidity codes

Richard Andrew Hayward, Ying Chen, Peter Croft, Kelvin Jordan
Keele University, Staffordshire, UK

Background and Aim

General practitioners can record patients' presenting symptoms by using a code or free text. We compared free text entries of breathless and wheeze symptoms with coded symptom information recorded prior to diagnosis of ischaemic heart disease (IHD), chronic obstructive pulmonary disease (COPD), and asthma using a case-control design.

Methods

The setting was eleven General Practices in North Staffordshire UK contributing to the Consultations in Primary Care Archive (CiPCA) database.

Cases with an incident diagnosis of IHD, COPD, or asthma in 2010 were matched to controls (four per case) with no such diagnosis. All prior consultations with codes for breathlessness or wheeze symptoms between 2004 and 2010 were identified. Free text of cases and controls were also searched for mention of these symptoms.

Results

592 cases were identified, 194 IHD, 182 with COPD and 216 with asthma. 25% of cases and 5% of controls had a prior consultation for breathlessness. Prevalence of a prior coded symptom of breathlessness or wheeze was 30% in cases, 6% in controls. Median time from first coded symptom to diagnosis among cases was 57 weeks. After adding symptoms recorded in text, prevalence rose to 62% in cases and 25% in controls. Median time from first recorded symptom increased to 144 weeks. The associations between diagnosis and prior symptom codes was strong: IHD OR 3.21,(2.15, 4.79); COPD OR 9.56,(6.74, 13.60); asthma OR 10.30,(7.17, 14.90).

Conclusions

There is an association between IHD, COPD and asthma diagnosis and earlier consultation for respiratory symptoms. Symptoms are often noted in free text by GPs long before they are coded. Free text searching may aid investigation of early presentation of long-term conditions using GP databases and are an important direction for future research.

"Risk factors of mortality in patients with chronic obstructive pulmonary disease"

Iris Nathalie San Roman Arispe¹, Ines Cruz Steve¹, Josep Montserrat Capdevila², Pere Godoy I Garcia⁴, Josep Ramon Marsal³

¹CAP Primer de Maig Lleida

²CAP Mollerussa Lleida

³Instituto Universitario de Investigación en Atención Primaria "Jordi Gol" Lleida

⁴Unidad Epidemiología Lleida en Generalitat de Catalunya

OBJECTIVE: To identify risk factors of mortality in patients with chronic obstructive pulmonary disease (COPD).

Design: A retrospective cohort study.

Location: Study on risk of overall mortality was carried out for the period 11/01/2010 – 10/31/2013 in diagnosed population of COPD in primary care in a Health (Lleida, Spain)

Participants: 2.501 patients older than 40 years with at least a spirometry in the 24 months prior to the beginning of the study were followed for 3 years.

Main measurements: The dependent variable was the overall mortality; and the independent: spirometric parameters, severity (GOLD) and clinical variables. Their association with mortality was analyzed by calculating the adjusted odds ratio using a non-conditional logistic regression model.

RESULTS: The average age of 2.501 patients at the beginning of the study was 68.38 years (SD=11.6) and the 74.97% of which were males. The 50.82% had a mild severity COPD, followed by the moderate (35.31%), severe (9.44%) and very severe (4.44%). The mortality rate for the all period was 12.55%. The variables of the predictive model were: age, sex, previous exacerbations, number of visits to the primary care, comorbidity, smoking, severity of COPD (GOLD) and influenza vaccination, with an ROC curve of 0.76.

CONCLUSIONS: The model, easy and quick to apply, would identify those patients at increased risk of mortality and who could benefit from preventive strategies to improve their survival.

Keywords: Chronic Obstructive Pulmonary Disease (COPD); Risk Factors; Mortality.

OP-203

(Elderly Healty Rotation: What Does Family Medicine Residents Think About?)

Olgu Aygün¹, Nilgün Özçakar², Mehtap Kartal²

¹İZMİR LOKAL HEALTH AUTHORITY, KARABAĞLAR 2 FAMILİY HEALTH CENTER

²DOKUZ EYLÜL ÜNİVERSİTESİ

AIM: As elderly population increase, care of elderly becomes more important in daily practice of family physicians. Their needs should be well known, properly assessed and managed. "Elderly health" training during residency is a new issue in Turkey, and first rotation is planned for residents in Dokuz Eylul University. The aim is determine the opinions of residents about their elderly health rotation in Narlidere Geriatric Care Center and Residential Home.

METHOD: The qualitative study included first 12 residents who had the rotation. Semi-structured in-depth interviews and descriptive analysis was performed.

RESULTS: Main themes: 1-Opportunities in the educational process in the elderly health rotation, 2-Challenges, and constraints experienced in the educational process 3-Recommendations regarding the educational process, 4-Tutorial characteristics, 5-Content and structuring of education.

Residents' statements:

"...Because they are both physiologically going backwards, and losing some advantages, renal function, etc... may

be something can be discussed on how to approach a group who are using an increasing number and types of drugs.”

“...It has sections where home care patients have more professional support. It is fine for it; I think it would be helpful...”

“...Alzheimer's patients were many. This group is the one that we didn't manage before...”

“...Some can be seen in outpatient clinic and shared but it's different with inpatient... How to flip side a patient, how their beds or, bedsides should be?”

“...However, a program should be made with relevant consultancy. Given tasks, what should be done or talked about the work-flow and theoretical lectures and also it could be more appropriate to plan the context and the schedule...”

CONCLUSIONS: Efficient training programs for residents about seniors' health needs in family medicine residency with interdisciplinary collaboration will make great contributions to improve their quality of life. There is a need for further studies for residents' perceptions and demands.

The prevalence of hypertension and obesity in children and adolescents is increasing in most countries with high and middle income

Giovanni Colucci¹, Enza Colucci¹, Paolo Motolese¹, Fabrizio Pastore¹, Fabio Robusto³, Paolo Vinci², Pietro Cirillo⁴, Vitantonio Colucci⁵

¹General Practitioners Asl Ta 5 Martina Franca, Taranto, Italy

²Pediatrician Asl Ta 5 Martina Franca, Taranto, Italy

³Mario Negri Sud-Santa Maria Imbaro's institue, Chieti, Italy

⁴Department of Nephrology Polyclinic Bari, Italy

⁵Engineer Martina Franca, Taranto, Italy

Adiposity is driving force for cardiovascular disease. **OBJECTIVES:** draw epidemiological profile overweight/obesity (S/O); define through Hypertension (IA), BMI (Body Mass Index), waist circumference (CV) how many children are to cardiovascular risk; identify children with urinary disorders (microscopic hematuria, proteinuria / microalbuminuria) correlate with S/O and IA; correlate children's physical inactivity with feeding. Enrolled 935 children (Martina Franca), average age 9.48 (SD = 1.02) 9.52 median age (MIN 6.51 – MAX 12.05). Are measured: blood pressure, BMI, CV, urinalysis to fresh, questionnaire on habits life (sports, sedentary lifestyle, food four daily meals). Data evaluated based on age and gender with cut-off of growth. In multivariate logistic regression Males were independently associated with S/O: M, OR: 1.517, CI: 1163-1979, p <0.01. We defined "prehypertension" blood pressure values 90th - 95th percentile, while "manifests hypertension" blood pressure \geq 95th. In logistic regression adjusted for age and sex, S/O with OR of 5.04 had hypertension. M (OR: 1.79, CI: 0543-2145, p: 12.46), age (for each year OR: 0.885, CI: 0638-1227, p: 12.46), S/O (OR: 5.041, CI: 2325-10931, p <0.001). S/O with OR of 3.47 had prehypertension. M (OR: 1.038, CI: 0593-1816, p: 0.90), age (for each year OR: 1.391, CI: 1053-1850, p: 0.02), S/O (OR: 3.469, CI: 1943-6194, p <0.001). Proteinuria / microalbuminuria is associated to hypertension and age. M (OR: 0.708, CI: 0389-1290, p: 12.26), age (for each year OR: 1.884, CI: 1378-2576, p <0.001), hypertension (OR: 4.946, CI: 1.838 - 13,314, p <0.0). Microscopic hematuria is weakly associated with hypertension and markedly with age. IA is correlated in logistic regression with abdominal obesity (OA) and not with S/O. OA (OR: 3.720, CI: 1237-11188, p <0.02). No correlation between S/O and have snack or breakfast, also sedentary activities and sports. Attention of General Practitioners, to correct lifestyle, can improve cardiovascular risk in childhood.

Keywords: overweight/obesity, hypertension, proteinuria / microalbuminuria, cardiovascular risk

Tackling Problems in West Bank using Design Thinking during the International Development of Family Medicine in Palestine Course

Walid Tarda¹, Israa Alassa², Nawal Abusarhan¹, Lubna Alsaudi¹, Charilaos Lygidakis³, Paul Wallace⁴

¹Faculty of Medicine and Health Sciences, An-Najah University, Nablus, Palestine

²Primary Healthcare Beitlehem, Beitlehem, Palestine

³Vasco da Gama Movement

⁴University College London, UK

Background & Aim

The International Development Family Medicine Programme in Palestine West Bank (IDFMP) aims to support the development of Family Medicine (FM) in Palestine through training, academic exchanges and a leadership development. Its first initiative was a one-week course for the residents of the Palestinian FM specialty programme at the An-Najah University in Nablus in November 2013. Among the activities of the course, the participants analysed the issues of the Palestinian FM applying the Design Thinking methodology and explored potential solutions.

This presentation aims at providing a subset of the results of that session.

Method

Nineteen FM residents participated in the course and were divided into four groups. Following the human-centric Design Thinking methodology, each group brought into discussion a challenge of the Palestinian FM. First they interpreted the challenge, identified the stakeholders and defined the problem appropriately. Second, they brainstormed ideas and chose the most feasible ones according to the context and resources. Finally, they prepared presentations and prototypes of the solutions with the use of role-plays and storyboards.

Results

Among the problems noticed by the groups, there were the scarce time and continuity, the lack of medical records, the overwhelming patient expectations, and the sense that Family Doctors were not respected by patients and colleagues. By analysing the challenges, their processes and stakeholders, the participants brainstormed many ideas: train the other specialists on FM, establish joined meetings among doctors of all specialties, increase communication among the clinics, introduce a gatekeeping system, increase the training sites for FM, launch public information campaigns, and encourage the newly graduated doctors to join the specialisation.

Conclusions

The Design Thinking sessions helped the course participants clarify the needs of primary care in Palestine and how to overcome these by employing a Build-Measure-Learn loop.

Incidence and treatment of heavy menstrual bleeding in general practice - {Data from a dynamic cohort, the Netherlands}

Marian J. van den Brink, Anne Linde Saaltink, Feikje Groenhof, Marjolein Y. Berger, Yvonne Lisman Van Leeuwen, Janny H. Dekker

Department of General Practice, University of Groningen, University Medical Center Groningen, The Netherlands
BACKGROUND: Heavy menstrual bleeding (HMB) is a common problem in women of reproductive age. Less is known of the incidence of HMB in primary care and the treatment strategy used. Since the revision of the Dutch College of General Practitioners' (GPs) guideline on Vaginal bleeding in 2008, the levonorgestrel intrauterine system (LNG-IUS) plays a more prominent role and is recommended as an equal treatment option to oral medication.

AIM: To investigate the incidence and treatment of women with HMB in primary care and to compare this treatment with the Dutch guideline on Vaginal bleeding.

METHOD: Data from a dynamic cohort including 46.467 patients, derived from the Registration Network Groningen, The Netherlands was used. We selected women visiting the GP for HMB from January 2004 until January 2014. Data of medication prescription, number of visits and referrals were collected.

RESULTS: In a 10 year period, 881 women visited the GP with HMB as a new complaint. The mean incidence of HMB was 6.5 per 1000 women per year. In the three months following diagnosis, 46% of women were treated with hormonal medication, in 44% of cases no medication were started. Within one year of diagnosis, 15% of women were referred to the gynecologist. There was a significant decrease in the percentage of oral progestogens prescriptions during 10 years ($p < 0.05$), no trend was seen in the number of LNG-IUS prescriptions.

CONCLUSIONS: The incidence of HMB in this cohort was comparable to the incidence found in other studies. Women were treated most often with hormonal medication, mainly the oral contraceptive pill and oral progestogens. No significant increase in LNG-IUS prescriptions for HMB is seen in our study. Here is opportunity for improvement, since Dutch GPs are increasingly inserting the LNG-IUS for indications such as contraception in the past 10 years.

"Attitude and Behaviour of Hospital Workers on Healthy Diet"

Dilek Kusaslan Avci, Huseyin Avni Sahin, Hatice Tuba Akbayram

Department of Family Medicine, Medical Faculty of Yuzuncu Yil University, Van, TURKEY

AIM:

The aim of study is to determine the healthy lifestyle behaviours of hospital workers employed in Yuzuncu Yil University Hospital, Van, Turkey.

METHODS:

A total of 431 hospital workers were included in the study in a university hospital in Van.

Research data were collected with a questionnaire covering; nutrition consuming frequency, nutrition consuming behaviour, general health condition, body height, body weight and blood pressure, alcohol and cigarette consumption, exercise and socio- demographic characteristics.

RESULTS:

Smoking more than 10 cigarettes a day among physicians, nurses, and other employees were 77.7 %, 76.0 % and 31.3 % respectively ($p: 0.000$).

Alcohol consumption among physicians, nurses, and other employees were 20.2 %, 9.8 % and 9.5 % respectively ($p: 0.011$).

Starting the day without having breakfast among physicians, nurses, and other employees were 73.2 %, 55.5 % and 41.1 % respectively ($p: 0.002$).

Skipping the meals due to not having time to eat among physicians, nurses, and other employees were 45.6 %, 36.7 % and 41.1 % respectively (p: 0.003).

Eating fast food daily among physicians, nurses, and other employees were 11.1 %, 7.4 % and 0% respectively (p: 0.000).

Eating fast food at least once a week among physicians, nurses, and other employees were 73.2 %, 51.2 % and 41.7 % respectively (p: 0.000).

CONCLUSIONS:

According to study results lifestyle and dietary attitudes of health care workers were not as desired. As they are the role model for the rest of the population more time and care should be given to understand the reasons, so they may improve their attitudes regarding healthy diet and lifestyle.

Screening for heart failure and COPD in frail elderly with reduce exercise tolerance or dyspnoea: a cluster randomized trial

Yvonne Van Mourik¹, Frans H Rutten¹, Loes C Bertens¹, Maarten J Cramer², Jan Willem J Lammers³, Johannes B Reitsma¹, Karel G Moons¹, Arno W Hoes¹

¹Julius Center for Health Sciences and Primary Care, University Medical Center Utrecht, the Netherlands

²Department of Cardiology, University Medical Center Utrecht, the Netherlands

³Department of respiratory medicine, University Medical Center Utrecht, the Netherlands

BACKGROUND: Heart failure and chronic obstructive pulmonary disease (COPD) often remain unrecognized in older individuals. It is unknown whether screen-detecting these diseases really impact the management. We evaluated the effectiveness of a screening strategy followed by management at the discretion of the own general practitioner (GP) in 'frail' community-dwelling elderly.

METHOD: Cluster randomized clinical trial.

'Frail', pragmatically defined as multimorbidity and/or polypharmacy, persons aged ≥ 65 years with complaints of dyspnoea or reduced exercise tolerance were eligible for inclusion. General practices were randomly allocated to a screening strategy consisting of history taking, physical examination, blood tests, electrocardiography, spirometry and echocardiography. An expert panel decided on presence or absence of COPD and heart failure, and in such a case further management was at the discretion of the participating GP. In the other arm GPs provided usual care, that is, symptoms-driven diagnosis and management. All changes in medication and health care use during the six months follow-up were extracted from the electronic medical files of the GPs.

RESULTS: In total 18 practices were randomized and 829 patients participated; 389 in the screening strategy (eight practices) and 440 in the care as usual group (ten practices). More patients in the screening strategy received a new diagnosis of heart failure or COPD compared to usual care (cumulative six months incidence 34% vs. 2%, and 17% vs. 2%, respectively). In new detected heart failure, provided recommendations of the expert panel on pharmacotherapy were adopted by the GP in 33 (44.6%) patients. This was 16 (45.7%) in newly detected cases of COPD. After six months, health care use was comparable between the two strategies.

CONCLUSION: Screening for heart failure and COPD in frail elderly with dyspnoea or reduced exercise tolerance resulted in many newly detected cases, but not in reduced health care use compared to usual care.

Keywords: heart failure, COPD, screening

OP-209

Mortality predictors of H1N1 influenza outbreak in 2015

Pratyush Kumar¹, Atul Gogia², Atul Kakar²

¹Department of Family medicine, Sir Gangaram hospital, Newdelhi,India

²Department of Internal medicine, Sir Gangaram hospital, Newdelhi,India

Background & Aim

Worldwide H1N1 pandemic has been associated with increase morbidity and mortality. In India, a recent outbreak of H1N1 influenza has posed a serious challenge for health services with rapid spread across various states causing panic among public. The present outbreak data correlates clinico-laboratory findings with mortality.

Method

In a prospective observational study at tertiary care centre in Northern India data was collected from 1st January 2015 to 28th February 2015 related to H1N1 mortality in all patients tested positive using real-time reverse-transcription polymerase chain reaction testing on nasopharyngeal swabs.

Results

Data of 151 patients were analyzed. Majority of patients were above 40 years (55%) and range from age 3 months to 85 years with 47.6% females. Comorbidity was seen in 52.9% (Type 2 diabetes mellitus - 23.8%, hypertension - 25.8%) of the patients. The time between onset of symptoms and hospitalization ranged from 1 to 25 days. Documented clinical features were fever - 96.6%, dry cough - 86.09%, productive cough - 13.01%, dyspnea - 80.7%. Management included oseltamivir and antibiotics if indicated along with 66.8% of the patients required oxygen support, 22.5% required intensive care, 14.5% mechanically ventilated and 8% maintained on non invasive ventilation. Mortality was 8.6% in which all the patient were above 40 yrs of age ($P = 0.018$) and 88.6% were male. Mortality correlated significantly with elevated s. creatinine ($P = 0.03$), thrombocytopenia ($P = 0.037$), hyperbilirubinemia ($P < 0.001$), raised serum aspartate transaminase ($P = 0.003$) and serum alanine transaminase ($P = 0.001$). High risk factors such as pregnancy, diabetes and hypertension didn't correlate with mortality significantly. Patients requiring oxygen, intensive care and mechanical ventilation correlated significantly with mortality.

Conclusions

The mortality rate in our study was 8.6%. H1N1 influenza patients with deranged hepatic and renal parameters had poor prognosis.

The association between parity and blood pressure in Korean women: Korean National Health and Nutrition Examination Survey, 2010–2012

Mi Ae Jang, Ji Ho Choi, Yeon Ji Lee

Department of Family Medicine, Inha University Hospital

Background & AIM: Pregnancy brings significant changes in women's cardiovascular system, but the association between parity and blood pressure has not been clarified. This study aimed to investigate the association between parity and blood pressure in Korean women using the 2010-2012 Korean National Health and Nutrition Examination Survey.

METHOD: A total of 8,890 participants aged 19 years and over were categorized into two groups according to menopause in this cross-sectional study. Multivariable adjusted logistic regression analysis was used to evaluate the association between parity and blood pressure.

RESULTS: With increasing number of births, systolic and diastolic blood pressures decreased in premenopausal women ($\beta=-0.091(p<0.001)$ and $\beta=-0.069(p<0.001)$ respectively) and systolic pressure decreased in postmenopausal women ($\beta=-0.044(p=0.028)$).

CONCLUSIONS: This population-based study showed that increasing parity was associated with decreasing blood pressure in Korean women.

Keywords: parity, blood pressure, menopause

Trends in Statin Consumption and Cardiovascular Mortality in Croatia 2004 – 2012

Zeljko Vojvodic¹, Mladenka Vrcic Keglevic²

¹Zeljko Vojvodic, Family Practice "Dr Zeljko Vojvodic" Bijelo Brdo, Osijek, Croatia and Foundation for the Development of Family Medicine in Croatia, Zagreb, Croatia

²Mladenka Vrcic Keglevic, University of Zagreb Medical School, School of Public Health "Andrija Stampar", Zagreb and Foundation for the Development of Family Medicine in Croatia, Zagreb, Croatia

Background and aims

Prescribing of statins increased in all developed countries since 1995, growing at faster rates than other ATC groups. That rise was regarded desirable and beneficial, because of their unquestionable efficiency in controlling atherogenic dyslipidemia.

The aim was to research trends in statin therapeutic and financial consumption in the period from 2004 to 2012 as well as trends in cardiovascular mortality from 1980 to 2012.

Methods

Longitudinal, observational study, based on data on the use of statins, from Croatian Agency for Medicinal Products and Medical Devices, from 2004 – 2012, together with financial expenses (in EUR). Data on cardiovascular mortality in Croatia and several neighbouring countries were taken from the Croatian Health Statistics Yearbooks.

Results

Pharmaceutical consumption of statins increased from 28,1 DDD/TID in 2004 to 83.5 DDD/TID in 2012 (near 200%). The most frequently prescribed simvastatin and atorvastatin, rised at different rates - simvastatin 64%, atorvastatin 440% - from 8.8 DDD/TID in 2004 to 47.9 DDD/TID in 2010, with 50% drop in utilization rate in 2011 due to doubling of DDD for the C10 group.

Financial expenses for statins expanded at a rate of 53%, from 21.3 millions of EUR in 2004 to 32.4 millions of EUR in 2012. Their share in total drug expenses grew up from 4.25% to 4.87% in 2012.

As opposed to that, trends in standardized cardiovascular mortality, as well as mortality rates from ischemic heart disease and cerebrovascular disease continually declined in Croatia (and several neighbouring countries) since 1980s – from 551,65/100.000 to 351/100.000.

Conclusions

Utilization of statins in Croatia increased more than in any other therapeutic group, in the eight year period, while standardized cardiovascular mortality rates decreased in balanced linear mode.

Keywords: statin consumption, cardiovascular mortality, pharmaceutical spending

OP-212

Consumption of over-the-counter drugs in Croatia 2004 - 2013: longitudinal study

Alma Kurc Bionda¹, Darja Nelken Bestvina², [Zeljko Vojvodic](#)³

¹Alma Kurc Bionda, Family Practice "Alma Kurc Bionda" Đakovo and Foundation for the Development of Family Medicine in Croatia, Zagreb, Croatia

²Darja Nelken Bestvina, family Practice "Darja Nelken Bestvina" Osijek and Foundation for the Development of Family Medicine in Croatia, Zagreb, Croatia

³Zeljko Vojvodic, Family Practice "Zeljko Vojvodic", Bijelo Brdo, Osijek and Foundation for the Development of Family Medicine in Croatia, Zagreb, Croatia

Background & aims

Over-the-counter (OTC) drugs are medicines for use without a prescription from a healthcare professional, as compared to prescription drugs which may be delivered or sold only to consumers possessing a valid prescription. In many countries, OTC drugs are approved by regulatory agencies which ensure that they contain safe and effective ingredients that can be used without medical supervision. They are also the cornerstone of self-medication health care strategies. The aim of study was to investigate OTC drugs mostly used by Croatian population in period from 2005 to 2013.

Methods

Data on OTC consumption expressed in DDD/TID and as financial expenditure in Croatian kunas (HRK), were taken from annual reports of Croatian Agency for Medicinal Products and Medical Devices from 2005 to 2013.

Results

Trends in total OTC consumption, expressed in DDD/TID and in kunas, were increasing. During the observed period, the most used drugs were: acetylsalicylic acid, ascorbinic acid, vitamin B12, ibuprofen, paracetamol, bisacodil, oxymethazoline, betahistine, bromhexine and ginkgo biloba, all with increasing tendencies. The utilization of acetylsalicylic acid increased with the greatest rate, from 19.00 DDD/TID in 2005 to 57.24 DDD/TID in 2013, followed by ascorbinic acid, from 5.44 DDDs in 2005 to 10.22 DDD/TID in 2013 and vitamin B12, from 2.61 DDDs in 2005 to 9.13 in 2013. Consumption of ibuprofen (only 200 mg strength) also increased, switching the position on a rank list with paracetamol. Financial spending followed the trend of therapeutic.

Conclusions

Croatian population consumed OTC drugs in rather great quantities. The important questions are whether their family doctors are aware of this consumption and whether they take into account possible side-effects. It will be also interesting to investigate the role of health care professionals as potential generators of these trends.

OP-213

Multidisciplinary approach to treating obesity in a community health centre

Milena Blaž Kovač¹, Igor Švab², Antonija Poplas Susič¹

¹Community Health Centre Ljubljana, Slovenia

²Medical university Ljubljana

Background

Obesity incidence continues to grow. The main problems of treatment is low success rate and the poor longterm sustainability of reduced weight after completed programme. The most successful methods include multidisciplinary approach, but they are often poorly evaluated. In urban health centre in Ljubljana a long-term programme has been developed by multidisciplinary team of doctors, nurses and physiotherapists.

Aim

The aim is to evaluate short and longterm outcome of the programme with regard to cardiovascular risk factors and to determine the associations with social and demografic factors, upon preserving in the programme and the maintenance of a lower weight after the programme has been completed.

Method

The programme included the 6 months weight reduction part and 18 months of the weight maintenance part. 397 participants were recruited by their GPs and data were collected after 24 months. Logistic regression was used as a method of determining the factors of success and SPSS for statistical analysis.

Results

346 participants have completed the introductory part and 123 have completed the full programme. In the introductory the average weight loss was 12% of the initial weight. The participants who completed the full programme lost 9,4% of the initial weight. The values of blood sugar, cholesterol, systolic and diastolic blood pressures were significantly reduced. ($p < 0,05$) The factors associated with staying in the programme are age over 50 (beta= - 0,6219, $p = 0,015$), lower educational levels (beta= 0,6430, $p = 0,029$), lower initial weight (beta= - 0,0089, $p = 0,10$) and higher weight loss (beta= 0,0363, $p = 0,064$) in the introduction.

Conclusions

The multidisciplinary approach to obesity treatment was effective for a selective group of people. The proportion of dropouts was relatively high but still low compared to similar programmes.

Career pathways in family practice: A qualitative study of mid-career general practitioners

Lesley M Piko¹, Catherine Joyce²

¹Company Director, ACT Medicare Local Ltd

²Adjunct Associate Professor, School of Public Health & Preventive Medicine, Monash University and Senior Manager of Policy, Research and Service Innovation, cohealth

BACKGROUND & AIM: Career pathways can influence recruitment and retention of the general practitioner (GP) workforce, but there has been limited empirical investigation of career trajectories followed by GPs. We analysed qualitative data to describe the career development strategies used by GPs at the mid-career stage, and assessed the extent of fit with a 'portfolio' career model.

METHOD: This qualitative study used data from interviews with 99 mid-career GPs in Australia. We explored GPs' patterns of workforce participation and work activities, and the reasons for their choices about these.

RESULTS: GPs reported a range of ways in which they developed their careers at the mid-career stage. Most common was a 'depth' strategy, with four out of five GPs reporting at least one area of special interest practice.

Two thirds of GPs reported 'breadth' strategies, diversifying into other (non-GP) clinical and/or non-clinical work. Consolidation and maintenance of career were also prominent, and not necessarily mutually exclusive with 'depth' or 'breadth' strategies. Interestingly, nine out of ten GPs reported using more than one career development strategy, thereby highlighting the variation in GP career development.

CONCLUSIONS: Career development strategies adopted by GPs in our study are consistent with the 'portfolio' career model to some extent, illustrating a variety of roles and career trajectories. This research can assist with GP workforce recruitment by highlighting the diverse and challenging career pathways available. Similarly, professional organisations and practices can use the findings to support GP workforce retention. Planning for the GP workforce needs to take into account the amount of time GPs may spend in roles other than direct clinical service provision. Although increased non-clinical work may mean more GPs are required overall to meet demand for primary medical care, it also means more satisfied GPs who are likely to stay in the workforce longer.

OP-215

Mental Health in Out-of-Hours Service – informing the future direction of services

Claire Collins¹, Marie T. O Shea¹, Pearse Finegan¹, Dorcas Collier², Margaret Curran², John Cunniffe²

¹Irish College of General Practitioners, Dublin, Ireland

²Caredoc, Carlow, Ireland

Background and Aim

In Ireland it is estimated that 90% of mental health problems are dealt with by the general practitioner while 10% are dealt with by specialised mental health services. Much research into mental health has focussed on psychiatry and emergency departments, with somewhat less focussed on primary care. Within primary care little is known about the use of out of hours GP service by people experiencing mental health difficulties. This study describes consultations that are related to mental health issues attending one large out of hours primary care service in the South East of Ireland.

Method

Data was collected via an anonymous extraction of retrospective data from the out of hours' electronic database. Using a pre-defined list of terms, data were extracted to identify the number of patients over a one year period who attended with a possible mental health condition.

Results

Using 37 pre-defined key words, a total of 12,431 relevant consultations were identified in 2013. Approximately 6% of the consultations were excluded as they referred to cases < 18 years. Overall 61.5% of consultations were in respect of females, the mean adult age was 55 years and 46.6% of adult callers personally made the call to the service. The priority of the consultation at reception was considered an emergency in 10.6% of cases, urgent for 35.5% of cases and routine for the remaining 53.9%. Further data will be presented describing the reason for the consultation and referral patterns.

Conclusions

The findings from this initial phase shed light on the numbers of mental health consultations resulting in referral. It also informed a second phase of the study to establish the patterns of use of out-of-hours GP services by people presenting with mental health difficulties and knowledge about their adherence to a mental health service referral.

Keywords: mental health, primary care, referral

OP-216

Determinants of patient's and doctor's delay in diagnosis of gastric cancer in the Netherlands

Yunus Arik, Charles Helsper, Nicole Van Erp, Niek De Wit
Julius Centre for health and primary care, UMC Utrecht, Netherlands

Background and Aim

An efficient diagnostic process is important for reducing disease burden for gastric cancer patients. Duration of this process and its determinants are unknown for the Netherlands.

We aim to assess the duration of the different phases of the diagnostic process, and determinants of delay in these phases, for gastric cancer patients in the Netherlands.

Method

A retrospective case series using routine care data of gastric cancer patients, available from the Primary Care Network Utrecht (PCNU) database. Based on these anonymous free-text and coded data, the duration of the phases of the diagnostic process (called T1 to T3) was assessed: T1 - onset of symptom(s) to first consultation with general practitioner (GP); T2 – first GP consultation to referral; T3 - referral to final diagnosis. Median durations and interquartile ranges (IQR) were calculated in days. 'Delay' is defined as the longest quartile of phase duration. Determinants of delay are assessed using multivariable logistic regression analyses. Possible determinants are: patient-, complaint-, disease- and consultation related variables.

Results

Patient files 51 patients were eligible for analysis. The median time from onset of symptoms to final diagnosis was 128 days (IQR 61-213). Median duration of time periods was, T1: 17 days (IQR 3 to 42), T2: 22 days (IQR 4 to 66), T3: 34 days (IQR 15 to 56). The only determinant for which a suspicion of an association with delay was found was psychiatric morbidity in T2 (OR 2.27, 95%CI 0.93-5.57).

Conclusion

Dutch gastric cancer patients face modest delay in primary and secondary care. The variation in duration of each phase, particularly in time to referral by the GP, is substantial. Since time from referral to final diagnosis was relatively long, increasing efficiency of the secondary care diagnostic process is likely to be the most effective intervention to reduce delay.

Keywords: Delay, gastric cancer, diagnostic process, diagnosis, primary care

OP-217

Well-being of older cancer patients one year after diagnosis: results from the KLIMOP cohort

Marjan Van Den Akker¹, Laura Deckx², Tine De Burghgraeve², Carine Van Den Broeke², Doris Van Abbema³, Frank Buntinx²

¹Department of Family Medicine, Maastricht University, Maastricht, the Netherlands

²Department of General Practice, KU Leuven, Leuven, Belgium

³Department of Medical Oncology, Maastricht University Medical Centre, Maastricht, the Netherlands

Background & AIM:

To study occurrence and evolution of depression, cognitive functioning, fatigue and loneliness the first year after diagnosis of cancer.

METHODS:

The Klimop-study is an ongoing Flemish-Dutch cohort study (N=1495) consisting of older cancer patients (≥70 years), older patients without a previous diagnosis of cancer, and younger cancer patients (50-69 years). Data include depression, fatigue, cognitive functioning, and loneliness at baseline and one-year follow-up.

RESULTS:

The evolution of most psychosocial problems was similar for older and younger cancer patients: an increase in

depression, slight worsening in cognitive functioning, and no clear change in fatigue. Compared to people without cancer, differences were small. The initially lower scores for loneliness among older cancer patients increased over one year until they reached the scores of older patients without cancer. Main risk factors for depression, fatigue and cognitive functioning after one year were changes in functional status and presence of the problem at baseline. For loneliness, we found an increased risk for people who were persistently fatigued, and people who became or were persistently impaired on cognitive functioning.

CONCLUSIONS:

Despite lower levels of loneliness at baseline, after one year of follow-up, loneliness was comparable for older people with and without cancer. It looks as if family and friends cluster around older cancer patients to comfort them. Within a year, however, this effect fades out and loneliness levels increase to a level that is comparable to persons without cancer. The same trend occurs in other psychosocial problems; over the course of one year after a diagnosis of cancer, cancer patients, young and old, face increasing levels of depression and increasing difficulties in cognitive functioning. Since the main risk factor for psychosocial problems was presence of the problem at baseline, this calls for regular screening and exchange of information between different health care providers.

Keywords: cancer, older patients, well-being

OP-218

Clinical characteristics of patients with acute coronary syndrome visiting ordinary outpatient clinic

Hiroaki Wakakuri¹, Akihiro Tanaka¹, Taro Saigusa¹, Makoto Suzaki¹, Sonoko Kirinoki¹, Naoko Onodera¹, Takashi Araki², Hideya Hyodo¹, Toshihiko Ohara¹, Makoto Kawai², Masahiro Yasutake¹

¹Department of General Medicine & Health Science, Nippon Medical School, Tokyo, Japan

²Department of Emergency and Critical Care Medicine, Nippon Medical School, Tokyo, Japan

[Background & Aim] ACS (acute coronary syndrome) patients presenting with typical chest pain are commonly referred to cardiologists, admitted to coronary care unit and receive timely coronary revascularization therapy. However, many ACS patients without chest pain initially see generalists and tend to be subjected to delay and/or underuse of optimal treatment. The aim of this study is to clarify the clinical characteristics of ACS patients who visit our outpatient clinic of general medicine.

[Method] Forty five consecutive patients diagnosed as having ACS in our department were reviewed in the period between November 1, 2011 and February 28, 2015. We divided the patients into two groups: the ambulance group (n=21) who were carried by ambulance and the walk-in group (n=24) who came on foot.

[Results] The ambulance group (age: 67±12, M/F:15/ 6) consisted of 13 ST-segment elevation myocardial infarction (STEMI), 5 non ST-segment elevation myocardial infarction (NSTEMI), 1 recent MI, and 2 unstable angina (UA) patients. The walk-in group (age: 63±13, M/F: 19/ 5) consisted of 10 STEMI, 6 NSTEMI, 6 recent MI, and 2 UA patients. A proportion of ACS patients with no chest pain was higher in the ambulance group than in the walking group (48% vs 38%). The chief complaint of ACS patients with no chest pain in the ambulance group included nausea (n=6), dyspnea (n=3), and cervical pain (n=1). Likewise, patients in the walking group complained nausea (n=5), dyspnea (n=2), headache (n=1), and back pain (n=1).

[Conclusion] Generalists should always bear in mind a possibility of ACS, especially when patients are presenting with acute onset of nausea and/or dyspnea, regardless of admission route: by walk-in or by ambulance.

What is 'valid' knowledge? Mindlines, philosophy and virtual networks beyond EBM

Sietse Wieringa

Queen Mary University

BACKGROUND: Evidence based medicine holds high the ultimate need to weigh the findings of research in light of considerations of patients values and clinicians' expertise [1]. However, how valid and useful answers to clinical questions are found during this process largely remains a black box. A better understanding of how clinicians value and incorporate evidence from research in their clinical methods, including the use of intuition, heuristics and reasoning is called for [2].

Important empirical evidence regarding the integration of evidence in clinical practice comes from an ethnographic study in 2004 by Gabby and le May [3]. They found that GPs seldom use explicit knowledge (such as clinical guidelines) in everyday practice. Instead they heavily relied on inexplicit, tacit knowledge, practical routines and past personal experiences shared with and influenced by colleagues, dubbed 'mindlines'.

METHODS-RESULTS: In a systematic review we analysed 340 papers published since 2004 on mindlines. We identified several philosophical sophisticated perspectives that fundamentally unpack many of the assumptions underlying the EBM paradigm. Where conventional EBM limits itself to frequentist reasoning trying to find a single knowable truth, mindlines present us with multiple realities, alternative ways of reasoning and the concept of useful knowledge being 'created' instead of 'translated' in contexts and communities.

By further studying mindlines in theory and in practice as for instance in virtual social networks we may be able to increase the array of tools we use to develop valid knowledge and find what lies beyond the current EBM paradigm.

The "Voices of the Street Project" examines prevalence of Hypertension and Diabetes Mellitus in poor communities of Jundiaí - Brazil

Luiza Breuel Luz, Daniel Rosa Amaral, Eduardo Sasaki, Carolina Alice De Camargo Valente, Bárbara Breda Stella, Ângela Eugênio Rizzato, Marco Aurélio Janaudis, Suzana Guimarães Moraes

Voices of the Street, Jundiaí Medical School, Jundiaí, Brazil

Background & AIM: The "Voices of the Street Project" is a voluntary extension project of the Jundiaí Medical School, Brazil, which aims to integrate students and community, leading to health promotion to underserved areas and the formation of humanized professionals. METHOD: In this work, the project was to evaluate the prevalence of diabetes mellitus (DM) and hypertension (HTN) in poor neighborhoods in Jundiaí. RESULTS: The application of a questionnaire was made with the population in the city of Jundiaí, which featured a sample of 210 people, including 114 female, 96 male, mean age of 51.14 years, with a variation of 18 to 83 years. The project analyzed the prevalence of these diseases in these two districts and found that 15.24 % of the participants have DM; 35.24 % 12.9% have hypertension and DM associated with hypertension. CONCLUSIONS: Based on the data collected by the project, we observed a high incidence of hypertension and diabetes mellitus in the city of Jundiaí. By contrast, compared to the difficulty in collecting municipal data from other sources, reinforces the performance of epidemiological questionnaires applied to activities. With hard numbers, we can act more effectively in communities. In addition to promoting health in these neighborhoods, there is the benefit to the volunteer student because he is current on the prevalent diseases as well as in the preventive approach to their future patients, with a differential in their training.

Analysis of the smoking population. What is the perception of the usefulness of ICTs for smoking cessation?

Jose Manuel Trujillo Gómez¹, Laura Díaz Gete², Carlos Martín Cantera³, Mireia Fábregas Ecurriola⁴, Mónica Manzano Montero⁵, Lourdes Clemente Jiménez⁶

¹Institut Universitari d'Investigació en Atenció Primària Jordi Gol (IDIAP Jordi Gol), Barcelona, Spain

²Primary Healthcare Centre, La Sagrera, ICS, Barcelona, Spain;

³Primary Healthcare Centre, Passeig de Sant Joan, ICS, Barcelona, Spain

⁴Primary Healthcare Centre, La Marina, ICS, Barcelona, Spain

⁵Primary Healthcare Centre, Horta, ICS, Barcelona, Spain

⁶Primary Healthcare Centre, Santo Grial, SALUD, Huesca, Spain

Background and AIMS: Common interventions for smoking cessation are based on medical advice and pharmacological aid. Information and communication technologies (ICTs) may be helpful as interventions by themselves or as complementary tools to quit smoking. Determining the profile of the smoking population and knowing the perception of the utility of ICTs for smoking cessation who has the patients attended in Primary care we could elucidate the viability of an ICT intervention in smoking cessation in primary care.

METHODS: Descriptive observational study in 84 health centres in Catalunya, Aragon and Salamanca. We included by simple random sampling 1725 primary healthcare smokers aged 18-85. Through personal interview professionals collected Socio-demographic data and variables related with tobacco consumption, ICTs use and perception of the utility of ICTs for smoking cessation collected through face to face interviews. Data was analyzed by SPSS 17.0.

RESULTS: Smokers mean age was 45.5 years, 51.1 % were male. Participants were more likely to be married (63.5%), manual workers (59.5) and 52.5% had completed secondary education. Mean age of starting tobacco consumption was 17.2 years and the mean number of self-declared cigarettes smoked per day was 15.4. Half of the participants declared a low dependency on nicotine. 74.5% of participants declared previous attempts to quit smoking. Patients tended to live in a non-smoke-free environment; 84.4 % of the patients were users of ICTs. Web pages/Internet was the ICT most valued to help smokers in tobacco cessation, but overall confidence that ICTs

could help smokers to quit smoking is low.

CONCLUSION: The perception of the usefulness of ICTs to quit smoking by the participants is generally low and lower than expected, being higher in women, younger than 45 years old and users of each of the ITCs, being the most valued web pages / Internet.

Analysis of the smokers participants in a clinical trial based on the use of e-mail to stop smoking

Laura Díaz Gete¹, Jose Manuel Trujillo Gómez², Carlos Martín Cantera³, Carmen Castaño⁴, Ana María Gómez Quintero⁵, Jessica Sánchez Fondevila¹

¹Primary Healthcare Centre, La Sagrera, ICS, Barcelona, Spain

²Institut Universitari d'Investigació en Atenció Primària Jordi Gol (IDIAP Jordi Gol), Barcelona, Spain

³Primary Healthcare Centre, Passeig de Sant Joan, ICS, Barcelona, Spain

⁴Primary Healthcare Centre, La Alamedilla, SACYL, Salamanca, Spain

⁵Primary Healthcare Centre, Turo, ICS, Barcelona

Background and AIMS: Common interventions for smoking cessation are based on medical advice and pharmacological aid. Information and communication technologies may be helpful as interventions by themselves or as complementary tools to quit smoking. Our main aim is to know the profile of potentially participating smokers in smoking cessation interventions by email.

METHODS: We have made a comparison between participants in two studies realized in Catalonia, Salamanca and Aragón (Spain): A Descriptive observational study conducted in 84 health centres, which included by simple random sampling 859 primary healthcare smokers and a Randomized Controlled Multicentric Trial, which included 1060 smokers. Only were selected those smokers who had and checked regularly an E-mail account. Through personal interview health professionals collected Socio-demographic data and variables related with tobacco consumption through face to face interviews. Both Statistical analyses were conducted using SPSS, version 17.0 (SPSS Inc, Chicago, IL).

RESULTS: In total participated 1919 smokers. The mean age was 41.7 years (SD: 11.7), being mostly women (54.7%), married (63.2%) belonging to higher classes (70.4%), with an educational level in the TABATIC Trial lower than the Descriptive Study (77.9% vs 28.2%). Participants in the TABATIC Trial had a higher level of nicotine dependence, had previously made more attempts to quit smoking (3.1 vs 2.3) and had consumed more medication in them that Descriptive Study participants (44.1% vs 23.1%), being nicotine replacement therapy, gum and patches, most commonly used medication (15.7%). The environment of the participants was generally smoker.

CONCLUSION: Therefore, the profile of the potential participants in smoking interventions based on the e-mail are women, older, married, most favored social status, but with a lower level of education, greater nicotine dependence and a great number of previous attempts, which have consumed medications for quitting occasionally and whose environment was predominantly smoker.

Keywords: smoking cessation, information and communication technologies, primary health care, e-mail.

OP-223

Relation between a niche and postmenstrual spotting

Marjolein Dieleman¹, Judith Huirne², Hans Brölmann², Lucet Van Der Voet³

¹University Medical Center, Utrecht, The Netherlands

²VU University Medical Center, Amsterdam, The Netherlands

³Deventer Hospital, Deventer, The Netherlands

Background & Aim

A lot of women visit the general practitioner with menstrual problems. In women with a history of caesarean section (CS), the uterine scar may be the cause of menstrual problems. While the CS rate is increasing in most Western countries, the gynaecological side effects of this procedure are still poorly studied. Recently, some attention has been devoted to the presence of a niche at the site of a caesarean scar. A niche is defined as a triangular, anechoic area at the presumed site of incision. The main purpose of the SECURE-study (Scar Evaluation after Caesarean by Ultrasound REgistry) was to assess the prevalence and appearance of a niche, and to evaluate the relation with abnormal uterine bleeding.

Method

An observational prospective cohort study was performed between October 2007 and May 2009. All 225 women were consecutively included and examined with gel instillation sonohysterography (GIS) 6 to 12 months after CS to detect a niche. A questionnaire about the menstrual cycle was completed and women were asked to keep record of their bleeding pattern for a period of 2 cycles. As part of the follow up, the questionnaire will be repeated every year for the next 5 years.

Results

The presence of a niche could be demonstrated with GIS in 117 (56%) out of 209 women. In 16 women distension was insufficient for accurate assessment. The prevalence of postmenstrual spotting was 34% in the group of women with a niche compared to 15% in the group without a niche ($p=0.002$).

Conclusions

A niche can be seen in 56% of women with a caesarean scar. Postmenstrual spotting is significantly associated with the presence of a niche.

Keywords: niche, caesarean scar, postmenstrual spotting

OP-224

Satisfaction of patients attended in two different models of primary care in Spain and Portugal

Ricardo Enrique Reolid Martínez, María Flores Copete, Mónica López García, Pilar Alcantud Lozano, Milagros Azorín Ras, Francisco Escobar Rabadán, María Candelaria Ayuso Raya
Centro de Salud Zona IV. Sescam. Albacete. España

BACKGROUND & AIM:

Patient satisfaction can be important as a measure quality of care in acceptability terms to individual patients of different primary care organizational models.

The aim of the study is to know the degree of user satisfaction regarding the health care service in a Spanish health center(public, SESCAM) and another Portuguese(Unit of Functional Health).

METHOD:

Design: Cross-sectional study.

Setting: Primary Care.

Participants: 87 and 80 patients in Spain vs Portugal.

Main outcome measures: They were asked to respond the EUROPEP instrument,23-item validated and internationally standardized measure evaluations of general practice patients.

Other variables: age, sex, education level.

The collected data were coded and entered into a database using the SPSS 17.0 statistical programme. The analysis included a description of the variables, comparing both health center (Mann-Whitney U test).

RESULTS:

The mean age was 50.1 (SD:16.3) and 56,9 years (SD:17.0) in Spain vs Portugal ($p=0.011$); 56.3% and 61.2% were women, there were no statistically significant differences (NS) by sex. (84.3 and 73.7%) had primary or higher level (NS).

In general, Portuguese patients had more favourable opinion about the care they received. The most striking differences ($p<0,0001$) were found: telling them what they wanted to know about their illness (97,2 vs 81,7), helping to deal with emotional problems related to health status (94.5 vs 74.1);waiting time in the waiting room (74.7 vs 40,0).

With regard to questions assessing some professionalism aspects (confidentiality, helping to feel well, physical examination, knowing what he or she had done, preparing to expect from hospital care) and administrative ones (getting an appointment, getting through the practice or the doctor on phone) there were NS.

CONCLUSIONS:

Portuguese users of Unit Functional Health have shown a higher degree of satisfaction with the care provided compared with those who were attended in Spanish health center

Keywords: Patient Satisfaction; Models, Organizational; Primary Health Care.

OP-225

Cognitivate function assessment in relation with socio-demographic features and depression in geriatric patients: a community-based study

Ayşe Akay, Aysegul Uludag, Erkan Melih Sahin, Yusuf Haydar Ertekin, Murat Tekin, Selen Gungor, Zeynep Daglı, Semsettin Can Asar, Meryem Askın
Department of Family Medicine, Faculty of Medicine, Canakkale Onsekiz Mart University, Çanakkale, Turkey

AIM: to evaluate the socio-demografic features and depression relation with cognitive impairment in geriatric population.

METHOD:

The research was descriptive design. The population was established by 65 years and older people live in Kepez town of Çanakkale. In this region 1,200 geriatric people were living. These people were classified according to

gender and age and we aimed to reach 10% of whole geriatric population. The participants who lost sense of reality and declared not to submit the study were excluded.

A questionnaire including sociodemographic features was applied. Mini Mental Test (MMT), clock drawing test and geriatric depression scale-SF were also applied.

RESULTS:

Mean age was 72.8 ± 6.4 [65-91], total of 128 geriatric participants were included. Of 50.8% participants were female and 3.9% participants were evaluated at home visit.

Mini mental test mean score was 26.8 ± 3.9 [10-30]. Of 85.9% participants were normal, 9.4% mild cognitive impairment, 4.7% of had dementia. In clock drawing test 38.3% participants got score 4 and lesser, as having cognitive function impairment. MMT and clock drawing test were positively correlated (Kendal tau-b $r=0.363$; $p<0.05$).

There was no significant difference between mini mental test scores of male and females ($F=1.050$; $p=0.353$). In 85 years and older age group got significant low MMT scores than others ($F=9.951$; $p<0.05$). There was no significant association; retired and working individuals were significantly had higher MMT scores than unemployed ones. Significant higher MMT scores were associated with increased educational level and regular monthly income ($p>0.05$).

As the Geriatric depression test, 35.9% of participants were concordant with depression. MMT score and depression scale score were negatively related. (Pearson $r=-0.351$, $p<0.05$). Participants, depression risk, got significantly lower scores from clock drawing test and MMT ($t=4.065$; $p>0.05$ and $t=3.287$; $p<0.05$).

CONCLUSION: In the geriatrics; age, education level, working status and depression influence cognitive impairment.

Keywords: Geriatrics, cognitive function, socio-demographic function, depression, mini mental test

OP-226

The impact of vitamin D deficiency on cognitive functions in patients with type 2 diabetes mellitus

Cihan Fidan, Zehra Yeğın, Altuğ Kut

Departments of Family Medicine, Başkent University, Ankara, Turkey

AIM: Vitamin D insufficiency and deficiency is one of the major health problems in the world and in our country. Recently, vitamin D effects on diabetes and cognitive functions has been the subject to a lot of major research, but studies on this issue are still insufficient. Despite the studies made, still the effects on cognitive function of vitamin D deficiency in type 2 diabetic patients is not known exactly. This study aimed to investigate the impact of vitamin D deficiency on cognitive functions in patients with type 2 DM.

METHOD: 118 Type 2 DM patients with vitamin D deficiency were included as a subject group, and 118 Type 2 DM patients without vitamin D deficiency were included in the study as a control group. The cognitive functions of study groups were evaluated with Mini Mental Status Examination Test (MMSE). By this test, data were collected about the orientation, registration, attention, calculation, recall and language abilities of patients.

RESULTS: The mean age of the study subjects was 57.58 ± 7.14 years. 153 (64.8%) of the patients were female and 67 (35.2%) were male. One hundred and sixty-nine (71.6%) patients had diabetes for less than 10 years and 67 (28.4%) had diabetes for more than 10 years. Of these, 189 (80.1%) were using oral antidiabetic drugs, 17 (7.2%) were using insulin therapy, and 30 (12.7%) were using a combination therapy. Group 1 had a significantly lower vitamin D level than Group 2 ($17,19 \pm 6,52$ vs $39,89 \pm 11,85$; $p=0.00$, t-test). The total test score and subscore analyses based on the severity of vitamin D deficiency revealed no significant correlation between vitamin D deficiency and cognitive functions ($p>0.05$).

CONCLUSION: There was no significant correlation between vitamin D levels and cognitive functions of participants.

The necessity to thyroid ultrasound screening using TIRADS classification and Strain Elastography, in neighboring countries affected after Chernobyl radioactive disaster

Mihai Sorin Iacob¹, Mihai Ghiris², Sorina Saftescu², Madalina Gligor²

¹Department of Ultrasonography in Family Medicine, Timis Society of Family Medicine, Timisoara, Romania

²Department of Family Medicine, Advitam Medicis Medical Center, Timisoara, Romania.

BACKGROUND: Latest statistics, places Romania at a high level among EU countries in terms of morbidity and incidence of the thyroid diseases. In recent decades in Romania, after the nuclear accident at Chernobyl, especially in the Banat Mountains, where there are still incorrect disused uranium mines, we observe a clear increase over ten times of thyroid diseases predominantly because of multi nodular goiter and autoimmune thyroiditis. The prevalence of malignant thyroid nodules are growing, most being 80% papillary micro carcinomas. We tried to analyze this, using Power and Doppler Duplex ultrasound and then was made the Strain Elastography to identify tumors stiffness.

METHOD: We report a prospective thyroid ultrasound screening performed on 1169 adults with oncological risk factors, aged over 20 years, followed for two years, female gender sex ratio =3:1. As an initial diagnostic method, the Doppler Duplex ultrasound was the main investigation technique. We designed in our study an Ultrasound Scoring System for predicting thyroid malignancy. Each patient entered was stored into an electronic database in Microsoft Access, executed by us. For standardization and accuracy of reporting, we used TIRADS classifications by Russ and Strain Elastography scores by Rago et al.

RESULTS: Were found a total of 119 patients with diffuse diseases and 227 with benign and malignant thyroid nodules. The prevalence of thyroid diseases was 29.60%(95%CI:26.99%to 32.31%), with sensitivity 95.38%, specificity 94.78%, accuracy 94.95%, PPV 88.47%, NPV 97,99%, $p<0.01$. Then we did a comparative statistical analysis of our ultrasound methods used(ROC curve analysis, ANOVA $p<0.001$).

CONCLUSIONS: Ultrasonography proves to be a very efficient method with a high value in thyroid screening for the early detection of diffuse diseases and tumors of thyroid in asymptomatic stage with high prevalence, for diagnosis of vascular network in tumors and absence of elasticity in the nodule certifying malignancy.

Assessment of excessive alcohol consumption and unit for AUDIT test in primary care

Fernando Leiva Cepas, Esperanza María Romero Rodríguez, Adriana Cabello Chanfreut, José Cuevas Cruces, Joao Miguel Madeira Martins, Javier López Moreno, José Ángel Fernández García, Luis Ángel Pérula De Torres Teaching Unit of Family and Community Medicine of Córdoba, Andalusian Health Service, Junta de Andalucía, Spain

AIMS: To assess the prevalence of opportunistic manner of heavy drinking and alcohol dependence syndrome (ADS) in patients presenting to primary care centers (PCC). Evaluate effectiveness of temperance "brief advice".

Design: open, type "before-after" evaluation of the effectiveness of a preventive intervention quasi-experimental study

Location: Multicenter. Health Centers National Health System.

MATERIAL-METHODS: Health Centres held in the National Health System, including as participating doctors and nurses. For an alpha error of 5% and an accuracy of 3% and a rate of 50%, would be included in the study 1200 patients between 14-90 years of age, of both sexes. Will be invited to participate to all members of the Spanish Society of Family and Community Medicine (SEMFyC) and professionals from a random sample of health centers in the region. Once established their intention to participate, shall complete a logbook data collection (which also includes social morbidity data and an AUDIT questionnaire) to be offered to patients who met the inclusion criteria. Descriptive and inferential statistics (P <0.05 bivariate and multivariate analysis) will be made.

Applicability: through the results of this study are intended identifying patients having risk consumption to intervene from the standpoint of small tip if evaluating its effectiveness in alcohol detoxification by AP; likewise aims to involve the Health Administration to value the problems of alcohol consumption in a Mediterranean culture like ours.

Ethical and legal aspects: the protocol will be submitted to the Research Ethics Committee of Cordoba 1 September 2014. Participants informed consent and the processing of data will be requested in accordance with the Data Protection Act

Keywords: Excessive consumption of alcohol, AUDIT, brief Council.

A Cluster Randomized control trial to evaluate complementary feeding strategies through dietary diversification in infants in developing country

Aziz Abdul Rehman Jiwani¹, Zulfiqar Bhutta²

¹department of family medicine, aga khan university, karachi, pakistan

²department of paediatrics, aga khan university, karachi, pakistan

Back ground: Transition from exclusive breast feeding to the complementary feeding poses many challenges as the demand of nutrients for optimum growth and development increases steadily. The question; would the food based strategy through education be enough to provide a wide variety of micronutrients for the treatment of anemia and growth or addition of micronutrient is required?

METHOD: A prospective community-based randomized controlled efficacy trial in a representative urban population of Karachi was conducted. Infants and mothers were enrolled and placed in three groups - defined as Nutr Education (Nutr Edu), Oral iron supplementation (OIS) and Multiple micronutrient fortification (MMF). A cohort of 451 infants (177 in group Nutr Edu, 141 in group OIS and 133 in MMF) were followed for three months (till the end of treatments).

RESULTS: This trial demonstrated that MMF significantly improved the iron status. Mean Hemoglobin level improved significantly between the groups to 10.30 gm/dl (95% CI; 10.02, 10.58) in MMF vs. 9.87 gm/dl (95% CI; 9.61, 10.12) in the Nutr Edu at the end of trial. There was an overall improvement in rate of anemia with significant reduction in anemia [relative risk (RR) of 0.81 (95 % CI; 0.68, 0.97)] for MMF compared with nutrition education alone and RR of 0.84 (95 % CI; 0.71, 1.00) of OIS compared to Nutrition education alone. The improvement in weight gain over the period of trial was significant as the mean monthly weight gain increased by 300 gm in the group MMF as compared to 240 gm (P= 0.014) in the Nutr Edu group and the mean monthly WAZ scores improved significantly by 0.12 in MMF as compared to 0.04 in Nutr Edu group.

CONCLUSION: Along with iron other micronutrients may be needed to improve nutrient intake, iron absorption, and growth in infancy

Prevalence and antibiotic susceptibility pattern of urinary pathogens isolated in urine cultures from patients of a Primary Care Health Unit

José Carlos Da Silva Russo, Bruno António Covelo De Almeida, Ana Margarida Romão, Sara De Sousa Rocha
Unidade de Saúde Familiar Descobertas, Belém, Lisboa, Portugal

Background & AIM: Urinary tract infections (UTI) are one of the most common bacterial infections and its treatment is often started before the urine culture result. Knowing the local prevalence and antibacterial susceptibility pattern of the microbial agents helps choosing the empirical treatment of UTIs. This is particularly important in context of increasing antimicrobial resistance. This study aims to characterize the prevalence and antimicrobial susceptibility pattern of the urinary pathogens isolated in urine cultures performed in laboratories located in the area of influence of a Lisbon Primary Care Health Unit (USF Descobertas) requested by this unit's physicians.

MATERIAL-METHODS: The authors carried out a descriptive, cross-action and observational study. Sample: All positive urine cultures requested by USF Descobertas' physicians performed between 11.01.2009 and 10.31.2012 to all patients with 18 years of age and older.

RESULTS: The authors had access to the results of 213 positive urine cultures, 75.1% of which were from women, and 66.2% belonged to individual aged ≥ 65 years old. Nine different bacterial strains were identified, being *E. coli* the most frequent (77.5%) followed by *P. aeruginosa* (7.51%) and *Klebsiella* spp. (7.04%). Ampicillin was the antibiotic that showed higher resistance to *E. coli* (41.8%) followed by Trimethoprim/Sulfamethoxazole (27.0%). Norfloxacin and Ciprofloxacin showed resistance in 20.6% and 19.4% of *E. coli* strains, followed by Amoxicillin/Clavulanate (15.8%). *E. coli* resistance to Fosfomicin and Nitroforantoin was 1.2% and 3.0%.

CONCLUSIONS: The antimicrobial prevalence found in this study is similar to the ones described by other authors. Fosfomicin showed the best level of activity against *E. coli*, which makes it the best therapeutic option in empirical UTI treatment in these patients. Other option with low resistance is Nitroforantoin. The associations Trimethoprim/Sulfamethoxazole and Amoxicillin/Clavulanate, as well as quinolones, must be used with caution according to the resistances found in this study.

Keywords: Drug Resistance, Microbial; Urinary Tract Infections

OP-231

ACE Inhibitors or ARBS - Evidence on mortality in hypertensive diabetics?

Paula Mendes¹, Vítor Portela Cardoso²

¹USF Maxisaúde, ACES Cávado I, Braga, Portugal

²USF Gualtar, ACES Cávado I, Braga, Portugal

Background and AIM: Angiotensin converting enzyme (ACE) inhibitors and type II angiotensin receptor antagonists (ARA) have been used in hypertensive diabetics. However, the results of studies have been contradictory relative to the effect of cardiovascular preventing. Our aim was review the evidence on ACE inhibitors or ARA with regard to mortality or occurrence of major cardiovascular events in these patients.

METHOD: We conducted a research of meta-analyzes (MA), systematic reviews (SR), randomized clinical trials (RCT) and clinical practice guidelines (CPG) in the data sources National Guideline Clearinghouse, Guidelines Finder, Canadian Medical Association Practice Guidelines, Cochrane, DARE, Bandolier, Medline, DGS and RMP Index, published between 31/08/2009 and 31/08/2014 in Portuguese, Spanish, English and French languages. We used the MeSH terms: "Diabetes Mellitus" AND "Hypertension" AND "Angiotensin-Converting Enzyme Inhibitors" OR "Angiotensin Receptor Antagonists". The strength of recommendation taxonomy scale was used for the allocation of levels of evidence (NE) and strength of recommendation (SR).

RESULTS: Of 478 articles obtained, 13 met the inclusion criteria (5 MA and 8 CPG). A Cochrane MA showed that

ACE inhibitors significantly decreased mortality from all causes by 16% (NE 1) and Nakao's MA concluded that this class decreased the risk of myocardial infarction (NE 1). Recently, Cheng's MA found that ACE inhibitors significantly decreased mortality from all causes by 13%, cardiovascular mortality by 17%, myocardial infarction by 21% and heart failure by 19% (NE 1). ARA only decreased risk of heart failure. There was no consensus among the CGP, although most recommend ACE inhibitors or ARBs as first line.

CONCLUSIONS: The effects of ACE inhibitors or ARA appear to be different in mortality and cardiovascular events, although there are few head-to-head studies. The evidence found consistently favored the use of ACE inhibitors as first option in preventing morbidity and mortality in this population (SR A).

Increase in palliative sedation and reasons in cancer patients in Dutch general practice 2005-2014

Gé A Donker, Christel E Van Dijk

Sentinel Practices, NIVEL Primary Care Database, Utrecht, The Netherlands

Background

Little is known about the quantity and reasons for use of palliative sedation in cancer patients in general practice and the reason to apply palliative sedation when a request for euthanasia was pending.

Aim

To gain more insight into the reasons for palliative sedation at the end of life, also when a request for euthanasia was pending in cancer patients in Dutch general practice.

Design and setting

Dynamic cohort study using registrations and questionnaire data of Dutch GPs.

Method

Trends and reasons for use of palliative sedation in cancer patients were analysed using multilevel analyses in the years from 2005 until 2014 in the Sentinel Practices of NIVEL Primary Care database.

Results

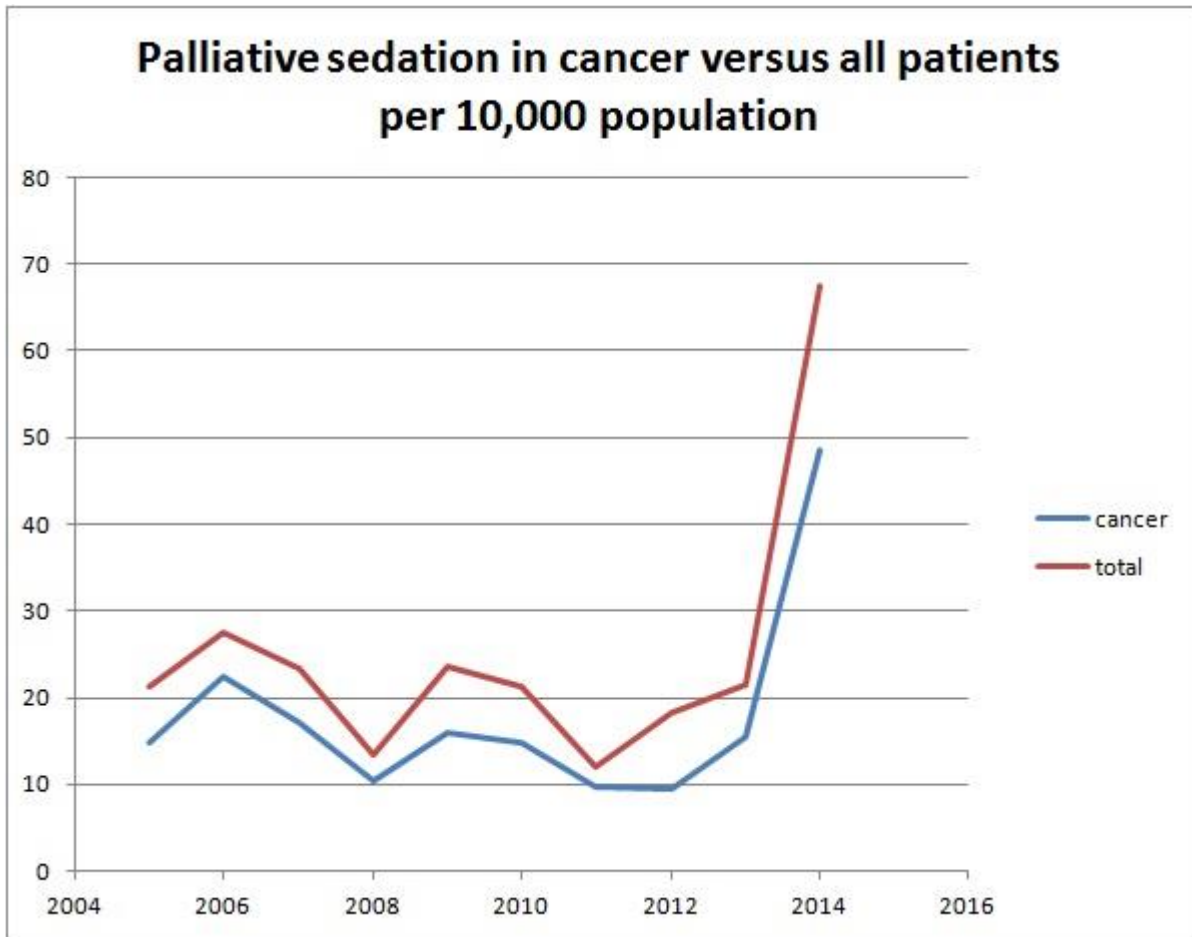

From 2005–2014, 220 cancer cases dying after palliative sedation were reported from 62 general practices. The incidence of palliative sedation increased in 2014 threefold compared to the nine years before ($P < 0.001$). Patient involvement in decision making before the start of palliative sedation (91%) was less frequently present in patients with delirium and in older patients (≥ 75 years, 87%) than in the group < 75 years of age (94%, $P < 0.05$). Pending euthanasia requests were present in 20% of cases; the choice for palliative sedation in these cases was: rapid progression of the disease and/or short life expectancy (55%), preference of patient and/or relatives (23%), adequate communication impossible (17%).

Conclusion

Palliative sedation showed a threefold increase in 2014 compared to the nine years before. There is no indication that palliative sedation is performed to avoid euthanasia.

Keywords: Palliative sedation, cancer, general practice, end of life, euthanasia

Palliative sedation in cancer versus all patients per 10,000 population

Depression Prevalence Among Elderly People Aged 65 Years And Above in Izmir

Ergun Akyol, Mehtap Kartal

Department of Family Medicine, Dokuz Eylul University, Izmir, Turkey

AIM: With the increase in senile people population, diseases that are specific to this population are becoming more important. Especially in senility depression among psychiatric diseases comes forward. In this research, it was aimed to determine the depression prevalence among elderly people aged 65 years and above, excluding dementia.

METHOD: This cross-sectional descriptive study was carried out by face to face interviews and by conducting surveys with 771 elderly people who are stratified according to their age. Patients who couldn't be able to cooperate due to consciousness changes, hearing and speaking loss are excluded from the study. Evaluation has been achieved with Geriatric Depression Scale Short Form, Daily Life Activities Scale, Mini Mental State. Statistical analysis has been defined with numbers and percentage. Chi square and T tests were used and $p < 0.05$ was considered significant.

RESULTS: In this study that we searched for the depression prevalence among 771 elderly people who aged 65 years and above. 134 patients who had dementia were excluded from the study, as dementia and depression has similar symptoms. Statistical data through 637 patients revealed depression prevalence as %15.2. For patients whose ages between 65-74 it is stated as %10.9; whereas it is % 20.3 for patients who are above 75. Increased age ($p=0.001$), being single ($p < 0.001$), living alone ($p < 0.001$), low education level ($p < 0.001$), presence of diabetes ($p=0.010$), osteoporosis ($p=0.002$) increased depression risk in the study population.

CONCLUSIONS: It is obvious age is an important risk factor for depression. However, there are also social and health issues that can be interpreted as risk for elderly depression. Primary care physicians have to be more attentive about these risk factors and be more companionable about effective treatment of depression in elderly population they care for.

OP-234

Variation in primary care requesting patterns for laboratory tests: physician, practice or patient factors? A cross sectional study

Sharon Louise Cadogan¹, John Patrick Browne¹, Colin Patrick Bradley², Mary Rose Cahill³

¹Department of Epidemiology and Public Health, University College Cork, Cork, Ireland.

²Department of General Practice, university College Cork, Cork, Ireland

³Department of Haematology, Cork University Hospital, Cork, Ireland

BACKGROUND: It has been estimated that 30% of patient encounters in Primary Care result in a laboratory test being requested. The volume of test requests rise annually by 3-6% despite a similar level of morbidity in the population. However, requesting patterns vary greatly between primary care physicians. The aim of this research is to identify the factors associated with higher requesting patterns.

METHODS: Cross-sectional analysis of routine laboratory data on serum immunoglobulin (Ig) test requests by 486 GPs in the South of Ireland. Data were extracted for 2013 using Cognos Impromptu software to interrogate the Health Service Executive's APEX laboratory system. Data extracted include physician level (gender, years of experience, college medical training obtained from, trainer GP status), practice level (urban/rural, practice type, size of practice) and patient level factors (gender, age, location). Using stata v12, multilevel Poisson regression analysis were performed to identify the factors associated with higher laboratory requesting patterns.

RESULTS: In 2013, over 18,000 Ig tests (IgA, IgG and IgM) for approximately 6,000 primary care patients in the South of Ireland. Primary care physician factors appear to have the strongest association with higher requesting patterns for tests. Male physicians' (OR: 1.3; 95%CI: 1.21-1.40), having a medical degree from a local university (OR: 1.53; 95%CI: 1.41-1.66), having a rural practice (OR: 1.45; 95%CI: 1.02-2.06) and the physician's years of experience (OR: 1.01; 95%CI: 1.005-1.01) were all positively associated with higher requesting patterns (p-value <0.05).

CONCLUSIONS: Physician level factors appear to have the greatest effect on laboratory requesting patterns. The design of future interventions aimed at optimizing laboratory use in Primary Care should consider these factors.

Shared clinical decision making: a Saudi Arabian perspective

Ali Alhaqwi

King Saud ben AbdulAziz University for Health Sciences, Riyadh, Saudi Arabia

OBJECTIVES: To determine preferences of patients regarding their involvement in the clinical decision making process and the related factors in Saudi Arabia.

METHOD: A cross-sectional study conducted in a major family practice center in Riyadh, Saudi Arabia, between March and May 2012. Multivariate multinomial regression models were fitted to identify factors associated with patients preferences.

RESULTS: The study included 236 participants. The most preferred decision-making style was "shared decision-making" 135/236(57%), followed by "paternalistic" 67/236(28%), and "informed consumerism" 34/236(14%). The preference for shared clinical decision making was significantly higher among male patients and those with higher level of education, whereas paternalism was significantly higher among older patients and those with chronic health conditions, and consumerism was significantly higher in younger patients (18-35 years old). In multivariate multinomial regression analysis, compared with the consumerism group, the shared group were more likely to be males [Adjusted odds ratio (AOR) = 2.71, 95% CI 1.23-5.97, p=0.014] and dyslipidemic (AOR = 2.92, 95% CI 1.03-8.25, p=0.04), and the paternalism group were more likely to be younger (AOR=13.14, 95% 1.03-9.54, p=0.04) and dyslipidemic (AOR=4.10, 95% CI 1.38-12.14, p=0.011).

CONCLUSION: Preferences of patients for involvement in the clinical decision-making varies considerably. In our setting, underlying factors that influence these preferences identified in this study should be considered and tailored individually to achieve optimal treatment outcomes.

Keywords: Clinical decision making, consultation, health education, patient centeredness

²SULEYMAN DEMİREL UNİVERSİTY / MEDICAL FACULTY / CARDIOLOGY DEPARTMENT

³BALCOVA HEALTH CENTER / IZMIR

BACKGROUND

Chronical diseases are long term diseases that are expected to last for three months or more. The number of children with chronical diseases has increased due to developments in medicine. As chronical diseases require long term treatments, it decreases the quality of life. People face many physiological and psychological changes especially in their childhood and teenage years. The purpose of this study is to determine if there are differences between children who have chronical diseases and who don't with their emotional states and their relationship with their environment.

METHOD

Children of ages between 4 and 11 who have applied to pediatrics polyclinics were included in our case-control study. Children who do not have any of the identified chronical diseases either with a complaint less than 10 days or no complaint were included in the control group. A questionnaire about demographic features and strengths and difficulties questionnaire applied to the parents (SDQ). The questionnaire results were analyzed with SPSS 15 program; also descriptive tests and hypothesis tests were applied.

RESULTS

125 children were included in case and 125 children were included in control groups; and there weren't any differences observed between the two groups regarding age, gender and the closeness with their caregivers. Regarding SDQ total score, and peer relations subgroup score, there were statistically significant difference between the groups ($p=0.034$ and $p=0.015$). There was no significant difference between the groups considering the impact on life.

CONCLUSION

In our study it was observed that children with chronical diseases had problems with their peer relations.

Health Promotion Behaviours and its correlation with Self-Efficacy Perceptions among Postgraduate Students'

Emine Küpeli, Sevgi Özcan, Nafiz Bozdemir

Department of Family Medicine, Çukurova University, Adana, Turkey

BACKGROUND and AIM: Self-Efficacy is a person's belief in his/her ability to complete a future task or solve a future problem. Bandura identifies four factors (Experience, Modelling, Social Persuasion, Physiological Factors) affecting self-efficacy.

The aim of this study is to evaluate postgraduate students' health promotion behaviours and its correlation with self-efficacy perceptions.

METHOD: The sample population was composed of 338 postgraduate students from institutes of science, social and health of Çukurova University. The data was collected by an anonymous questionnaire, Health Promotion Lifestyle Profile-II (HPLP) scale, and Self Efficacy scale.

RESULTS: Of the 51.5% postgraduate students were male. The mean age was 32.6 ± 5.2 years. The mean score of HPLP scale was at middle level (129.3 ± 18.3), the highest score was taken from spiritual growth subscale and the lowest one was taken from physical activity subscale. Significant relation was found in nutrition ($p=0.012$) and spiritual growth ($p=0.003$) between males and females. Participants indicated their parents (59.5 % mother and 24.9 % father) as role models for lifestyle behaviours. The mean score of Self Efficacy Scale was at middle level (57.6 ± 7.0), the highest score was taken effort subscale and the lowest one was taken from social self efficacy subscale. The 25-29 age group has low social self efficacy score compared to the other age groups ($p=0.001$).

Correlation analyses indicated that "willingness to initiate behaviour", "persistence in the face of adversity", "ability to deal with others effectively" subscales were significantly associated with health-promoting lifestyle. Correlation values were given in table 1.

CONCLUSIONS: Family physicians should be take into account the self efficacy during the healthy life behaviours counselling. Appropriate interventions to enhance perceived self efficacy will be increase the effectiveness of counselling. Also, the importance of parents as role models should be used to increase awareness and motivation.

²Department of Pediatrics, Faculty of Medicine, Bulent Ecevit University, Zonguldak, Turkey

INTRODUCTION AND AIM: Acute tonsillopharyngitis (AT) is one of the most frequently observed conditions encountered particularly by primary care physicians and pediatricians in outpatient setting. Inappropriate and excessive use of antibiotics increases treatment cost and risk for resistance development, and causes drug related side effects in patients. In this study, we aimed to determine frequency of GAS infection in cases with AT, sensitivity and specificity rates of rapid antigen test, and use of antibiotics.

MATERIAL-METHOD: Results of throat culture and rapid strep test (RST) in totally 693 patients who presented to pediatric outpatient clinics and pediatric emergency service in our hospital between September- December 2014 with symptoms and findings of AT were reviewed retrospectively. The study sample was divided into three groups as Group1 (0-3 years old), Group2 (4-15 years old) and Group3 (>15 years old).

RESULTS: Beta hemolytic GAS growth was detected in throat cultures of 18% (n=109) of 693 patients. There were statistically significant differences between age groups regarding growth in throat cultures ($p < 0.05$). According to comparison of the results of rapid antigen test with throat culture, sensitivity of rapid test was determined as

84%, specificity was 96%. Out of 109 patients with positive cultures, 97 (89%) were prescribed antibiotics, whereas 12 (11%) were not, HST results in 75% of these patients (n=9) were negative. Eighty of the 584 patients (13.6%) with negative culture results were prescribed antibiotics.

CONCLUSION: Rapid antigen test is valuable for the diagnosis and treatment of GAS in patients with AT owing to its high specificity. However, it is recommended to follow the result of throat culture in order to prevent inappropriate antibiotic use.

⁷Adnan Menderes University Department of Family Medicine, Aydın

BACKGROUND: Turkish primary care has undergone a drastic change starting in 2004 with a small city northern Turkey. The implementation of family medicine into primary care has been completed in 2010. Now, 21,175 family physicians (FPs) of whom 1,048 with post graduate training provides health care at 6,756 family health centers. Each FP has an average of 3,621 registered patients. Although almost five years have passed since the transition period has ended with the last city's incorporation to the system, little is known about the workday of a Turkish primary care doctor.

OBJECTIVES: The aim of the study is to determine the daily workload and to analyze the content of workload, to describe the service profile of FPs working in primary care in Turkey.

MATERIALS-METHODS: The study design is descriptive and cross-sectional. A total of 39 FPs from different provinces of Turkey volunteered to participate in the study. The date of 16th July which was Monday was chosen as the study day. Two surveys, one inquiring the demographic properties of FPs participated and a second encounter form with 43 items inquiring all aspects of FPs' workload were filled by the participants. 29 FPs responded and returned with survey forms. One report was excluded because lack of adherence to instructions. As a result 28 FPs from 17 different cities were enrolled into the study. The gathered information was used to form a database from where all descriptive statistical analyses were performed.

RESULTS: A total of 1,215 visits were reported. The average daily workload of FPs participating in our survey was 45.7 ± 16.8 visits. Mean age of the patients was 40 ± 25 years. Of these patients, 59.8% were female and 40.2% were male. 92.5% of all patients were family physicians' own registered patients while 7.5% of them were guests. A total of 1,610 RFEs were reported. We categorized them as prescription requests (451, 28%), clinical complaints (447, 27.8%), preventive medicine services (436, 27%), administrative reasons (161, 10%) and other reasons (115, 7.2%). Essential hypertension, dyspepsia and diseases of musculoskeletal system were the most common diagnoses in prescription requests. Sore throat, cough and pruritis were the top three clinical complaints. On 84 occasions (7%) FPs ordered a laboratory test for their patients. 16 patients (1.3%) had X-Ray imaging. 43 patients (4%) were referred to a hospital after clinical evaluation.

CONCLUSION: Our results suggest that FPs in Turkey are under severe pressure. Prescription requests account for an important percentage of this workload. Measures should be taken to lessen this burden. A nation-wide randomized morbidity and workload survey may elaborate more insight.

Urinary Incontinence In Women and The Effects on Overall Health, Psychosocial and Sexual Life

Kubra Can, Nilgun Ozcakar

Family Medicine Department, Dokuz Eylul University, Izmir, Turkey

Background & Aim

Urinary incontinence(UI) is defined as involuntary leakage of urine that leads to social and hygienic problems. UI is common among women; leads to sexual and social disadvantages besides being a medical problem which cause deterioration of quality of life. Our aim was to determine the frequency of urinary incontinence in women applying to primary care, to investigate the effects on overall health, psychosocial and sexual life and to draw attention to the reasons for not seeking medical help.

Method

In this descriptive cross-sectional study a questionnaire was used including socio-demographic characteristics, ICIQ-SF(Incontinence Questionnaire Short Form), FSFI(Female Sexual Function Index) and EORTC QLQ-C30(European Organization for Research and Treatment of Cancer Quality of Life Questionnaire)version 3.0. Past medical history, family history and obstetric-gynecological history is taken about UI and risk factors, habits, additional diseases were asked. SPSS 16.0 was used for descriptive statistics, chi-square, t-test and ANOVA. $p < 0.005$ was considered statistically significant.

Results

Mean age was 49.42 ± 15.64 (N:422). Frequency of UI was 36.0% and only 50.5% of UI subjects seek medical help. Mean score of ICIQ-SF was 12.20 ± 4.71 (min=4.00, max=20.00); 31.8% of participants reported that they had UI with cough or sneeze. Mean age of incontinent and continents were 60.85 ± 11.42 and 42.99 ± 13.93 . Frequency of UI increased by age($p=0,000$) and by the number of vaginal delivery(76.0% of women give birth 4 and more had UI)($p=0,000$). Also a statistically significant relationship was found between coughing and constipation with UI(respectively, $p=0,000$, $p=0,000$). EORTC QLQ-C30 general health scores were lower for UI ($p < 0.000$).

Conclusions

UI is common in women and major proportion of incontinent women considers this as a part of being woman and getting older, so they don't seek medical help. So family physicians should take care of the incontinent women more in primary care to increase health quality.

OBJECTIVE: Correct inhaler technique is central to effective delivery of asthma therapy. The study aim was to identify factors associated with serious inhaler technique errors and their prevalence among primary care patients with asthma using the Diskus dry powder inhaler (DPI), reportedly associated with the fewest errors of the DPIs.

METHODS: Historical cross-sectional study (2011–2013) using the iHARP database, which includes patient- and healthcare provider-reported questionnaires from 8 countries. Patients with asthma were observed for serious inhaler errors by trained healthcare providers as predefined by the iHARP steering committee. Multivariable logistic regression, stepwise reduced, was used to identify demographic and clinical factors associated with ≥ 1 serious errors.

RESULTS: Of 3681 patients with asthma, 623 (17%) were using a Diskus (mean [SD] age, 51 [14]; 61% women). A total of 341 (55%) patients made ≥ 1 serious errors. The most common errors were the failure to exhale before inhalation, insufficient breath-hold at the end of inhalation, and inhalation that was not forceful from the start. Factors significantly associated with ≥ 1 serious errors included asthma-related hospitalization the prior year (odds ratio [OR] 2.07; 95% confidence interval [CI], 1.26–3.40); obesity (OR 1.75; 1.17–2.63); poor asthma control the prior 4 weeks (OR 1.57; 1.04–2.36); female sex (OR 1.51; 1.08–2.10); and no inhaler technique review the prior year (OR 1.45; 1.04–2.02).

CONCLUSIONS: Poor inhaler technique is an ongoing problem. Patients with evidence of poor asthma control should be targeted for review of inhaler technique even when using a device thought to have a low error rate.

Frozen shoulder: treatment with corticosteroid injections without and with distension or wait and see, a randomized controlled trial

Satya Sharma, Anders Bærheim, Alice Kvåle

Institute of Global Health and Primary care, Section of General practice, University of Bergen, Norway

“Objective”: To find out whether treating adhesive shoulder capsulitis (frozen shoulder) by injections with corticosteroid and distension is more effective than treating with corticosteroids alone or treatment as usual in a primary care setting. “Design”: A prospective randomized intention to treat study. “Setting and subject”: All 105 recruited patients were randomized to one of three groups: Group 1 received intra-articular corticosteroid injection; group 2 received in addition sodium chloride as distension varying from 8 ml to 20 ml, while group 3 was control group. Thirty five patients in group 1 and 34 patients in group 2 received four injections each within the time frame of 8 weeks. All patients were assessed on the 1st visit, and at the 4th and 8th week with Shoulder Pain and Disability (SPADI), Numerical pain rating scale (NPRS) and range of motion (ROM). Postal assessment was repeated at 1 year for SPADI. “Results”: Out of the 216 patients referred for the study, 146 met the inclusion criteria, 40 patients declined to participate. There were no statistical significant differences between group 1 & 2 in SPADI, NPRS and ROM at baseline, at 4 weeks, 8 weeks or 12 months. There were statistically significant differences when comparing group 1 & 3 and group 2 & 3 at 4 and 8 weeks for SPADI ($p<0.01$; $p<0.001$), NPRS ($p<0.01$) and ROM ($p<0.01$ for lateral rotation), but not at 12 months. Comparison in outcomes between group 2 & 3 was slightly better than between group 1 & 3, but not clinically significant. “Conclusion”: Intervention by corticosteroid injection is better than “wait and see” policy in adhesive shoulder capsulitis in the short term. There was no statistical significant difference in outcome with intra-articular corticosteroid injection with distension compared to corticosteroid alone.

Evaluation of Screening and Risk Factors for Breast and Cervix Cancer in Rize, 2011

Özden GÖKDEMİR, Mehtap Kartal

Dokuz Eylül University, Medical Faculty, Family Medicine Department, İzmir, Turkey

BACKGROUND & AIM: Gynecological cancers are the biggest cause of mortality and the morbidity after breast cancer for women. Early diagnosis has an important role for women's health. The aim of is to evaluate results of the screening program for breast and cervix cancer and related risk factors.

METHOD: It's a descriptive study that is based on the database of Cancer Early Diagnosis, Screening and Education Center in Rize at 2011 when its second year of the population-based screening program. The screening results and the common risk factors of breast cancer and cervix cancer have been evaluated. The database includes socio-demographic characteristics (age, marital and education status), risk factors for breast cancer (smoking habits, oral contraceptive, hormone replacement therapy, family history of breast cancer, family history of other cancers, the age of menarche, the age of menopause and, number of labor, breast feeding), cervix cancer (the age of coitus).and results of screening for breast and cervix.

RESULTS: In 2011, 1249 women were screened either or both for breast and cervix cancer. Their mean age was 47.0 ± 9.9 (Range:26-73 years). Of the women 98.6% were married, 63.3% educated in primary-secondary school. The mean age of marriage was 19.5 ± 3.8 (Range:10-32 years) and mean age of menopause was 46.9 ± 6.1 (Range:21-60 years). Number of breast USG, mammography, and smear applied for screening were 1064, 978 and 1249, respectively and the results other than normal that needed to be followed up or referred to general surgery clinic and/or gynecology clinic were 144 (13.7%), 56 (6.7%), 11 (0.9%), respectively.

CONCLUSION: Although population-based screening program is ongoing its second year, there is a need for

facilitated accessibility and enhanced appropriate motivation with reliable information resources so that the program can work effectively, efficiently for promotion of healthy behavior.

Promoting Risk Factor for Pulmonary Tuberculosis Treatment in Manado City

Henry Palandeng¹, Joy Zeekeon², Margareth Sapulete¹, Gideon Tombokan³

¹Department of Community Medicine, Faculty of Medicine, Sam Ratulangi University

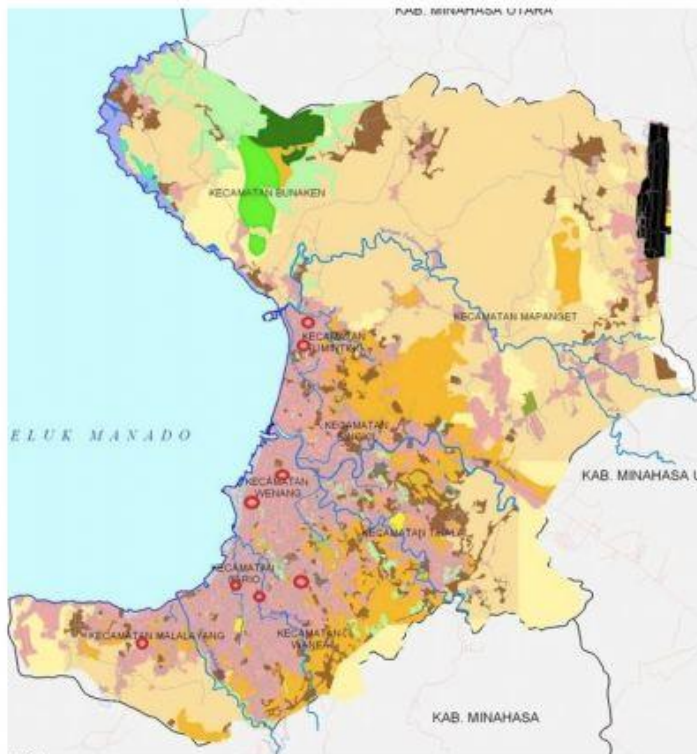

²Health Service Department of Manado City

³Medical Student at Faculty of Medicine, Sam Ratulangi University

Pulmonary tuberculosis (TB) is an airborne disease caused by *Mycobacterium tuberculosis*, which can infect healthy individuals who breathe in infected air. Although promoting risk factors for patients with Tuberculosis is something that health workers should do, there is a new problem during the diagnostic and therapeutic developments that is the Multi-drugs Resistant Tuberculosis (MDR-TB). MDR-TB is the biggest problem of the prevention and eradication of TB's. Data from MDR-TB Polyclinic RSUP Prof. Dr. R. D. Kandou in 2014 showed that there were eight pulmonary TB patients who developed MDR-TB. The purpose of this research is to know the overview of pulmonary TB patients' risk factors in developing MDR-TB in Manado in 2014. This research is a descriptive research. Both primary data from questionnaires and secondary data from MDR-TB Polyclinic were used as instruments for this research. The secondary data obtained during April-December 2014 showed that there were eight MDR-TB patients who live in four different districts in Manado City. This research shows about description of risk factors for patients with Multi Drug Resistant Tuberculosis in Manado City, it can be concluded that some elements in the MDR-TB prevention programs such as health education and supervision taking medication should be repaired because the priority is prevention rather than cure of patients. Also it can be concluded that evaluation need to be done in many aspects, but mainly focusing on the educative, informative, and communicative aspects of the health officers in giving the patients a healthcare. Patients must be given a clear understanding as well as motivation from the health officers to comply with the treatment regimen. Periodic evaluation of the pulmonary TB control and prevention of MDR-TB in the city of Manado for the success of the treatment in accordance with the ISTC (International Standards for Tuberculosis Care) is very important.

Validity and Reliability Test of Risk Assessment for Coronary Heart Disease in Indonesia Community Setting: Preliminary Study

Marita Fadhilah¹, Melia Fatrani Rufaidah¹, Irvan Fathurrohman¹, Riza Mawaddatar Rohmah¹, Raka Prazasta¹, Aliefa Asyifa¹, Muhammad Zulhafdy³, Witri Ardini², Fika Ekayanti¹, Risahmawati Tholib¹

¹Department of Community Medicine, Syarif Hidayatullah State Islamic University, Jakarta, Indonesia

²Department of Clinical Nutrition, Syarif Hidayatullah State Islamic University, Jakarta, Indonesia

³Department of Ophthalmology, Syarif Hidayatullah State Islamic University, Jakarta, Indonesia

Background and Aim

Recently, prevalence of coronary heart disease in middle low-income countries is increasing. Therefore, prevention of coronary heart disease is urgent and in Indonesia still there is no standard of risk assessment for coronary heart disease. This study aims to measure validity and reliability of risk assessment for coronary heart disease in Indonesia community setting.

Method

This study was a cross sectional study and conducted on April 2015 at Cinere district, Depok, West Java Province, Indonesia. We involved 30 respondents, over 30 years old consecutively. Respondents were asked to fill questionnaires and were examined blood pressure, total cholesterol and fasting blood glucose. We modified 8 items risk assessments of Framingham risk score and examined those tests. For statistical analysis we computed Spearman correlation to predict validity and Cronbach's alpha coefficient to measure reliability of this instrument.

Results

The predictive validity was lower for 3 items; test of diabetes, family history of coronary heart disease and patient history of HDL (Spearman correlations = 0.09; 0.03; and 0, respectively). For others of 5 items; age, test of fasting blood pressure, test of total cholesterol, smoking and gender (Spearman correlations = 0.79; 0.66; 0.35; 0.19 and 0.17), the predictive validity was moderate to good. In general Cronbach's alpha coefficients were moderate to good ($\alpha = 0.47-0.63$).

Conclusion

This study shows vary validity (from lower to good validity) and provides reliable risk assessment for coronary heart disease in Indonesia community setting.

Attitudes Of Medical Faculty Towards LGBT Individuals

İnan Arslantaş¹, Kemal Mustan¹, Neşe Yeniçeri², Dilek Güldal¹

¹Department of Family Medicine, Dokuz Eylul University, Izmir, Turkey

²Department of Family Medicine, Sitki Kocman Univeristy, Mugla, Turkey

INTRODUCTION:

Primary determinants of physicians' attitudes towards LGBT individuals (LGBTs) is the medical education and the attitudes of medical faculty (MF). We aimed to determine the attitudes and behaviours of MF.

METHODS:

A cross-sectional study was conducted among the MF of Izmir Dokuz Eylul University (DEU) and Mugla Sitki Kocman University (SKU). A questionnaire including demographic data, involment to LGBT health in medical education and health services was applied to participants besides Hudson-Ricketts Homophobia Scale (HRHS). Questionnaires were given to MF and collected later to avoid labeling. Our aim was to reach at least 50% response rate. All data analysis were performed using SPSS (version 15.0).

RESULTS:

144 volunteer MF with mean age of 47,30 (SD: \pm 6,81) were included; 82.6% of them were from DEU and 44.4% of them were women. 72.9% of them were from clinical departments and 30 of them from surgery; as 27.1% of them were from non-clinical departments. 73.6% of all MF didn't have previous education and 86.1% don't educate students on LGBT health. 80.6% of MF reported that LGBTs rarely or never consults them. 91.7% of MF believed that LGBT health issues were not discussed during medical education. 56.9%, 57.6% and 66% of MF believed that LGBT patients, students and MF were discriminated, respectively. MF mean HRHS total score was 82,69 (SD: \pm 27.73). MF place of employment ($p<0.001$), sex ($p=0.006$), department ($p=0.01$), previous education and educating students about LGBTs ($p=0.001$ and $p<0.001$, respectively), consulting frequency for LGBTs ($p=0.005$), believing that LGBT patients, students and MF are discriminated ($p=0.027$, $p=0.002$ and $p=0.025$, respectively) were significantly related to MF HRHS score.

CONCLUSION:

According to our study results, MF homophobia levels are found high and related with sex, department, education and seeing LGBT patients.

Homeless HepCheck: Screening for Hepatitis C (HCV) of the Homeless in Dublin Ireland

Carol Murphy¹, Anjali Patel², Gordana Avramovic², Austin O Carroll³, John Lambert³

¹Trinity Collage

²Mater misericordiae Hospital

³Universtiy collage Dublin

Background & AIMS: An estimated 160 million people are infected with HCV globally. In Ireland, 20,000-50,000 are HCV positive, with government statistics reporting 79% of infections from sharing contaminated injecting equipment. Many homeless people injecting drugs in Dublin attend the 'Safetynet' homeless services, a primary care network providing medical/nursing services. Historically HCV treatment was not offered unless they fulfilled strict criteria ie drug free with stable accommodation. We decided to offer opportunistic HCV screening to 1000 homeless through the Safetynet services in collaboration with the Mater Misericordiae University Hospital (MMUH); and track them through their linkage to secondary care.

METHODS: Recruitment is open to all attending Safetynet services. A blood test or oral swab for HCV is required. Patients are medically/socially assessed prior to hospital referral. Qualitative and quantitative data are collected on those HCV positive, and questionnaires conducted on 10% of those tested.

RESULTS: To date 127 people (82 male and 33 females) have enrolled; 27 previously screened as HCV positive, with 7 engaged in specialist care. Fifteen newly identified HCV + were referred to Infectious Disease Clinic, with 8 attending appointments.

Sixteen participants, aged 20-47 years completed the questionnaire. 56% reported poor to fair health, with issues including: HIV co-infection, dental problems and asthma. Eight reported engagement in GP practice. Reasons for non-engagement included 'illicit drug use' and 'not interested'. Eight (50%) respondents were homeless due to addiction issues 'drug taking'. Four (25%) of these reported 1st injecting drugs under the age of 18, with 11 (69%) injecting after the age of 21.

CONCLUSION: Preliminary data illustrates homeless people have poor states of health. Lack of stable accommodation impedes engagement with medical services. Despite indicating interest in treatment 50% failed to attend appointments. Active outreach and a creative approaches to providing appointments are needed.

Testing times ahead: a systematic review of interventions aimed at improving laboratory testing in primary care

Sharon Louise Cadogan¹, John Patirick Browne¹, Colin Patrick Bradley², Mary Rose Cahill³

¹Department of Epidemiology and Public Health, University College Cork, Cork, Ireland.

²Department of General Practice, University College Cork, Cork, Ireland

³Department of Haematology, Cork University Hostpital, Cork, Ireland

BACKGROUND: Laboratory testing is an integral part of day-to-day primary care practice underlying approximately 70% of diagnoses and treatment decisions. Research suggests that a large proportion of requests are avoidable. The aim of this systematic review was to comprehensively search the literature for studies evaluating the effectiveness of interventions for improving general practitioners (GPs) use of laboratory tests.

METHODS: PubMed, Cochrane Library, Embase and SCOPUS (from inception to 09/02/14, updated November 2014) were searched. Study designs considered included: systematic reviews, randomised controlled trials (RCTs), controlled clinical trials (CCTs), controlled before and after studies (CBAs) and interrupted time series analysis (ITSs). The population of interest were GPs. Interventions aimed to improve laboratory testing in General Practice were considered. The outcome of interest was volume of tests. Quality and risk of bias was assessed using a modified version of the EPOC Data Collection Checklist and Quality Criteria for studies with a control group (RCTs, CCTs and CBAs) and ITSs studies.

RESULTS: In total, 6,166 titles and abstracts were reviewed, followed by 87 full texts. Of these, 11 papers were eligible for inclusion in the systematic review (four RCTs, six CBAs and one ITS study). Interventions included education, feedback, guidelines, education with feedback, feedback with guidelines and changing order forms. Quality of studies varied with seven having a low risk of bias, three with unclear risk and one with high risk of bias. All but one study found significant reductions in volume of tests following the intervention, with effect sizes ranging from 1.2% to 60%. Due to heterogeneity, results could not be meta-analysed.

CONCLUSION: Feedback and education (including guidelines) based interventions proved most effective for changing GP requesting behaviour. However, the quality of some of the included study designs and the inclusion of various different tests between studies should be considered.

OP-249

The attitudes of the Health Management Students in Selcuk University about the law 4207

Esra Meltem Koç, Fatma Özlem Yılmaz, Musa Özata, Rabia Kahveci
General Directorate of Health Research, Minisy

OBJECTIVES: In Turkey, 23% of all death arises from tobacco-related illnesses. 'National Tobacco Control Program' had developed in Turkey by the Ministry of Health (MoH) in 2009 with amendment of Law 4207 in 2008. All closed places became smoke-free with the Law 4207. The National Media Campaign has been initiated with the slogans "Smoke Free Air-Zone" (SFAZ) for raising public awareness. The ratio of smoking consumption decreased from 33,4% to 27,1% between 2008 and 2010 with this campaign.

Health managers are one of the important milestones in that campaign for being an implementer and an example to the community. The aim of our study is to determine the tobacco related health knowledge, smoking patterns, attitudes, quit attempts/successes and the barriers to quitting smoking reported by current smokers of students at the Department of Health Management in a university in Turkey four years after the application of SFAZ.

METHODS: In this study we used a questionnaire with 33 questions, developed by researchers and Fagerstrom Nicotine Dependent Test to obtain the addiction level of the smokers. We applied these instruments to 244 students.

RESULTS: 38% of the students were male and 62% of them were female. 86 % of the students had never smoked, 3% were ex-smokers and 11 % were current smokers. 5,2% of females and 19,3% of males are smoking. 87,5 % of smokers think smoking habit is harmful. 12,5% of smokers say that they have never thought whether cigarette is harmful or not. 41,4% of the student agree that the law 4207 was generally adopted.

CONCLUSION: Only a few studies concerning the thoughts of health managers about the Law 4207 have been made after National Tobacco Control Program in our country. So, our research has an importance to highlight this subject and increase the awareness about the company.

Keywords: smoking, health management, attitudes, tobacco control program,

Evaluation of Care Burden, Anxiety and Depression Levels in Caregivers of Home Care Unit Patients

Dursun Çadirci¹, Gülayşe Tiyek², Erhan Yengil³

¹Department of Family Medicine, Harran University, Şanlıurfa, Turkey

²Department of Home Care Unit, Şanlıurfa Mehmet Akif İnan Training and Research Hospital, Şanlıurfa, Turkey

³Department of Family Medicine, Mustafa Kemal University, Hatay, Turkey

BACKGROUND & AIM:

Home care units are founded for care and follow-up of patients with chronic diseases. The number of people in need of care service has risen in our country, where the elderly population has gradually been increasing. Caregiving process is a difficult one for both the bedridden patients receiving care and caregivers who fulfils the patient's needs. Besides, caregiving leads to a significant burden for families.

The purpose of this study was to evaluate levels of anxiety, depression and care burden in caregivers of home-care patients.

METHOD:

A total of 86 caregivers in Sanliurfa Research Hospital Home-Care-Unit, participated in the study between February-March 2013. Sociodemographic Data Form, Zarit Caregiver Burden Scale(ZCBS), Beck Depression Inventory(BDI), Beck Anxiety Inventory(BAI) were applied.

Those who had BDI scores of 17 and over were considered to have depressive symptoms; those who had BAI scores of 8 and over were considered to have anxiety symptoms.

RESULTS:

Sociodemographic characteristics of the patients and caregivers were given in Table1. Distribution of the patients' diseases are presented in Figure1. Mean caring duration was 6.4 ± 6.4 years. The patients were cared by mostly their mothers(23.3%) and spouse(20.9%). The mean BDI of our study group was 9.9 ± 7.7 , BAI was 10.9 ± 8.0 , ZCBS was 57.9 ± 18.1 . Caring duration was correlated with BDI and ZCBS however there was no correlation with BAI. The age of caregiver was correlated to both BAI and BDI. ZCBS was positively correlated to BDI and BAI.

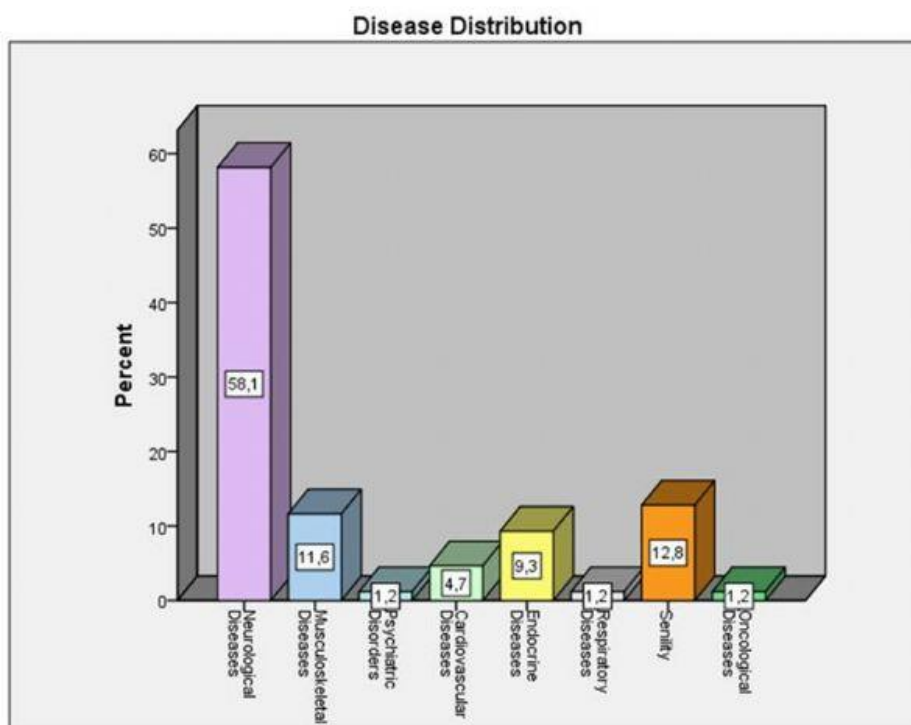

CONCLUSION:

In the present study, the burden level of the caregivers was found to be severe however the anxiety level was mild. The depression level was observed below the cut-off point. The burden level was significantly correlated to depression and anxiety levels.

None of the authors has any proprietary or financial interest in conception and design of this study.

Keywords: Caregiver burden, depression, anxiety, home care.

OP-251

The Effects of Preoperative Counseling Service on Anxiety

Elif Gürakar, Hadiye Küçükkaragöz, Azize Dilek Güldal

Department of Family Education and Counseling, Dokuz Eylül University, İzmir, Turkey

It is known that people who claim concerns before surgical intervention about the surgery, have hard time accommodating themselves, go through more psychological issues, feel anger and regret after the surgery and their perception of pain increase. The worries of the hospitals attendants also increase the worrying level of the patient. The objective of our study is to determine the effects of counseling and training given to patients and their attendants on preoperative anxiety level and postoperative pain level.

METHOD:

This randomized controlled trial was done with patients who were going to have lumbar spine surgery and their attendants. As data collecting tools; a) State Trait Anxiety Inventory, b) Patient Info Form, c) Hospital attendant's Info Form", d) "Postop Evaluation Form" were used. The people who had high state anxiety scores were excluded from the study. "Preoperative Anxiety Psycho-Training Program" was applied to experiment group. These tools were applied to both experiment and control groups both at admission and pre-operation; experiment group also received information about counseling and operation besides relaxation techniques. The data was evaluated using SPSS 15 program.

RESULTS: Mean trait anxiety scale scores of the control group on admission and preoperatively were 44.0 and 48.9 in order; and the scores of the experiment group were 46.3 and 42.0. There was significant difference in preoperative scores of control and experiment groups. between ($P=0.000$). A positive correlation was observed between the concern levels of the patients with their attendants both within control and experiment groups and these results were found out to be statistically significant ($p=0.001$). Post-operative pain levels of the experiment group were found out to be lower than control group ($P=0.000$).

CONCLUSION: Receiving preoperative counseling and training lowers the concern levels of the patients and their attendants as well as helping them to cope with post-operative pain.

Mortality by Cause According to Age Group Between Women in a Brazilian Metropolis

Ana Luísa Franco Moura, Gustavo Aguilar Alvarenga Amorim, Lara Louise Guimarães Silveira, David Carvalho Rezende, Wallace Pinheiro Rodrigues, Lorena De Almeida Ribeiro Prudente, Vinicius Bernardes Mendonça Damasceno, Natália Carasek Matos Cascudo, Camila Garcia De Souza, Ayssa Teles Abrão Trad
School of Medicine, Federal University of Goiás, Goiânia, Brasil.

Although Brazilian's population life expectancy has increased, cancer, chronic degenerative diseases and deaths due to external causes such as homicides and suicides have stood out among the leading causes of death.

This study aimed to identify the main causes of death according to age groups analyzed, establishing a relationship between the incidence of a particular disease and the age group most affected by it.

The method used consisted of the collection and interpretation of data obtained from 485 death certificates of women at childbearing age (10 to 49) living in Goiânia - GO, Brazil, in 2013. All data collected were obtained from DATASUS site using the descriptors "Death", "Women", "Reproductive Age" and "Age Group Second Chapter CID-10."

There have been 10 deaths of women between 10 and 14 years, of which 40% corresponded to external causes of morbidity and mortality. The records of 27 women between 15 and 19 pointed also to external causes, accounting for 48.1% of cases, and neoplasms and endocrine, nutritional and metabolic diseases, both with 11.1%. In 82 women aged 20 to 29 years, the causes of death that stood out were external causes, with 51.2%, and cancer, with 11%. In 126 women aged 30 to 39 years, there were 27% of cases of cancer, 19% of cardiovascular diseases, 19% of external causes and 8% of digestive diseases. Finally, the main causes of causes of

death that attacked the 240 women between 40 and 49 years were neoplasms, 31.7%, circulatory diseases, 24.2%, and external causes, 12.5%.

From the results obtained, it was possible to highlight cancer and deaths from external causes as the most important assumptions on mortality of women at childbearing age in the city of Goiania - GO.

Keywords: Women; age; mortality.

³Dokuz Eylul University Medical School Family Medicine Dept İzmir Turkey

INTRODUCTION

Physicians are willing to publish their work in prestigious journals, either because they want to climb career paths or they want to enlighten other people by sharing what they found. On the other hand academic career The implementation of research findings into practice has become increasingly recognised as a major priority for researchers, research funders and policymakers over the past decade [1-3]. It is known that there are disparities among researchers in publishing their work. Gender, career, country are claimed as the reasons of this disparity. Although peer review system is established against this problem, there is problem within the system. For example, some of the reviewers are much more stringent than others, leading to an unfair final decision, i.e., some submissions (i.e., papers or applications) with better quality are rejected. We aimed to picture the EJGP articles before and after indexing in SCI.

METHOD

Since EJGP indexed in SCI at 2009, we examined the journal between 2005-2014. All articles are investigated according to the first author's country, type of the article, topic and research method, authors affiliation with WONCA or journal reviewers and editors. All data before 2009 compared with after 2009. SPSS 15 is used for data analysis.

RESULTS

370 articles were examined in ten years. 39.7% was before SCI. 25.2% was from Netherlands, 13.3% UK, 6.0% Ireland, 5.4% Belgium, 5.4% Germany. The rest 44.7% was from 35 countries. 26 countries out of 40 were European countries. 47.8% of authors were affiliated with WONCA and related networks. 19.2 % of the articles had an author who was a practicing GP. 23.5% of articles had multinational authorship. The number of articles owned by the authors who have WONCA affiliation did not increase after the journal was indexed in SCI ($p>0.05$).

CONCLUSION

There are some problems on the distribution of the articles that are published in EJGP.

Keywords: EJGP, publication, bias

Use of antidepressants and age: a comparatively high risk of suicide attempts but not of suicide among the young

Hugo M Smeets¹, Fabian Termorshuizen¹, Marco P Boks², Eibert R Heerdink³

¹Julius Center for Health Sciences and Primary Care, University Medical Center Utrecht, Utrecht, The Netherlands

²Rudolf Magnus Institute for Neuroscience, Department of Psychiatry, University Medical Center Utrecht, Utrecht, The Netherlands

³Division of Pharmacoepidemiology & Clinical Pharmacology, Utrecht Institute of Pharmaceutical Sciences, Utrecht, The Netherlands

Objectives Since 2003, the United States Drug and Food Agency (FDA) issued a number of advisory warnings regarding a possible causal link between antidepressants (ADs), often prescribed by general practitioners and suicide behaviour, especially among young persons. We investigated the rates of (fatal) suicide attempts associated with ADs at different ages.

Methods By linking insurance claims registered in the Achmea Health Database and the death register of Statistics Netherlands (2001-2011), rates of (fatal) suicide attempts were estimated during episodes of AD use and intermittent episodes of no use over a broad age range.

Results For 232,561 patients with at least one AD prescription after >1 year of no use, 590 suicides and 2,939 suicide attempts were registered. During episodes of use compared to episodes of no use, the rates of suicide (8.5 vs. 3.1/10,000 pyrs.) and suicide attempts (68.8 vs. 28.1/10,000 pyrs.) were significantly higher. For suicide attempts, the Rate Ratio (RR) during AD use compared to no use decreased from 3.62 among those aged <24 years to 1.86 among those aged >60 years (P for interaction *age x episode*<0.001). A similar age dependency was observed when restricting use of ADs to SSRIs or to the later years (>5 years) after the first registered AD. For suicide, no statistically significant age dependency of the HR was established (P=0.9063).

Conclusions Episodes of AD are indicative of high suicide behaviour risk, especially at young age. At young age, use of ADs may be less effective for prevention of suicide behaviour, which necessitates intense clinical monitoring.

OP-255

Current and future use of point of care test (POCT) in the U.S. primary care physicians

Augustine Jungmoon Sohn, John Hickner, Fasika Alem

Department of Family Medicine, College of Medicine, University of Illinois at Chicago, Chicago, IL, U.S.A.

Background and AIM: Point of Care Test (POCT) has been used in the United States for several decades for diagnosing and monitoring acute and chronic conditions. Recently there has been an increased interest in POCT because of technological advances. There have also been suggestions that POCT could improve disease outcomes for certain chronic diseases. The aim of this study is to study the use of POCT and perceived benefits and concerns of POCT among U.S. primary care physicians.

METHOD: 405 U.S. primary care physicians were electronically surveyed about their use of POCT for diagnosing and monitoring illnesses and for reducing referrals for specialty care and hospital admissions. We asked about frequency of as well as benefits and concerns of using POCTs.

RESULTS: The top 10 conditions physicians reported using for diagnosis are diabetes, UTI, strep throat, influenza, pregnancy, anemia, infectious mononucleosis, anti-coagulation, acute cardiac condition and lipid disorders. The 10 most frequently used POCTs are: urine leukocytes or nitrite, urine pregnancy test, throat swab for Group A streptococci, fecal occult blood, blood glucose, nose/throat swab for influenza, hemoglobin, INR, HbA1c and white blood cell count. More than half of U.S. primary care physicians use or would use more than 15 kinds of POCTs at least weekly. The perceived benefits of POCT are immediately available result and physician and patient

satisfaction. Perceived concerns are accuracy of the tests and cost.

CONCLUSIONS: POCTs are commonly used by U.S. primary care physicians. Physicians believe POCT can improve quality of patient care with immediate diagnosis and monitoring and by decreasing referral for specialty care and hospital admission. With the technical improvement and decreased cost of POCT, they could be the game changer for improving primary care practice in the U.S.

Keywords: point of care test (POCT), primary care physician, United States

OP-256

The study of evaluation of patients' perception towards physicians with Heybet-Physician Related Health Care Perception Scale

Meryem Heybet¹, Oğuz Tekin², Rabia Kahveci¹, Adem Özkara³

¹Department of Family Medicine, Ankara Numune Trainin and Research Hospital, Ankara, Turkey

²Department of Family Medicine, Ankara Trainin and Research Hospital, Ankara, Turkey

³Department of Family Medicine, Hitit University Medical Faculty, Çorum, Turkey

BACKGROUND: In recent years the increase of violence against physicians has become a very important problem which is threatenning the peace of community. The purpose of this study is to evaluate the perception of patients to physicians and to determine the sociological and medical reasons which are forming the background of perception, with using the “Heybet – Physicians Related Health Care Perception Scale”.

METHODS: Our study was carried out with “Heybet – Physicians Related Health Care Perception Scale” in Ankara Numune Training and Research Hospital, Sıhhiye Local Polyclinic Family Medicine and Akyurt Polyclinic Family Medicine. 284 non-medical staff in the range of 18-65 years were included who accepted to participate the study. We measured sentences by 5 fold Likert scale. We analyzed data by factor and reliability methods in SPSS 13.00.

RESULTS: The effect of education on being knowledgeable about the medicine as a job factor was significant. Thoughts about violence against physicians have been found to be higher in rural areas. The patient – doctor relation factor is affected by thoughts about violence against physicians, comply to rules of hospital, trust and respect factors. This result was found to be statistically significant ($P<0,001$).

Thoughts about violence against physicians is affected by being knowledgeable about the medicine as a job, comply to rules of hospital, trust and respect factors. This result was found to be statistically significant ($P<0,001$).

CONCLUSIONS: It is observed that improving the skills of communication between the patient and physician, increasing the knowledge about medicine as a job reduce the thoughts about violence against physicians. Also improving the physical conditions of the healthcare institutions and the increased perception of trust in physicians decrease the thoughts about violence against physicians. To this end, policies should be produced and the community should be educated in communication.

Keywords: Phsyician persepction of patients, violence against physicians, patient-doctor relation

OP-257

Interprofessional cancer care: Who should get access to the personal electronic health record? An explorative study

Dominik Johannes Ose¹, Martina Kamradt¹, Eva Winkler², Joachim Szecsenyi¹, Ines Baudendistel¹

¹University Hospital Heidelberg, Department of General Practice and Health Services Research; Heidelberg, Germany

²National Center for Tumor disease (NCT), Ethics and Patient-Oriented Care; Heidelberg, Germany

BACKGROUND: A patient-controlled “personal electronic health record” (PEPA) is under development within our project. As a subset of PHRs, the web-based PEPA would enable patients to access, maintain and manage (including access management) a secure copy of their PHI integrated from various HCPs’ primary systems. Within the PEPA concept, patients are understood as active partners who manage their PHI across settings as one prerequisite for a more active role in their health care. The aim of our study was to explore perspectives of patients and HCP’s in terms of access management to a web-based PEPA.

METHODS: Overall 10 semi-structured focus groups were performed collecting views of 3 prospective user groups: patients with colorectal cancer (n=12) and representatives from patient support groups (n=2), physicians (n=17), and non-medical HCPs (n=16). Data were audiotaped, transcribed verbatim and thematically analysed.

RESULTS: Patients overall like to share their personal health information with others. Give general record access especially to GPs or in case of an emergency were discussed issues. Share their patient-controlled record with family members like spouses or trusted persons was central to patients, e.g. in instable phases of chronic illness or in case of an emergency. However, the opportunity to withdraw access was wished. Physicians from different health care settings wished to have full access to all information included in order to make appropriate treatment decisions.

DISCUSSION: Patients are willing to share their personal health information with HCPs and others like family members. Managing the access to a PEPA and its data gives patients the chance to take on an active part in their health care. A PEPA could facilitate information exchange among health care process participants and could enhance continuity of care. Giving access to family members could become relevant for instable situations in chronic conditions or in case of an emergency.

evaluation of community empowerment program through competition among four non communicable disease early detection activities in east jakarta, indonesia

Dewi Friska¹, Aria Kekalih²

¹family medicine division, community medicine department, universitas indonesia

²epidemiology and biostatistic division, community medicine department, universitas indonesia

Background

Community Medicine Department Faculty of Medicine, Universitas Indonesia managed family medicine clinic which held community empowerment program named Family and Community-based of Diabetes Managed Care Program. One of the activities is Early Detection for Non Communicable Disease called Posbindu. This program starts from October 2012 regularly every month in 4 subdistricts areas (Kayu Putih, Cipinang, Rawamangun, Pisangan Timur) located in East Jakarta Indonesia. Since this Posbindu activities mainly run by the cadres and supervised by the staffs of Kayu Putih Family Medicine Clinic for a year, evaluation by having competition for better activities is needed

Aim

To evaluate Posbindu activity conducted by the community using competition method and to explore how the cadre appreciate this method

Method

The evaluation was done in September – November 2013 in Kayu Putih, Cipinang, Rawamangun, Pisangan Timur subdistricts. The evaluation criteria consist of the number of cadres attendance, number of people participated in early detection activities, concordance between activities and standard of procedure, reporting and administration also innovation idea for continuity of activity. The score was given by the clinic staffs for three months in a row. Besides that, the score comes from the education games. We conducted focus group discussion and interview cadres to explore their perspective and appreciation related to this competition

Results

The highest scores were in innovation idea for continuity of Posbindu meanwhile the lowest score were in number of people participated in early detection activities criteria which indicated things needed for further improvement. Cadres admitted that they are very enthusiastic about this appreciation, evaluation and competition program, especially for the feedback they received for further improvement and continuity of the activity.

Conclusion

Evaluation and competition for community empowerment program is needed as appreciation for the activities and making future plan for better improvement and continuity of the program

Keywords: appreciation, evaluation, community empowerment program, early detection, non communicable disease

OP-259

A Qualitative Study on Factors Influencing The Retention Rate of Methadone Maintenance Therapy (MMT) Among Clients In Tampin Malaysia

Faezah Hassan¹, Adibah Hanim Ismail¹, Irmis Zarina Ismail¹, Siew Mooi Ching¹, Norsiah Ali²

¹Department of Family Medicine, Faculty of Medicine and Health Sciences, Universiti Putra Malaysia (UPM) Serdang, Selangor Malaysia

²Tampin Health Clinic, Tampin District, Negeri Sembilan, Malaysia

BACKGROUND:

In 2005, Malaysia had adopted harm reduction approaches in the fight against HIV. Methadone Maintenance Therapy (MMT) is one of its measures which was first started in Tampin Health Clinic in November 2006. This clinic has been recognized by the World Health Organization as Asian model of best practice and Malaysian' best training centre for harm reduction.

One of the major challenges faced by all MMT centres is to retain illicit drug dependency clients in the program. Unfortunately, local literature on why clients remain in MMT is minimal despite it had been shown that MMT is beneficial.

Aim

To explore the factors that contribute to high retention rate in clients undergoing MMT in Tampin district.

METHODS:

Prospective qualitative study using focus group discussions (FGDs) and semi-structured in-depth interviews (IDIs). All sessions were audio-recorded digitally, transcribed in full and analyzed to look for emerging themes. Eighty four clients on MMT in Tampin District during the study period participated in this study.

RESULTS:

Few main categories of factors were identified. This includes personal, organizational, methadone impact and other factors. For personal factors, the clients described their awareness, spirituality, perceived changes in life, and fear had influence them to stay. The venue of MMT, staff' skill and attitude, numbers of clients, efficient system and other programs offered by the centre were mentioned as the organizational factors. The positive

effect of methadone on clients such as improved self confidence, appearance, physical, mental, family relationship, socio-economic status and acceptance by community also play a role. Low cost, easy accessibility and good support are among other factors mentioned.

CONCLUSION:

This study revealed several factors that influence the retention rate of MMT among the clients in Tampin which can be used to aid other Malaysian MMT centres to improve their clients' retention rate.

Keywords: methadone, retention rate, factors, Malaysia

OP-260

Do Primary Care Physicians Use Biopsychosocial Approach During Patient Interviews

Gökhan Şen¹, Tolga Günvar², Dilek Güldal²

¹Yenipazar Family Health Center, 5th Family Health Unit, Yenipazar, Aydin, Turkey

²Department of Family Medicine, Dokuz Eylul University Faculty of Medicine, Izmir, Turkey

OBJECTIVE: Biopsychosocial (BPS) model argues that the state of individual's health is in an interaction with the complex composition of the biological, psychological and social processes. Although, this model is the basic point of view of the family physicians, there is no sufficient data regarding with its reflection to daily clinical practice. One of the major reasons for this is the lack of enough, clear and objective criteria which are widely known and used to measure BPS performance of physicians. The aim of this study is to determine BPS performances of family physicians

METHOD: 40 Family physicians working in primary health care in Izmir participated in the study. Each participant made two consultations consecutively with two simulated patients who previously trained on two scenarios. Audiovisual recordings of these consultations were evaluated by three researchers by using a scale developed by Margalit and colleagues. The participants also evaluated their own performances with the same scale.

RESULTS: 80 patient-physician interviews were evaluated. While the physician participated in the study evaluated their own performance as biopsychosocial; the researchers evaluated the same performance as biomedical ($p < 0.05$). Participants showed mostly a paternalistic approach. There were no differences between two scenarios in terms of participants' and researchers' assessments of biopsychosocial performance. Consultations with longer total durations are more likely to be patient centered ($p < 0.05$).

CONCLUSION: The primary care physicians do not adopt a biopsychosocial approach in their practices. The reason for this may be the lack of education. To increase awareness on this issue; the processing of the issue satisfactorily in the medical school curriculum and, researches and studies on this topic in the future will shed light to physicians' perspective.

Keywords: The biopsychosocial approach, the patient-centered clinical method, the family physician.

Determination of Olfactory Level in Eskişehir

Burcu Kökoku¹, Cemal Cingi², Uğur Bilge¹, İlhami Ünlüoğlu¹

¹Department of Family Medicine, Eskişehir Osmangazi University Medical Faculty, Eskişehir, Turkey

²Department of Otorhinolaryngology, Eskişehir Osmangazi University Medical Faculty, Eskişehir, Turkey

BACKGROUND: In our country population-based studies for olfactory dysfunction are lacking. The aim of this study is to evaluate the prevalence of subjective olfactory dysfunction and its risk factors in Eskişehir general population.

Design: Prospective descriptive study

METHODS: The Sniffin' Stick odor test was applied to 478 volunteers who were selected from among the patients and the relatives admitted health centers for any reason in Eskişehir.

RESULTS: We found that the mean the odor identification (OI) scores was 8.23 ± 2.37 in Eskişehir. There was no significant differences between males and females; and smoking status (smoking and not-smoking) according to odor identification scores ($p < 0.05$). Steroid usage also affected odor identification scores negatively. Accurate detection percentage was %85.1 for No:5 pen; and it was "banana". Accurate detection percentage was %82.6 for No:12 pen; and it was "fish". Although the garlic is a spice; and it is often used in society, knowing ratio for the garlic was found too low. Accurate detection percentage for the garlic was detected as %7,1. This situation may be considered as the odor contained in the pen and the odor of garlic which is well known in Turkish society was not similar enough.

CONCLUSIONS: In older subjects, odor values decreased. Steroid usage also makes the odor identification scores to be decreased. Related to this finding, topical nasal steroids should be used when indicated absolutely. Perhaps, there is the need of revision for the garlic odor in the test Battery applied to Turkish People.

Keywords: "Sniffin' Sticks", odor, people, topical nasal steroid usage

Rural practice and chronic morbidity, problems encountered and solutions. EURIPA investigation study

Jean Baptiste Kern¹, Donata Kurpas², Aymeric Henriot¹, Candan Kendir³, Dominik Marciniak⁴, Jane Randall Smith⁵, Jean Pierre Jacquet¹

¹Department of general practice, Joseph Fourier University, Grenoble, France

²Family Medicine Department Wroclaw Medical University, Poland

³Dokuz Eylul University Faculty of Medicine, Department of Family Medicine Izmir, Turkey

⁴Department of Pharmaceutical Technology, Faculty of Pharmacy, Wroclaw Medical University, Poland

⁵EURIPA, Powys, Wales, UK

OBJECTIVES The purpose of these survey was to find out problems encountered by European practitioners in rural and remote areas within their primary practice connected with care for chronic morbidity patients. Also, our purpose was to collect their opinions, and solutions already implemented or suggestions.

METHODOLOGY We did perform qualitative descriptive study with prospective data collection from 2nd February to 20th March 2015 by a web questionnaire (based on bibliographic data), with additive results coming from a workshop in April 2015 WONCA Rural meeting. The survey population consists of European rural general practitioners (GP) approached by EURIPA "chronic morbidity" working group.

RESULTS We collected 163 answers from 25 nationalities; the age of respondents was: 27-76 years old (med 47.5). The study group consisted of: 47% female respondents (IC95 39-54) and 53% male (IC95 45-60). The average age of women was approximately 45 years and men approximately 51. Pathologies most frequently encountered were diabetes 82% (IC95 76-87), cardiovascular diseases 81% (IC95 74-86) and rheumatism 71% (IC95 64-78). Main issues reported as problems were: –Patients and family non-compliance, issue of education, and reiterative consultations for unfounded claims. –Diseases and polyopathy owing to problems of screening, a high

prevalence, and the association of several pathologies with dependence and disability. –Practitioners and care pathway with mainly a lack of time for GPs, and a sensation of poor recognition of the practitioner involvement. – Health system and organization because of bureaucracy, poverty / problem of costs and the access to rehabilitation programs. –Practical difficulties linked with polymedication, stock shortages and problems of distance.

CONCLUSION To improve the practice of the European GPs in rural areas about chronic morbidities patients, practitioners must be aware of the difficulties about these main issues. It will allow to build a position paper that will be presented to health authorities and professionals.

"Radiological requests in primary care, use or abuse?"

Juana Jimenez Martinez¹, Ana Cristina Menéndez López², Lázaro De Castro Peral³, Fátima Ghandour Fabre¹, Encarnación Madrid Sánchez¹

¹Torre Pacheco EAST Health Center (VIII AREA, Murciano Health Service)

²San Javier Health Center (VIII Area, Murciano Health Service)

³San Pedro Health Center (VIII Area, Murciano Health Service)

Introduction

Although scans that use ionizing radiation a health risk, demand continues to rise. Being the most used simple radiography, representing approximately 89% of irradiation received

Objectives

1. Study radiological outcome determines whether a change in the therapeutic attitude.
2. Radiological analysis of the percentage of requests that meet the recommended indications.
3. Knowing what type of requests for plain radiography are the most frequent in our basic health area.
4. Knowing if a factor is that the medical examination applicant is the owner or a substitute.

Material and Methods

- Design descriptive, transversal, observational.
 - Subjects: over 14 years, six doctors quotas our district health.
 - Data Sources: History-OMI-AP, Selene software, referral sheet.
- Simple random sampling. Sample size 203 patients (IC 95%, 5% accuracy, 50% expected prevalence)

Exclusion criteria: not reside regularly 6 months prior to testing.

Inclusion criteria: Be over 14 years, having been indicated radiological examination during 2014.

- Qualitative variables: gender (male / female), center of origin (header / peripheral), reason for request (diagnostic / control), type of radiological examination requested (radiography, ultrasound, CT, MRI, mammography), urgent / routine, anatomic location (head, chest, extremities, spine), change in the therapeutic approach, requesting physician (holder / substitute) indicated.

Quantitative variable: age.

Data analysis: bivariate analysis, Chi square test (qualitative) and Student's t test and ANOVA (quantitative).

- Limitations: incomplete clinical history.

Conclusions

Requests for plain films are the most frequent (89.7%), chest and spine.

The therapeutic attitude changes in 29% of cases, 67% of requests being indicated.

83% of requests are made for diagnostic purposes.

46% to over 50 years, 20-30% unnecessary requests.

Doctors working in central header make more requests (40%).

Keywords: Radiology, Primary Care, Irradiation

Do gifts from patients affect the doctor–patient relationship?

Ayca Karatas¹, Adem Özkara², Irfan Şencan¹, Ismail Kasım¹, Rabia Kahveci¹

¹Department of Family Physician, Ankara Numune Research and Teaching Hospital

²Department of Family Physician, Hitit University Çorum, Faculty of Medicine

BACKGROUND&AIM:

Some patients want to show their pleasure by giving gifts to their physicians and some of them want to provide privileges on doctor – patient relationship. The subject of receiving gifts is still controversial and there is not a certain rule. The aim of our study is to determine the attitudes of physicians about receiving gifts from patients and its impact on doctor–patient relationship.

METHOD:

We conducted a pilot study in a research and teaching hospital in Ankara. A 16 item semistructured questionnaire was administered to 60 physicians from surgical and internal departments. The essential topic was doctors' opinions about gifts coming from patients and their impact on doctor-patient relationship.

RESULTS:

60,3% of participants are female and 39,7% male. Giving gifts could affect the pre-treatment decision opion rate was 51,7%. They denied accepting gifts with monetary value. 66,6% of academicians and 36,5% of resident doctors expressed that they could accept reasonable gifts. 37,5% of specialists expressed that they could accept gifts for not to upset their patients. 11% of academicians, 25% of specialists, 12% of resident doctors expressed that they would never accept any gifts come from patients. 33% of academicians; 75% of specialists; 51,2% resident doctors expressed that their pre-treatment decisions colud be affected by the gifts.

CONCLUSION:

Yes, Gifts can affect doctors' opinions about patients and have impact on doctor–patient relationship. Most specialist and academician physicians feel receiving gifts are influential on decision making in patient encounter.

Keywords: Receiving gifts, doctor–patient relationship

Reflection Of Malpractice And Recessive Medical Applications To Today's Doctors

Gokhan Demirkiran¹, Dua Sümeyra Demirkıran², Erhan Yengil¹, Pınar Döner¹, Cahit Özer¹

¹family medicine, Mustafa Kemal University, Hatay, Turkey

²forensic medicine, Mustafa Kemal University, Hatay, Turkey

INTRODUCTION:

In Retrospective studies, It is understood that medical malpractice lawsuits were gradually increased in our country. There is no specific law that establishes the legal responsibilities of physicians in the our Punishment and indemnity national law when problems occurs due to physician's malpractice.

Although, America and Some European Countries laws contains malpractice in national law and applies them, It is emphasized that the biggest problem is defensive medicine in this coutries in scientific articles.

Defensive medicine can be defined as shortly“ using diagnostic and therapeutic medical applications unnecessary and avoidance of high risk application which result as malpractice lawsuits to avoid the doctor's litigation and not to pay compensation.”

This study was conducted due to the lack of studies about medical malpractice and recessive medicine in our country. We aimed to investigate the impact of malpractice on physician and how it is reflected with recessive medicine.

METHODS

Questionnaire study is planned, the most common method used in this field, to investigate the recessive medical practice of physicians

Sociodemographic questionnaire form which include age, gender, professional year and branches, was prepared questions which mentioned in the literature and used in the former studies, prepared in the form of questionnaire and applied to physicians to measure and evaluate defensive medicine practices of Specialists and general practitioners.

Family physicians work in Antakya and Serinyol family centers and all physicians working in Mustafa Kemal University hospital were selected for the study. Physicians was planned to be reached between January-May 2015. Ethical approval was taken from the Mustafa Kemal University hospital.

Data will be evaluated using the SPSS program

RESULTS AND CONCLUSION

The assessment will be made with the Questionnaire results.

Keywords: Malpractice, Recessive medicine, primary care

OP-266

From advance euthanasia directive to euthanasia; a consistent wish?

Eva Elizabeth Bolt, Roeline Pasma, Dorly Deeg, Bregje Onwuteaka Philipsen

Department of Public and Occupational Health, VUmc Expertise Center for Palliative Care, VU University Medical Center

Background.

The most common advance directive in the Netherlands is the advance euthanasia directive (AED), in which people describe the situation in which they would want euthanasia. It can be questioned whether these AEDs remain valid over years because people might change their minds on euthanasia when they become ill and approach death. This study aims to 1) describe whether people with an AED are consistent in their preference for euthanasia, and 2) what factors influence whether people with a preference for euthanasia request for euthanasia.

Method.

Retrospective cross-sectional study of deceased members of two cohort studies: the Longitudinal Aging Study Amsterdam (LASA), representative for the Dutch older population (6% having an AED) and the Advance Directive Cohort (ADC) consisting of people with an advance directive (82% also having an AED). Their proxies received a questionnaire after death of the cohort members (LASA n=167; ADC n=159).

Results.

Of the 159 older people with an AED almost all discussed their wishes with their family physician at the time of writing. At three months before death, 85% remained consistent in their wish for euthanasia and 3% changed their mind; 42% requested their physician for euthanasia (compared to 5% of people without an AED); 15% died after euthanasia. In multiple regression analysis, being aware of the approaching death, having worries at the end of life and cause of death (frailty) were associated with a preference growing into a euthanasia request.

Conclusions.

People with an AED are consistent in their preference for euthanasia. This finding demonstrates the validity of AEDs as representation of the patient's preference. However, less than half of people with an AED request for euthanasia. Apparently, other factors influence whether a preference for euthanasia becomes relevant.

Keywords: euthanasia, advance directives, advance care planning

OP-267

Appropriate care in the last phase of life; an explorative study among patients and relatives

Eva Elizabeth Bolt, Roeline Pasman, Dick Willems, Bregje Onwuteaka Philipsen

Department of Public and Occupational Health, VUmc Expertise Center for Palliative Care, VU University Medical Center

Objective

Many people are in need of care in the last phase of life. However, the care they receive is not always appropriate. For instance, people can receive overly aggressive treatment or can have limited access to palliative care. The term appropriate care is often used by policy makers, but it is unclear what care recipients consider appropriate care. This study aims to identify what care is perceived as appropriate and as inappropriate in the last phase of life, for different conditions, from the perspective of patients and relatives.

Methods

An online survey with open questions. Participants were recruited through organizations for patients, older people and medical professionals. Answers were analysed after data-driven coding. Forty-five patients and 547 relatives described the care they received and described why this care was appropriate or inappropriate.

Results

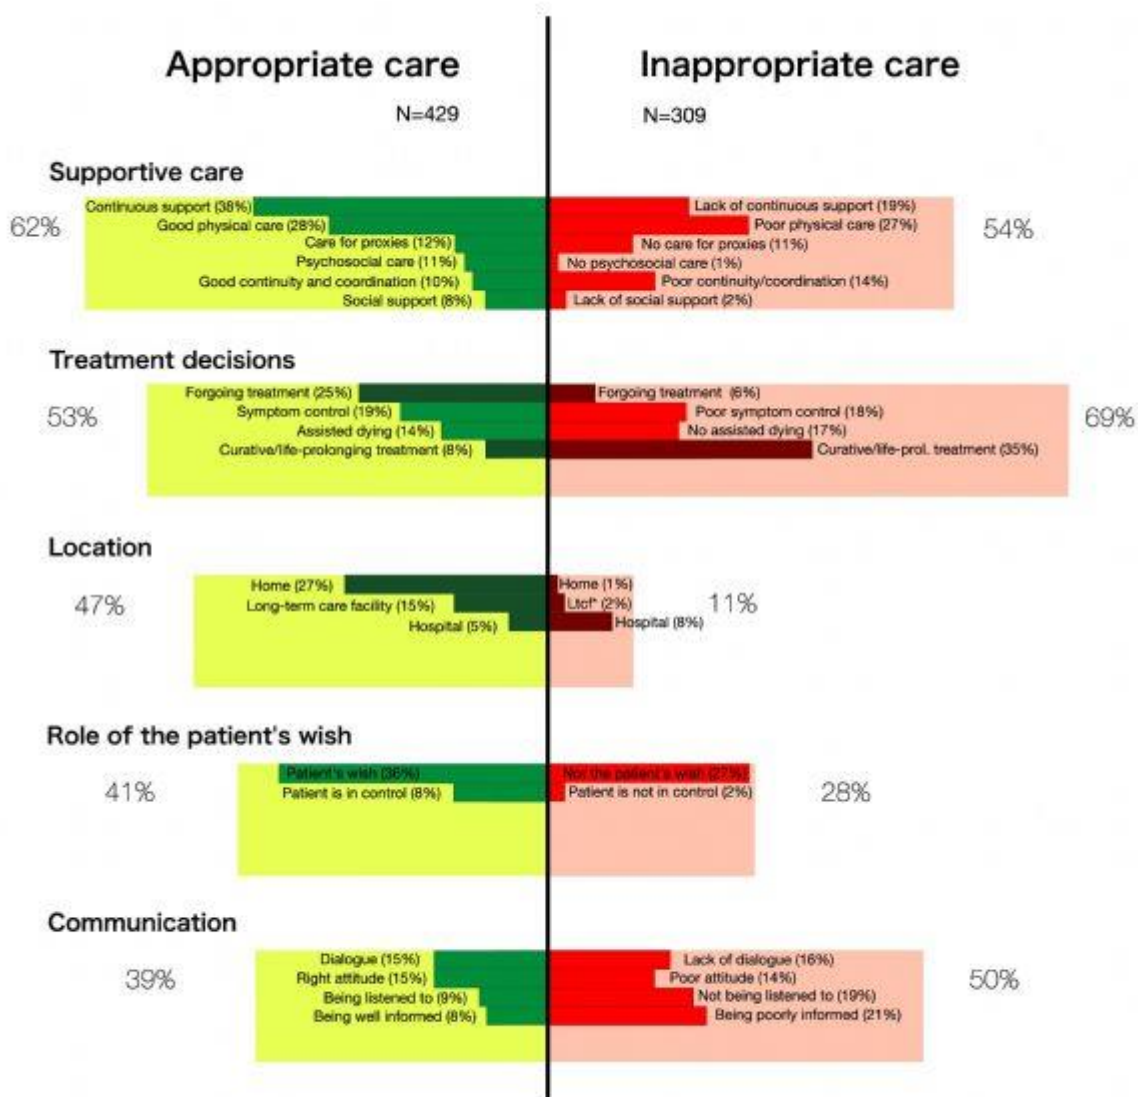

Respondents described more cases of appropriate care than inappropriate care. The cases of appropriate care were diverse, but all involved care in (one or more of) five dimensions; supportive care, treatment decisions, location, the role of the patient's wish and communication. Each of these dimensions was frequently described (39-62%). When care was inappropriate, this mostly involved inappropriate treatment decisions (69%; especially overtreatment was frequently described), and poor communication (50%; shortcomings concerning all aspects of patient-physician communication were described). There was considerable consistency in what was seen as appropriate and inappropriate care across different conditions. However, especially patients suffering from other physical diseases than cancer more often received inappropriate care.

Conclusion

From the perspective of patients and relatives, appropriate care in the last phase of life involves not only appropriate treatment decisions, but is seen as a much broader concept. By repeatedly checking whether the needs in all identified dimensions are met, inappropriate care can be prevented. Family physicians can play a key role in this.

Keywords: End of life care, appropriate care, patient perspective

Categories of appropriate (green) and inappropriate (red) care, categorized into five main dimensions

On the left, the frequencies in which the dimensions and categories were described in cases of appropriate care are shown (n=429). On the right, the frequencies in cases of inappropriate care are shown (n=309), directly next to the opposing category in appropriate care. If the category was identified both in appropriate and inappropriate care, the bar is dark. *Ltcf: long-term care facility.

OP-268

The experience of metastatic cancer: perceptions of the patients and the primary caregivers in a Middle Eastern community

Grace Abi Rizk, Remi Daou, Lara Bou Abdo

Department of family medicine, Saint Joseph university, Beirut, Lebanon

INTRODUCTION: Palliative care focuses on relief of suffering and improvement of the quality of life in patients with progressive life-threatening illness. In order to implement palliative care and promote the quality of end of life care, it is crucial to understand what quality of care means to the patients and their families. This study describes what patients with metastatic cancer and their caregivers consider to be the key elements of quality end-of-life care.

MATERIALS-METHODS: A descriptive cross-sectional study was conducted from July 2012 through April 2013, on metastatic cancer patients and their caregivers. Two questionnaires were administered to the participants in two major Lebanese university hospitals to assess their perspectives on the importance of each aspect of care. The questionnaire items were categorized in five domains (medical and nursing care, communication and decision-making, social relationships and support, meaningful existence, advance planning of care).

RESULTS: Seventy-one percent of patients and 85% of caregivers agreed to participate. The elements rated as "extremely important" most frequently by the patients and the caregivers were "to receive health care that is respectful and compassionate" (97.4% and 99% respectively) and "to have trust and confidence in the doctors looking after the patient" (93% versus 98% respectively). Significant differences in ratings of importance between patient groups and between patients and their caregivers were found for many elements of care.

CONCLUSION: In order to improve end-of-life care in Lebanon and to decrease "therapeutic obstinacy", palliative care units providing customized approaches must be implemented.

OP-269

The Partnership for Health Equity; A model for progress in tackling health inequities

Patrick O'Donnell¹, Anne MacFarlane¹, Suzanne Barror³, Fiona O'Reilly², Austin O'Carroll²

¹University of Limerick Graduate Entry Medical School

²North Dublin City General Practice Training Scheme

³Partnership for Health Equity

Background and AIMS:

This presentation will describe the Partnership for Health Equity (PHE); a unique collaboration between a university graduate entry medical school, a general practice (GP) training scheme and the Health Services Executive (the Irish National Health Service provider). The mission of the PHE is to address inequity in primary care with a programme of research, education, service provision and to inform health policy development.

METHODS:

We will explain the vision of the PHE and the programme of work to date. This includes (i) the development of several GP services for marginalised groups (ii) the conduct of research to explore access to and utilization of primary care by marginalised groups and in areas of deprivation (iii) the creation of an undergraduate and postgraduate teaching modules on social medicine, disability and cross-cultural working (iv) the creation of a forum to share findings and knowledge directly with policy makers so as to influence health policy in Ireland.

RESULTS:

Health inequity is recognised internationally as one of the main causes of multi-morbidity and premature mortality. This innovative partnership seeks to bridge the gaps between research, clinical practice, health policy and medical education when addressing health inequities.

CONCLUSIONS:

There are often significant differences between service providers, policy makers, researchers and educators in health. This can result in research taking place in isolation where findings are not translated into practice, also many problems identified in clinical practice are not researched and both educators and policy makers feel removed from the research and clinical work. This project has worked successfully to try and remedy these problems using a partnership approach. The PHE model could be replicated in other settings.

OP-270

Experiences of suicide bereavement: a qualitative study exploring the General Practitioner's role

Mairead Nic An Fhaili, Nicola Flynn, Stephanie Dowling

Department of Research, South East General Practice Training Programme, University Hospital Waterford, Ireland

BACKGROUND: Suicide is a growing phenomenon of global concern. GPs are often on the front-line in responding to a suicide. They are called upon to support individuals and families in the aftermath of suicide yet there is a dearth of research, particularly from patients' perspectives, on how to provide optimal care for those grieving a suicide.

AIM: This study set out to improve GP management of suicide bereavement by exploring the lived experiences of individuals following loss by suicide, focusing on the GP's involvement in the grief process.

METHOD: A qualitative approach was adopted using focus group interviews. Suicide bereavement support groups were identified through a national suicide prevention charity. The groups were contacted by letter. Interested participants formed 3 focus groups in 3 different locations in Ireland to reflect urban and rural views. A total of 15 adults participated. Interviews were audio recorded, transcribed and analysed thematically using the framework method. Counsellors were provided after each focus group session for participants who required support.

RESULTS: The main themes emerging from the analysis were: need for acknowledgment – of the loss, and of the lived life of the deceased; the role of stigma in the aftermath of the loss – practical implications for the patient and the surgery; and the need for the proactive provision of direction and support during the grief journey. Participants felt the GP was ideally positioned in the community to cater for the needs of the bereaved and they highlighted the positive effects of compassionate listening by the GP.

CONCLUSION: Loss by suicide can result in prolonged, complex grieving generating specific patient needs. Stigma may function as a barrier to help seeking. Therefore the GP should consider initiating contact with the bereaved. Recommendations have been made to support GPs in the management of suicide bereavement.

Effects on Blood Pressure Control in Hypertensive Patients By Sending Daily SMS

Ferhat Ekinçi, Bilge Turgut, Mehmet Akman, Arzu Uzuner

Department of Family Medicine, Marmara University, Istanbul, Turkey

BACKGROUND: According to the World Health Organization non-compliance in long term medical treatments such as hypertension, diabetes and dyslipidemia causes serious problems on patients health and general economic benefits. The average compliance ratio for using antihypertensive medications is 64%. The aim of this study is to raise compliance for medical treatment in hypertensive patients by sending daily `sms`.

METHOD: This is a randomized controlled study. Participants were selected among patients of Marmara University department of family medicine outpatient clinics and randomized into sms and non-sms groups. In each group there were 30 patients after drop outs. While everyday an sms has been send to the patients in the sms group for two months, there was no intervention for the control group except routine care. One week ambulatory blood pressure measurements have been requested twice of all the patients to make evaluation and comparison at the first and the last visit. Medicine compliance was scaled by using Modified Morrisky Questionnaire.

RESULTS: A total of sixty patients who fulfilled the inclusion criteria were enrolled in the study: 45 were female, 15 male; mean age was 55+11; mean BMI was 30+5; mean number of tablets per day was 4+2.

In intervention group, average of Systolic Blood Pressure (SBP) was 149+7mmHg, Diastolic Blood Pressure (DBP) was 87+8mmHg at the first visit; and SBP 135+10mmHg, DBP 78+8mmHg after intervention. There was statistically significant difference between the first and the last visit measurements for SBP and DBP for the intervention group ($p=0,51$ for SBP, $p=0,57$ for DBP). No statistically significant difference has been determined in the control group. In intervention group one week ambulatory BP measurements averages differed between the first visit and the last visit (SBP 145+8mmHg/DBP 82+6mmHg; SBP 131+7mmHg/DBP 73+7mmHg; $p < 0,001$). Medicine compliance ratio was 36,7% for the control group, 96,7% for the intervention group.

CONCLUSION: Reminding taking antihypertensive treatment with daily sms is an effective method to control blood pressure and and to raise compliance.

Violence towards Physicians

Huseyin Avni Sahin, Zuhâl Çakmak, Gulnihâl Guvendi, Dilek Kusaslan Avcı
Yuzuncu Yil University, Family Medicine Department, Van

BACKGROUND: The aim of the study was to determine the prevalence of violence towards physicians from patients, relatives or any other person including verbal or behavioral threat, physical or sexual assault which constitutes a serious risk in health institutions.

METHODS: This study was conducted on physicians working in Van city. A 24-item questionnaire was used by researchers, including physicians' socio-demographic characteristics and data regarding violence. Data was evaluated by using IBM SPSS Version 22.

RESULTS: Of the 220 physicians 87 (39.5%) were female and 133 (60.5%) were male, 51 (23.2%) were general practitioners, 99 (45%) were research assistants and 70 (31.8%) were specialists. Out of 220 physicians 79.5% were exposed to one or more of violence types when they were on duty and 63.2 % stated that they were exposed to violence within the last year. Of the 175 physicians, 55 (31.4%) were report the violence case. Verbal violence was found to be most common types of violence with a 92.0% while physical violence was 32.6%. Male (81.9%) doctors, single (85.5%) doctors, general practitioners (92.1%) and physicians who were working in polyclinic (54.3%) are facing more violence and harrasment than the others.

CONCLUSIONS: Violence is a growing health concern and is not a well-known issue among physicians. According to our study results, physicians were subject to high rate of violence. In order to decrease the violence rates more care should be given to investigate the cases at workplaces and further studies should be accomplished.

Mobbing towards Physicians

Huseyin Avni Sahin, Gulnihâl Guvendi, Zuhâl Çakmak, Dilek Kusaslan Avcı
Yuzuncu Yil University, Family Medicine Department, Van

BACKGROUND: Mobbing can be defined as a form of psychological harassment and terror arising from one or more person's unethical behaviour and leading to victimisation of the worker. Mobbing is a major occupational stressor and the leading problem of workers. The aim of the study was to determine the prevalence and types of mobbing towards physicians.

METHODS: This study was conducted on physicians working in Van city. A 33-item questionnaire was used by researchers, including physicians' socio-demographic characteristics and mobbing scale. Data was evaluated by using IBM SPSS Version 22.

RESULTS: Of the 209 doctors 80 (38.3%) were women and 129 (61.7%) were men. Fifty one (24.4%) were general practitioners, 88 (42.1%) were research assistants and 70 (33.5%) were specialists. Satisfaction rates of the physicians were 4.3% very satisfied, 25.8% satisfied and 69% unsatisfied. 93.3 % of the physicians stated that they were exposed to mobbing at least more than once during the previous six month. Male (96.1%) and single (93.9%) physicians, research assistants (97.7%) and physicians who were working in the university hospital (97.8%) exposed to mobbing more than the others. According to the study frequent mobbing types were; 67.9% of the physicians were blamed regarding irresponsible issues, 65.1 % of the physicians stated that their works were secretly controlled, 60.8 % of the physicians were faced to humiliating speech in front of others, 59.8% of the physicians believe that their work was regarded as worthless and insignificant by the others.

CONCLUSIONS: Mobbing is a growing health concern and is not a well-known issue among physicians. According to our study, physicians were also subject to high rate of mobbing. Mobbing has personal, social and institutional destructive effects. In order to cope with mobbing more care should be given and further studies should be accomplished.

Physical violence exposure and approaches in elementary school students' in Mardin

Betül Battaloğlu Inanç¹, Sema Çifçi², Vasfiye Bayram Değer²

¹Muğla Sıtkı Koçman University, Faculty of Medicine, Family Medicine Department

²Mardin Artuklu University, Health Higher School, Mardin.

AIM: This study was performed to determine the frequency of physical violence and to be exposed the opinion, attitude and behaviors of the primary education students about the physical violence.

MATERIAL-METHOD: All of the primary education schools were included the study at Mardin Province Center. Whole fifth and eighth class of the schools were chosen randomized and questionnaire was applied to 1351 students.

RESULTS: 50.6% of girls and 49.4% are boys. The mean age was 11.9, counts of people who lives their home was 7, average child count was 3 of the students. The 13.1% of the students were expressed that their mother was beaten by their fathers. The 42.6% of the students were exposed to violence even a time of all their whole life; the 30.7% of them were still exposed to violence from time to time.

The physical violence rate of the boys are more than the girls ($p<0.01$). The violence rate applied to children reduce with their classes, that they educated in ($p<0.01$), and fathers' educational situation advanced ($p<0.01$). Children exposed to violence higher that lives in their family in which present the domestic violence ($p<0.01$). The 15.7% of the students are still carrying on fight that includes physical violence, 5.0% of them consider that the violence is a solution.

CONCLUSIONS: The rate of the violence that exposed and considering the violence is very common. For that reason, inside of the basic health service supply; child exploitation and neglect attach importance for at primary, secondary and tertiary prevention studies, official and volunteer organizations must study together multidisciplinary for solving the problem, the programs must supported with legal arrangements and take part at government policies.

Frequency of the childhood trauma in midwifery students

Betül Battaloğlu Inanç

Muğla Sıtkı Koçman University, Faculty of Medicine, Family Medicine Department

Background &AIM: In all societies and in each culture, past and present, violence has played a role in shaping our sociocultural evolution in Turkey. The analysis of the frequency of childhood traumatic events in midwifery students and the compare correlation with depression and anxiety traumatic events were aimed in this study.

METHODS: Self-report instrument was designed to evaluate abuse and neglect experiences of childhood and adolescence in the University of Mardin Artuklu Health School the Midwifery students. Childhood and adolescence lives evaluated childhood trauma questionnaire (CTQ). Depression and anxiety relates evaluated with the Beck Depression Inventory and the Beck Anxiety Inventory.

RESULTS: The students mean age were 21.4 ± 1.9 , CTQ points average was 35.8 ± 9.1 , Beck depression inventory average points was 13.7 ± 10.4 , Beck Anxiety Inventory average points was $19,8 \pm 12,7$. The CTQ total points was significantly associated between depression and anxiety. ($p<0,001$).

CONCLUSIONS: A growing body of evidence suggests that the developing brain organizes in response to the pattern, intensity and nature of sensory perceptual and affective experience of events during childhood. Threat

activates the brain's stress-response neurobiology. This activation, in turn, can affect the development of the brain. Indeed, the developing brain is exquisitely sensitive to stress. These results could indicate that previously experienced emotional and physical traumas has more relationship to anxiety and depression symptoms and this pathological position which is an expected result of the trauma.

Fear Of Exposure To Violence In Physicians

Kamuran Bahar Sandıkcı¹, Yusuf Üstü², Mert Muhittin Sandıkcı³

¹Çubuk 5th Family Health Center, Ankara, Turkey

²Yıldırım Beyazıt University, Department of Family Medicine, Ankara, Turkey

³Department of Plastic, Reconstructive Aesthetic Surgeons, Dışkapı Yıldırım Beyazıt Research and Training Hospital, Ankara, Turkey

INTRODUCTION: Violence against health care workers is an increasingly growing problem in our country as well as all over the world. The aim of this study is to investigate the relationship between physicians' fear of exposure to physical or verbal violence between physician, patient and the healthcare system, and the effects on examination and treatment.

METHODS: This cross-sectional study was conducted on 245 specialists and 256 residents from Ataturk Training and Research Hospital, and 216 specialists and 244 residents from Dışkapı Yıldırım Bayezid Training and Research Hospital. A questionnaire including 4 Likert scales and a total of 12 questions was applied to the participants between May 15, 2013 and June 15, 2013. The answers to the questionnaire were analyzed by using SPSS 15.0 software.

RESULTS: In our study, we found that the physicians have fear of exposure to violence independent of their gender, marital status, working branches, intense working conditions, and professional experience. According to the results of the study there is a significant relationship between fear of exposure to the verbal or physical violence and experiencing a negative communication with patients and/or relatives ($p < 0.05$). The physicians stated that they finish examination of the patient primarily and move away from the patient, when they experienced fear of exposure to violence, regardless of their working branches or professional experience. The rates of confirmation of the items "I tolerate negative responses of patients towards healthcare workers due to their psychological conditions." ($p = 0.011$), "I believe I devote adequate time to the difficult patients" ($p = 0.018$), "I think, healthcare communication applied in the hospital is adequate." ($p < 0.001$), by the physicians who do not have fear of exposure to violence were statistically significant.

CONCLUSION: Physicians' fear of exposure to violence is an important problem, because it may constitute an obstacle to fulfilling the requirements of the profession and reduce the quality of healthcare services, necessary measures should be taken.

³Dr. Sadi Konuk Training and Research Hospital, Department of Internal Medicine, İstanbul.

⁴Nilüfer Kültür ASM. Bursa,

⁵Düzce 6 No'lu ASM. İzmit

⁶Gaziosmanpaşa ASM, İstanbul.

OBJECTIVE: This study aimed to determine demographic characteristics and etiologies chronic renal failure patients' who applied to nephrology clinic.

METHODS: 232 chronic renal failure patients' files, demographic specialities and etiologies evaluated retrospectively, who applied to nephrology clinic at Dr. Sadi Konuk Training and Research Hospital between February 2005 and August 2006.

RESULTS: Patients were 52.6% women and 47.4% of the man. Mean ages' of 61.7 ± 13.4 years. In our study, patients were 37.9% diabetes, 24.6% hypertension, 6.5% chronic glomerulonephritis. Diabetic and hypertensive patients' mean age years were significantly higher ($p < 0.01$). Diabetes and hypertension were significantly higher in women than men. Diabetes duration was significantly longer in diabetic nephropathic patients' ($p < 0.01$). Mean age values were not statistically different in hypertensive nephropathic patients' ($p > 0.05$). There were no statistical difference in gender in hypertensive nephropathic patients' ($p > 0.05$). **CONCLUSIONS:** Before reaching chronic renal failure stage, diabetes mellitus and hypertensive patients should be screen carefully. Identification of the patients' and starting aggressive treatment is a gold standard.

Malnutrition Screening In Home Care Elderly Patients With Mini Nutritional Assessment

Oğuzhan Tezcan, Hülya Yıkılkan, Cenk Aypak, Derya İren Akbıyık, Süleyman Görpelioğlu
Department Of Family Medicine, Dışkapı Yıldırım Beyazıt Training and Research Hospital, Ankara, Turkey

BACKGROUND & AIM: Home care elderly patients can be vulnerable to malnutrition due to their biological, psychological and social characteristics. Mini Nutritional Assessment (MNA) is an effective and easy to use tool for malnutrition screening. The objective of our study was to investigate the prevalence of malnutrition and risk factors associated with malnutrition among the home care elderly patients.

METHODS: This was a descriptive study conducted in 2015 at Dışkapı Yıldırım Beyazıt Training and Research Hospital Home Health Care Center, Ankara, Turkey. Overall, 437 home care patients aged 65 and over, were included in our study. Patients were examined at home visits, blood samples were taken and anthropometric measurements [mid-arm circumference(MAC) and calf circumference(CC)] were performed. Full Mini Nutritional Assessment(18-item MNA) and Mini Nutritional Assessment Short Form(MNA-SF)(6-item MNA) were applied to all patients.

RESULTS: The mean age of the elderly was 78.8 ± 8.5 years. Of 437 patients 67.7%(296) were females, 32.3%(141) were males. Mean BMI of elderly women and men were found to be 25.1 ± 5.3 kg/m² and 23.7 ± 3.9 kg/m², respectively. Most presented comorbid diseases among home care elderly patients were arterial hypertension(68.2%), stroke(33%), diabetes mellitus(28.6%), dementia(26.1%), coronary artery disease(23.6%), congestive heart failure(19.2%), chronic obstructive pulmonary disease (COPD)(13.7%) and hip fracture(9.2%). According to MNA-SF, 121(27.7%) of the patients were malnourished, 179(41.0%) were at risk of malnutrition and 137(31.3%) had normal nutritional status. Whereas according to full MNA, 144(33.0%) of the patients were malnourished, 183(41.9%) were at risk of malnutrition and 110(25.1%) had normal nutritional status. Of all patients 34.5% had anemia, 45.6% had hypoalbuminemia and 56.4% had serum levels of vitamin B12 lower than 125 pg/ml.

CONCLUSION: In our study we found very high prevalence of malnutrition among the home care elderly patients. Nutritional status should be periodically screened in these patients. Performing MNA as a part of routine clinical practice will contribute both to detect and prevent malnutrition.

Determination of children's growth, development and health problems in five different kindergarten in Artvin, Turkey

Vasfiye Güven¹, Mustafa Kürşat Şahin²

¹Department of Family Medicine, Medical Faculty, Ondokuz Mayıs University, Samsun, Turkey

²Canik Community Health Center, Samsun, Turkey

Background &AIM: School health services are services provided through the school system to improve the health and well-being of children and in some cases whole families and the broader community. These services have been developed in different ways around the globe but the fundamentals are constant: the early detection, correction, prevention or amelioration of disease, disability and abuse from which school aged children can suffer. This research has been performed between 1st of December and 25th of December 2013 to investigate the health and growth status of the students studying in five kindergartens placed in Artvin. **METHOD:** Refractive errors, dental and physical examination were carried out. The body mass indexes (BMI) of the students were calculated and evaluated according to the BMI tables and graphics of CDC (Centers for Disease Control). Data were analyzed using SPSS 22.0 package program. In the analysis, frequency and percentage from descriptive criteria were used. **RESULTS:** There were 140 (52.8%) male and 125 (47.2%) female students. The most common problems were decayed teeth 39 (14.7%), refractive errors 34 (12.8%) and ear problems 18 (6.8%), 14 (5.3%) genitourinary problems. 12 (4.6%) out of these students were underweight, 40 (15.4%) were overweight and 26 (10%) were obese. **CONCLUSIONS:** If decayed tooth, which is a common problem are determined and treated in early periods, teeth losses can be prevented. In addition treatment of the refractive error problems will increase the school performance of the students. Improvement of school health services is necessary for more healthy youths.

Investigation Of Some Herbal Extracts' Cytotoxicities

Betül Battaloğlu Inanc

Muğla Sıtkı Koçman University, Faculty of Medicine, Family Medicine Department

OBJECTIVE: Completely using vegetable oils, non-chemicals and non-alcoholic ingredients, an anti-mosquito repellent, non-irritant for skin and environment, was planned to produce. As a first step, our aim was to investigate the renal cytotoxicity of these extracts which will be used as insecticides was aimed.

METHODS: The all-natural oils obtained from the market were used in 100% concentration.

Extracts were prepared, cytotoxicity tests were performed at Istanbul University Faculty of Pharmacy, Laboratory of Toxicology. Extracts were applied to rat kidney epithelial cells to determine the cytotoxicity with MTT test (3-4,5-dimethyl-tiazolil-2,5-difeniltetrazolium bromid).

RESULTS: 0.625% concentrations of 1st, 2nd and 3rd extracts' caused cell death in 93%, 89% and 89%, respectively. Their IC₅₀ doses -inhibitory concentration causing a 50% decrease in cell proliferation- were found 0.265%, 0.256% and 0.041%, respectively.

CONCLUSION: First of all, 'If it is herbal, it is safe to use' concept must be once more questioned, and they must be very carefully handled especially if these agents will be used for the humans. Under the IC₅₀ concentrations, the extracts were safe in our study. The repelling time of the extracts produced in these values must be investigated and this periods must be clear. Further studies should be performed in order to use these extracts as new insecticid agents with low toxicity on normal cells.

OP-281

Drug Administration Status Of Our Patients Aged 65 Years Old And Above In Our Region

Neslihan Erkuran¹, Sebahat Gücük², Selami Kara³

¹Golyuzu primary care center, Bolu

²Abant İzzet Baysal University Department of Family Medicine, Bolu

³Bahçelievler primary care center, Bolu

BACKGROUND & AIM: We aimed to evaluate the drug administration status of our patients aged 65 years old and higher whom registered to our office.

METHOD: Our study was conducted on 410 patients aged 65 years old and higher with their informed consents whom registered to our office via family practice system, by evaluating their reports retrospectively throughout June-July 2015. Demographic characteristics, smoking status, last used medicines, drug diversity, continuously using condition of the patients and diagnosis of their reports were recorded by examination. In case of the doctor transfer in the department of family practice, when registered patients are assigned to a new doctor, some personal information of the patients may not be transferred due to lack of informational update in the current system.

RESULTS: Our study was completed with 410 patients. Gender distribution of the patients was consisted of 46,3% male and 53,7% female. Average age was 73,72±7,05. In the section of personal information, educational status belong to 93,4% of patients and smoking status belong to 94,1% of patients were not recorded on the system. 26,3% of the patients had at least one diagnosed drug report. 60,7% and 21% of the report diagnoses were consisted from hypertension and diabetes respectively.

The most frequent reason for drug administration was hypertension with a rate of 62,9%. 49% of our patients had used painkillers regularly within last year. According to regular use of medication, while 14,1% of patients had been using 4 different medications, 12,7% had been using 5 different medications.

CONCLUSIONS: When the intensity on 2nd or 3rd stage health care services are considered, we are suggesting that the drug requirements and proper drug administration status of the patients within this age group should be evaluated carefully at first step and in every interview.

OP-282

Preventive measures taken by family physicians: How much do they care about their health?

Hülya Akan¹, Levent Hekimoğlu², Nurşah Özkan³, Arzu Uzuner⁴

¹Yeditepe University, Medical Faculty, Department of Family Medicine; İstanbul

²Public Health Institution of Turkey, 12th Family Medicine Center, Bursa

³American Hospital, Family medicine, İstanbul

⁴Marmara University, Medical Faculty, Department of Family Medicine; İstanbul

AIM: It is known that medical doctors have poor self health care and disadvantage to enter health systems and also neglect to take preventive measures for themselves. The aim of this study to explore effective and appropriate utilisation of the health system, involvement in appropriate personal health screening and practice of appropriate health promoting behaviours of family physicians

METHOD: A self-questionnaire has been prepared with the consensus of researchers after relevant literature regarding evidence based preventive medicine for adults and vaccination recommendation for health care workers. By mailing about 2200 family physicians have been reached and 307 have returned back.

RESULTS: Total 172 women (56.0%) and 135 men (44.0%) included in the study. Mean age was 40.35yrs (min 24 yrs and max 64 yrs). Mean of years in profession was 15.37 yrs (min 0.25 yrs max 35 yrs). Table 1 shows the answers regarding health status and health promoting behaviours, Table 2 shows vaccination status and table 3 shows health screening and use of health system.

Conclusion

Vaccination take up rates are low regarding international recommendations especially for mumps measles rubella, pertusis and varisella. Screening for cancer and cardiovascular risks are also low except cholesterol and blood sugar screening which is surprising that none of guidelines recommend routine blood sugar screening except

having high blood pressure. An important percentage of the group describes non healthy life style regarding smoking, diet, exercise and sleeping habits. It seems that family physicians should be motivated to take preventive health measures for themselves.

Pulmonary Function Test Results of Workers Who Applied to Family Medicine Outpatient Clinic for Recruitment and Periodic Health Examination

Mehmet Özen, Hakan Akdemir

Antalya Training and Research Hospital, Family Medicine Clinic, Antalya, Turkey

Recruitment and periodic examination of workers is done by workplace physicians and family physicians. Beside history and physical examination, some laboratory tests are performed considering the profession and workplace environment. Among these tests, pulmonary function test (PFT) is an essential method for showing the affected lung function. In this study it is aimed to determine the effects on PFT values of workers' various characteristics. Data was collected retrospectively from Antalya Training and Research Hospital Family Medicine Outpatient Clinic registries and analyzed by SPSS.

In study group; 88.3% of 537 workers were male. The mean age was 40.1 ± 11.8 years. According to the body mass index (BMI) of workers, 30.2% were normal, 43.6% were overweight, 24.4% were obese. Of 430 workers didn't declare any illness and 19.9% had one or more chronic diseases. 14 workers had an obstructive lung disease. 12.0% of workers were exposed to dust in workplace and 52.5% never smoked, 35.2% currently smokers and 12.3% given up smoking. Regarding PFT results of workers, there was no statistically significant difference between men and women. There were statistically significant differences in FVC and PEF values of obese workers, in FEV1 and FVC values of workers who had employed as gardener or farmer, in FEF 25-75 values of workers who exposed to dust, in FEV1, FVC and FEF 25-75 values of workers who had chronic diseases, in FEV1 and PEF values of smokers and in all PFT parameters of workers who had respiratory complaints and pathological findings. PFT results could be affected by occupation, working duration, dust exposure at in the workplace, the presence of chronic disease, BMI and smoking status. Family physicians, when necessary, should perform PFT to workers who applied for recruitment and periodic health examination. If the test results are not normal the workers should referred to specialist.

Assessment of Frailty in Geriatric Patients in General Practice

Didem Kafadar¹, Fatma Gönül Doğan¹, Serap Bilgiç Dalkıran¹, Burak Ayça², Ertuğrul Okuyan²

¹Department of Family Medicine, Bağcılar Training and Research Hospital, Istanbul, Turkey

²Department Of Cardiology, Bağcılar Training and Research Hospital, Istanbul

Background & AIM: Frailty defines the patient in terms of exhaustion, low activity, weight loss, gait speed and grip strength. If 3 or more criteria are present the patient is frail. Presence of 1 or 2 criteria is considered prefrail stage. In elderly and in females frailty is more common. We aimed to assess frail and prefrail stages in elderly patients.

METHODS: The study was carried out among voluntary patients with cardiovascular diseases who were admitted to family medicine and cardiology outpatient clinics in 2014. The patients performed the 10 meters walking test. Hand grip dynamometer was used to measure strength. BMI was measured. Weekly exercise was questioned. Stages of frailty were determined.

RESULTS: 62 patients, 25 (40.3%) women and 37 (59.7%) men were included. The mean age was 70.4 years. 33 patients (47%) had primary education. 29% had less than primary education. 30 patients had a history of smoking. Multimorbidities; mostly hypertension and diabetes were present in 57 patients. Walking speed was slower than 0.8 meter/seconds in 18 patients. Grip strength was low in 28 patients. Frailty score was 1 or 2 in 28 patients and they were considered prefrail. 9 patients with at least 3 criteria were frail. Men having neither of the criteria were significantly more than women ($p < 0.05$). Patients in 65-70 years group ($n=32$) with neither criteria were significantly more than patients >70 years ($p < 0.05$). 72% had 4 or more medications. There were no differences between the number of medications and frailty scores.

CONCLUSION: Frailty is seen in 10-25% of elderly people. Our findings are concurrent with literature. We have defined frailty in 14% of our patient group. In patients with multimorbidities, identifying prefrail stages in daily practice may prevent the patients from going into frailty. A multidisciplinary team involving general practitioners is needed to take appropriate measures for geriatric patients who are at risk of frailty to prevent further morbidities and increase their quality of life.

Key words: Geriatric patients, frailty, multimorbidity, general practice

University Students Attitudes and Behaviors on Rational Drug use Knowledge, in Kütahya province

Yasemin Korkut, Berna Karabıyık

Department of Family Medicine, Dumlupınar University, Kütahya, Turkey

OBJECTIVE: The aim of this study is to determine knowledge-attitude behaviors of university students about rational use of drugs.

Materials and METHODS: A total of 100 participants included to the study, who accepted the via face to face communication method, at least 18 years old; in three months period (April-May 2014). All participants questioned for their knowledge-attitude behaviors on rational use of drugs. Descriptive statistics was used in order to evaluate the collected data.

RESULTS: The mean age 20.45 and 55% female, 45% were male was ill. 40% of participants is very important unless you contact a doctor, 46% of it only uses drugs given by the doctors, they use the drug according to the prescription of 67% reported that they retain 56% of the drug in appropriate circumstances. They use drugs that retain the remaining 62% for use in disease disease finished next, said two people said that they use those around the remaining drugs. Participants suggested that they use the drug until the time that 33% of physicians indicated that drug use of any herbal drug for treatment beyond 56%.

Conclusion: It is crucial and highly necessary to increase educational programmers on rational use of drugs

Tobacco Use Among Medical Faculty Student

Mavişe Esra Ünüvar, Betül Benas, Osman Özdemir, Siddıka Büşra Korkmaz, Güzel Dişçigil
Department of Medicine Family, Adnan Menderes University Faculty of Medicine, Aydın, Turkey

INTRODUCTION AND PURPOSE: Tobacco use is a serious public health problem in terms of mortality and morbidity. In our study, we aimed to determine the smoking habits of a group of students who wanted to work in the field of health and preferred to study at Faculty of Medicine.

METHOD: We planned our study as cross sectional, analytic survey. After we got the required legal permits, we administered a questionnaire among all the medical faculty students studying during 2014-2015 Academic Year. In the questionnaire, we directed such questions as how long they have been using tobacco, why they use it and the situation of tobacco use in their families. 869 students volunteered for the study. The information we obtained through questionnaire were evaluated statistically.

FINDINGS: 965 students were studying at ADU Faculty of Medicine. 869 of them (90,5%) agreed to take part in the study. The average of their ages were 21,39 (18–29). 248 students (28,5%) used tobacco products, 220 students (25,3%) just tried them. Among their tobacco preferences, 397 students (45,7%) smoked cigarettes and 96 students (11%) used other tobacco products. While we detected tobacco use in half of their families (50,1%), close friends of a huge group (76,6%) were also using tobacco products. The average of tobacco product trial age was found as 16.4 (4-27). The average of regular use age was 18,48 (9-24). Among their reasons, we determined that curiosity was 66,8%, homemate or roommate use was 11% and the fear of being alone among friends was 4,8%. The period of their use was 1460 days. The reasons for continuing tobacco use were determined as; curiosity was 44,1%, other reasons were 40%, homemate or roommate use was 12,9% and high pressure for use was 5,9%. The number of regular users was 145 (67,8%). 101 students were smoking their first cigarettes in the first one hour after waking up in the morning. The number of cigarettes they smoke a day was 12.5.

RESULT: Tobacco use rate among ADU Medical Faculty Students was 28.5% (248). 67.8% of these users were regular users. Friends and family members of significant number of students were also using tobacco products. The mostly stated reason for tobacco use is curiosity.

Knowledge Levels Of University Students About General Health Insurance

Suat Sıncan¹, Kenan Taştan², Coşkun Öztekin²

¹Yakutiye Public Health Center, Erzurum

²Atatürk University Research Hospital Division of Family Medicine, Erzurum

Objective: According to General Health Insurance application; students over the age of 25 and students have no social security in their parents, should apply to the Social Assistance and Solidarity Foundations and should be made income test. The highest level of health insurance premiums is reflected those who do not make the income test. These may be the inability to benefit from health services due to debts. In this study, we aimed to investigate situation of making income test in university students.

Method: A verbal survey applied to university students who came to a family medicine unit in Atatürk University Family Health Center between March - June 2015.

Results: In this study, 1023 university students were evaluated, 772 women (75.4%), and 251 male (24.6%). The mean age of participants were 20.7 years (range: 17-39). 66 persons of participants (6.4%) made the income test, but 957 persons of participants (93.6%) did not. While making the test 881 (92%) of participants didn't know that you need to make an income test. 17 (26%) of the 66 students who made the income test, couldn't pass the test. So they must pay health insurance premiums itself but they don't do it due to become a student. 6 (32%) of these

17 participants said they admitted to health facilities, when they are sick, with the identity of others, because of the debt.

Discussion: University students don't know, they must make an income test. Therefore, the insurance premium debts are increasing. The increase in the number of those who have the income test, will increase the number of students who fail to pay the premium

In this situation, the physician - patient relationship, which will affect in a negative way, it can increase the number of health centers with someone else's identity applications.

Keywords: General health insurance, university student, the income test

Acute Lymphoblastic Leukemia

Efsun Akin, Tolga Gunvar

Department of Family Medicine, Dokuz Eylul University, Izmir, Turkey

Introduction and OBJECTIVE: Acute lymphoblastic leukemia (ALL), is rapidly progressive and gets worse quickly if not treated. It is the most common cancer of childhood (%80). Although there is no visible reason in most cases; being male, white race, over 70 years old, a history of chemotherapy or radiotherapy, ionized radiation, exposure to toxic substances such as benzene and pesticides, having some inherited diseases such as Down Syndrome are potential risk factors for ALL. Easy bleeding with decreasing number of platelets, fever and infections with the non-availability of mature white blood cells, anemic symptoms such as fatigue, shortness of breath, easily exhaust arises with the lack of red blood cells. It often presents with non specific symptoms similar to those of benign conditions, leading to delays in the diagnosis and initiation of appropriate treatment. Primary care physicians should have a raised index of suspicion and explore the possibility of cancer in children who have worrisome or persisting signs and symptoms. In the full blood count, the number of leukocyte may be high, low or even normal. Anemia and thrombocytopenia mostly exists. Approximate number, changes in the shape and abnormal cells can be detected in peripheral blood smear.

CASE: 7 years of boy with no known illness, applies to the family physician with the symptoms of fatigue and cough, 3 weeks ago before applying to the DEU Pediatrics General Polyclinic. Antibiotics prescribed by the doctor and advised to come again after the end of antibiotics for the iron treatment for fatigue and paleness. Because of the increasing complaints of weakness, family refers to the Pediatric Emergency service. General physical examination showed no pathology other than common paleness.

Discussion and RESULTS: Cough, fever, weakness, sore throat symptoms are known as simple upper respiratory tract infection, but the relationship between the underlying initial phase of diseases and these symptoms must not be forgotten.

The importance of exercise physiology for obese patients followed by acupuncture treatment

Yılmaz Sezgin

Surmene State Hospital, Family medicine, Trabzon

INTRODUCTION: Activities such as walking, swimming, cycling and tennis supplying equate oxygenation of tissues is defined as aerobic exercise. The exercise must include at least 30 minutes a day, at least five days and a total of 150 minutes per week. The exercise, made regularly reducing insulin resistance, increasing muscles glucose utilization and fat oxidation play an important role in the treatment of obesity.

METHODS: This study was a retrospective case control study. The effects of exercise for obesity patients followed by acupuncture treatment were investigated. The patients who quadrated recommendations exercise or not separated two groups as cases and controls. Acupuncture treatment was applied as ear acupuncture once a month. Patients were invited for check in 15 days periods. Regular exercise was proposed all patients. The data belong to 15th day and 30th were evaluated by paired two sample test.

RESULTS:

15th day

All of the patients complying exercised were found reducing their weight (weight means from 98.60 ± 20.28 to 95.10 ± 19.91 , $n = 10$, $p = 0.004$). 55.5 percent of the patients not complying exercised were found reducing their weight (weight means from $99,61 \pm 18.49$ to 98.39 ± 18.44 , $n=18$, $p = 0.007$).

30th day

All of the patients complying exercised were found reducing their weight (weight means from 106.17 ± 20.64 to 100.33 ± 19.98 , $n = 6$, $p = 0.001$). 38.4 percent of the patients not complying exercised were found reducing their weight (weight means from $101,38 \pm 21.21$ to 99.23 ± 21.01 , $n = 13$, $p = 0.006$).

INCONCLUSION:

Aerobic exercise for obesity patients followed by acupuncture treatment provides more significant improvement to losing weight. we suggest that aerobic exercise for the energy consumption of the organism by carbohydrate utilization and fat oxidation should be applied.

¹¹centro de salud betanzos, a coruña, spain

Objective. To find out the degree of control in patients who undergo INR monitoring at health centres in the Autonomous Region of Galicia.

Patients and methods. Cross-sectional study conducted in patients over 65 years of age, diagnosed with Nonvalvular Atrial Fibrillation, who have been receiving anticoagulant therapy for more than one year. INR values were recorded for a minimum of 6 months and a maximum of 12 months. Good control was considered to be when the time in therapeutic range (TTR) was above 65% calculated using the Rosendaal method or 60% estimated by the number of controls.

Results. 511 patients were included, 53.0% women and a mean age (SD) of 77.8±0.6 years. 41.5% of the patients presented <60% of the controls performed within therapeutic range and 42.7% showed a TTR of <65%, calculated using the Rosendaal formula. A greater number of drugs (6.8±0.4 vs 5.7±0.3, p<0.0001), a greater prevalence of kidney disease (24.3% vs 17.0%, p=0.05) and a higher Has-Bled score (3.8±0.1 vs 2.5±0.1, p<0.0001) were observed in the group of patients with poor control.

Conclusions. More than 40% of the patients receiving anticoagulant therapy do not achieve the minimum time in therapeutic range to benefit from this treatment. The variables that influence poor control are kidney disease and a high risk of cerebral haemorrhage.

More than just nodules

Jorge Hidalgo¹, Giovanna Lovatón²

¹Hospital Mútua de Terrassa

²Consorti Sanitari de Terrassa

Clinical case

A 32 year old female patient with relevant medical history of thrombocytopenia at 20 years of age without medical supervision, depression treated with antidepressants for a short period and also an acute respiratory distress episode correlating with a diffuse bilateral alveolar hemorrhage 3 years ago that went under study without final diagnosis despite multiple medical procedures such as CT scan, bone marrow and bronchoscopy biopsy.

Familiar history of multiple sclerosis.

Consults in august of 2014 for one week of bilateral metacarpophalangeal pain, the physical examination consists in painful flogotic mobile nodules in her right hand.

Four days later besides anti-inflammatory medication reconsults for persistent pain and proliferation of thoracic and left knee nodules. With the presumption of inflammatory disease a rheumatology consultation is conducted. Laboratory Findings: Blood test showed bicytopenia, with negative acute phase reactants markers. Hand x-ray is conducted without any findings. Chest x-ray showed hilar enlargement suggesting adenopathies. CT scan with bilateral mediastinic and hilar adenopathies that confirmed previous x-ray. Finally, hand nodule biopsy showed granulomatous inflammatory non necrotizing tissue, compatible with sarcoidosis.

Conclusions: Sarcoidosis is a chronic idiopathic multisystem granulomatous inflammatory disease of unknown etiology its prevalence is 3-5/100000 habitants with the highest incidence at 25-40 years old.

Approximately 5% of cases are asymptomatic and incidentally detected by chest radiography. Systemic complaints of fever, anorexia and arthralgias occur in 45% of cases. Pulmonary complaints occur in 50% of cases, with symptoms like dyspnea on exertion, cough, chest pain and hemoptysis wich is rare.

The diagnosis is based on a compatible clinical and/or radiological picture, histological evidence of non caseating granulomas and exclusion of other disease of producing a similar histological or clinical manifestations.

Type 2 Diabetes: Knowledge of the disease, impact of variables Sex, Years of Evolution and Academic Training on it

Jose Antonio PASCUAL Lopez¹, Pedro María Martínez López¹, Javier Aracil Fernández¹, Alfredo Pérez Carrillo¹, Concepción Martínez Delgado¹, María Ros Marín¹, María Dolores Vazquez García², Hebab Saas Bob Bachir¹, Francisco Javier Fernández Valero¹, Noelia Benítez Samuel¹, Juana Noelia López Pastor¹, Andres Egea Huertas¹

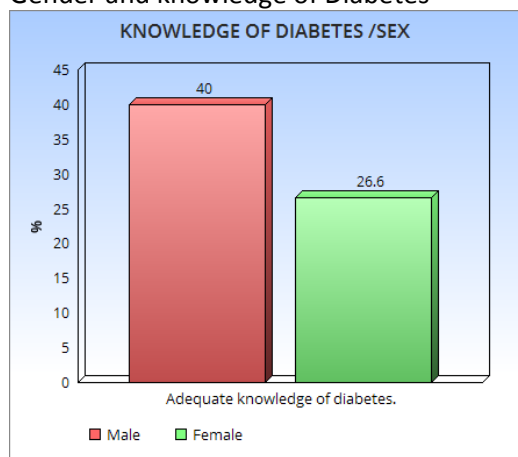

¹Centro de Salud de Calasparra. Gerencia del Noroeste. Servicio Murciano de salud. Murcia. Spain.

²Centro de Salud Barrio del Progreso. Gerencia Area VII. Servicio Murciano de Salud. Murcia. Spain.

- Objective: To determine the relevance of gender, years of evolution and level of education in diabetes control as well as knowledge of the disease in our diabetic population

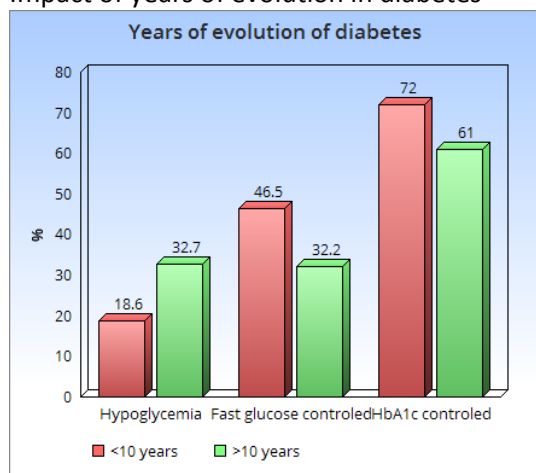

- **METHOD:** Quality assurance methodology. Rural Field. Simple random sampling. We collect biographical (sex, age, academic training and years of evolution), clinical and laboratory data, assess understanding of the disease using a validated test, adherence to treatment by Morinsky-Green test, family support and diabetes group membership. G-Stat statistical software. Chi-square.
 - **RESULTS:** Gender: homogeneous distribution of glycemic control, SBP, LDL, snuff consumption, family support and diabetes group membership. At least one hypoglycemia: 17.5% of men, 32.4% of women; three or more per year: 5% of men, 17.6% of women. Adequate knowledge of their disease: 40% of men, 26.6% of women. Years of evolution: fasting glucose controlled: 46.5% (<10 years), 32.2% (>10 years). HbA1c control: 72% (<10 years), 61% (>10 years). Existence of hypoglycemia: 18.6% (<10 years), 32.26% (>10 years). Therapeutic adherence: 69.8% (<10 years), 88.5% (>10 years). Academic training: HbA1c control: 66% (basic), 75% (secondary). SBP controlled: 56% (basic), 75% (secondary). LDL control: 41% (basic), 58% (secondary). Smoking: 14.5% (basic), 8.3% (secondary). Diabetes group membership: 3.2% (basic), 16.67% (secondary).
 - **CONCLUSIONS:** Gender is not a variable that generates many differences and according to our analysis none of them is statistically significant. In diabetics with over 10 years of evolution worsen glycemic control and the presence of hypoglycemia, but improves treatment adherence, being no statistically significant difference. Academic training (no-basic / secondary-university) shows important differences in favor of the second group in almost all aspects studied. The difference is significant in diabetes group members and probably would be others with a larger sample size
- Keywords: Type 2 Diabetes Mellitus, Sex Factors, Rural health center

Gender and knowledge of Diabetes

Gender is not a variable that generates many differences and according to our analysis none of them (even this one) is statistically significant.

Impact of years of evolution in diabetes

In diabetics with over 10 years of evolution worsen glycemic control and the presence of hypoglycemia

Prurigo Nodularis And Autoimmune Polyglandular Syndrome (APS) Type II: A Case Report

Zeynep Polat¹, Hatice Gül Saęun², Sema Erdoęmuş¹, Zuhâl Saęlam¹

¹Department of Family Practice, İstanbul Medeniyet University Göztepe Training and Research Hospital, İstanbul, Turkey

²Department of Internal Medicine, İstanbul Medeniyet University Göztepe Training and Research Hospital, İstanbul, Turkey

BACKGROUND AND AIM

Autoimmune Polyglandular Syndrome (APS) is a combination of multiple endocrine and nonendocrine organ deficiencies with a rare incidence. 4 subtypes are defined. Type II APS is characterized by the obligatory occurrence of Addison's disease in combination with autoimmune thyroid diseases and/or with Type I DM. In primary care practice the components of APS which are thyroid disease and Type I DM are commonly observed. In this case report, a Type II APS case is presented in order to remind the management of this kind of combined disorders.

METHOD AND RESULTS (CASE)

A 75-year-old female presented to the Emergency department with fatigue, widespread itching and skin eruption. The patient had consulted to dermatology one week ago and diagnosed as scabies, topical medical treatment had been prescribed. The medical history revealed IDDM, hypotiroidism and vitiligo. The patient had hyponatremia and hyperkalemia (Na:127 and K:6.5 mEq/l). In differential diagnosis, Addison disease was considered. Basal serum cortisol was 7.6 ug/dl and ACTH was 65.7 ug/dl. Synacten test revealed serum cortisol was 14.6 and 13.6ug/dl at 30 and 60 min. respectively. Histopathologic evaluation of skin was consistent with "prurigo nodularis" which is common at autoimmune diseases. The patient was diagnosed with Addison disease and treated with 5 mg/day oral prednizolon. On the 3rd day of the treatment, the itching recovered and the patient was discharged with improving laboratory results as Na:135 mEq/l, K:5.5 mEq/l. For the time being she is under control having regular visits at Endocrinology Department.

CONCLUSIONS

In primary care practice, patients are longitudinally cared for. "Long-term following" of a patient with any chronic disease requires a comprehensive approach. We present this case to make a point of multi-endocrine disorders which we may possibly observe the symptoms independently and yet may misdiagnose in daily practice.

⁴Department of Pediatric Surgery, Karabuk University, Karabuk, Turkey

⁵Department of Emergency Medicine, Karabuk University, Karabuk, Turkey

⁶Department of Internal Medicine, Haseki Education and Research Hospital, Istanbul, Turkey

Objective: Heart failure is the most common and important disease. Diagnosis and treatment of heart failure developments in recent years. Depression is an important health problem due to effect on quality of patient life and increasing frequency of hospitalization and mortality. In this study, we examine hospitalized patient with heart failure and non-heart failure of chronic illness and their situation socio-demographic characteristics.

METHODS: We included 30 chronic heart failure of patients and 30 non-heart failure chronic diseases of patient at hospitalized in Internal Medicine Department for this study. Patients who have got psychiatric and neurological diseases is refused from this study. We used questionnaire of Beck Depression Scale of all of the patients.

RESULTS: There are depression in 22 patients with heart failure and 18 patients non-heart failure. We found no statistically significant difference between in each groups. We didn't find difference for patients aware survey or treatment disease. Limitation life moving is increased depression symptoms.

CONCLUSION: Hospitalizations are increased the incidence of chronic disease depression. Heart failure is not additional factor for depression. Physical activity of the patients will be beneficial improvement depression findings therefore physical activity of patients should have increased.

Who cure my diabetes? My friend and insulin

Kok Wai Kee

National Healthcare Group Polyclinics, Singapore

Chronic care management of newly diagnosed type-2 diabetes mellitus (T2DM) has always been a challenge. The importance of family or friends involvement usually overlooked. There is variable evidence on early insulin therapy in maintenance of pancreatic beta-cell function. This case report illustrated a patient in poor glycaemic control, without family support, achieved sustained good glycaemia with the help from a friend and after completed 1 year of basal insulin therapy.

NYS is a 50 year-old Chinese gentleman, a drifter, who presented with osmotic symptoms of hyperglycaemia. He has 3 siblings but not in good terms. He sleeps in public areas. He has a good friend who helps to buy food for him everyday. On diagnosis, random plasma glucose was 28.6mmol/L (514.8mg/dL) and HbA1c was 19%. He declined immediate hospital admission. He was started on oral hypoglycaemics and doses were titrated up to metformin 850mgTDS and glipizide 10mgBD. Combined care with nurses and dietician was done. Despite these, his HbA1c ranges 11.1-14.1%. Basal Insulatard was initiated with doses ranging from 8-12U ON. His friend helped in insulin

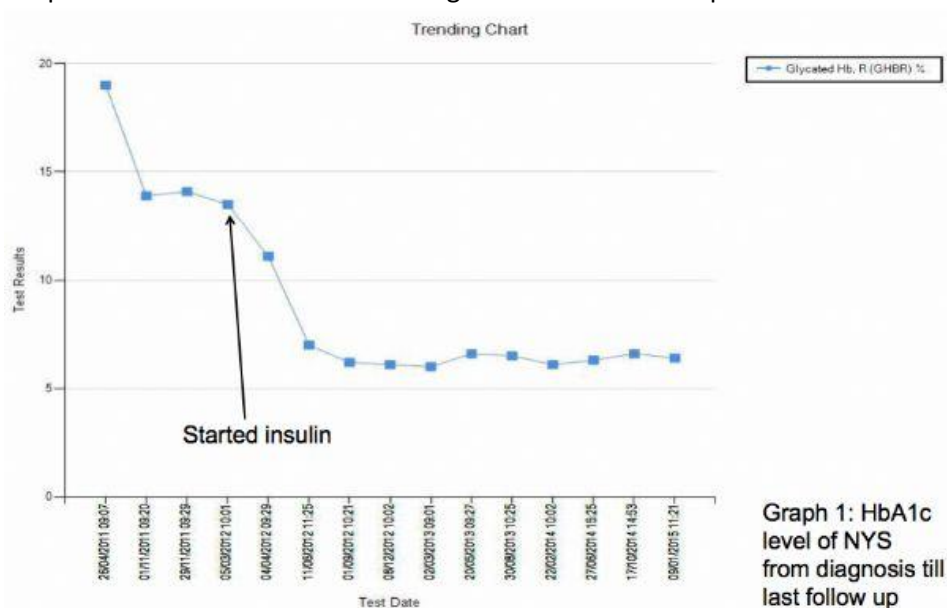

injection as patient was unable to perform himself.

A subsequent drop in HbA1c to 7% was achieved. Insulin was stopped after 1 year in view of good glycaemic control. Throughout 15 months follow-up period without insulin, his HbA1c was maintained at 6.1-6.5% with glipizide 5mg OM and metformin 500mg BD.

A combination of two hypoglycaemic agents and extensive lifestyle changes failed to achieve good glycaemic control. Basal insulin initiation with a possible reversal of pancreatic beta-cell dysfunction due to initial gluco-toxicity, managed to achieve sustainable good glycaemia. Despite poor family support, help from a close friend contributed to the major success. Further studies on early initiation of insulin for newly diagnosed diabetes with poor glycaemia, is needed to support the hypothesis of pancreatic beta-cell preservation.

Frequency of Complications of Diabetes Mellitus typ 2

Albina Softic¹, Azijada Beganlic², Nurka Pranjić³

¹Public Health Center Gracanica, Gracanica, Bosnia and Herzegovina

²Public Health Scientific Institution Tuzla and Educational Family Medicine Center Tuzla, Tuzla, Bosnia and Herzegovina

³University of Tuzla Medical Faculty, Tuzla, Bosnia and Herzegovina

BACKGROUND: Diabetes mellitus type 2 is one of the leading causes of morbidity and mortality in the world. During the last decades diabetes mellitus typ 2 increasingly affects younger people, and it is a serious health's risk factor worldwide. Due to the complications of diabetes, it requires constant care for these patients.

AIM: The aim of this study was to determine the frequency of complications of type 2 diabetes mellitus among patients who were treating in Family Medicine Department, Public Health Center Gracanica.

METHOD: A retrospective cross-sectional study was conducted on patients suffering from type 2 diabetes mellitus for more than five years. The following parameters were: age, sex, duration of disease, smoking status, BMI and complications: nephropathy, retinopathy, CAD (coronary artery disease) and polyneuropathy.

RESULTS: Average age was 59.8 years. Average disease duration was 12.3 years. Of the total number of respondents females were 45% and 55% males. Smokers was 37.5%, former smokers was 25% and non-smokers was 37%. Obese subjects was 47.5%, 32.5% overweight and normal body weight subjects 20%. Nephropathy had 62.5% of respondents, retinopathy had 82.5%, CAD 45% and 72.5% polyneuropathy.

CONCLUSIONS: Complications of type 2 diabetes mellitus in patients are highly frequent. Due to the average age of the patients can be concluded that these patients will have a significantly reduced quality of life in the future and be a huge burden to the health system. Significant efforts are needed in the primary prevention of type 2 diabetes mellitus for future generations, and prevention complications in patients with new diagnosis of diabetes.

Impact of motivational counselling on treatment outcomes in primary health care patients with diabetes

Biljana Katic¹, Amela Vicanovic¹, Maja Racic², Bojan Joksimovic³

¹Primary health care Center Bijeljina

²Department of primary health care and public health, University of East Sarajevo

³Department of physiology and pathophysiology, University of East Sarajevo

BACKGROUND: Motivational counselling (MI) is a patient-centred counselling approach that actively engages patients and draws on their underlying readiness and motivation to change behaviour.

AIM: The purpose of this study was to determine the impact of motivational counselling on treatment outcomes in patients with diabetes.

METHODS: The study included 200 patients with diabetes mellitus registered in Primary Health Centre Bijeljina, Bosnia and Herzegovina. Before the study was conducted, the patients were allocated into two groups. The first group consisted of 100 patients who were included in three months long program of motivational counselling. The second group consisted of 100 participants who obtained patient education as a part of their regular care in family practice. The measures used to portray patient's treatment outcomes included fasting blood glucose level, HbA1c, blood pressure, cholesterol, body mass index and smoking status.

RESULTS: Statistically significant differences in fasting blood glucose level, HbA1c levels, blood pressure and serum cholesterol level were found between two groups, while statistically significant differences in body mass index and smoking status were not found between the groups at follow-up.

CONCLUSION: Diabetes as a chronic disease is complex, it demands not only the control of glycemia but the change of life habits that is often very difficult. The function of a doctor as an educator and motivator, is great and important, it demands constant learning, and the change of the doctors behavior for the better to achieve mutual satisfaction.

Keywords: diabetes mellitus, motivational counselling, primary health care

Relationship between Diabetes Mellitus and Depression in Primary Care

Brenda Elizabeth Riesgo Escudero, Susana Elizabeth Riesgo, M Dolores García Moriano, Nuria Tuset Mateu, Esther Bracero Alonso, Lidia Evangelista Robledo, Antonio Carpintero Campos, Elena Pintado Outumuro, Davinia Blanco Cañas

Institute Catalán de la Salud, Barcelona, Spain

OBJECTIVE: To study the prevalence of depressive syndrome (DS) in patients with type Diabetes Mellitus2 (T2DM), to assess the associated determinants, and to determine whether the presence of DS affects the degree of metabolic control in T2DM.

MATERIAL-METHODS: Cross sectional study including 313 patients diagnosed with T2DM and registered in the eCAP database from a primary care center located in an urban area of the city of Barcelona, Spain.

VARIABLES: sociodemographic data, DS diagnosis according to DSM-IV, comorbidity (abbreviated Charlson Index), primary care consultations (doctor's or nurse's visits), laboratory parameters, self-monitoring, and adherence to treatment (AT) to oral antidiabetics (OA) based on pharmacy-prescription data.

Good adherence to treatment was considered when: Withdrawal of pharmacy $\geq 80\%$ of prescribed doses and good metabolic control: $HbA1c \leq 7\%$ AT.

RESULTS: The study included 313 diabetic patients with a mean age of 67.6 years (standard deviation [SD] = 10.6). The overall proportion of men was higher than women (53%), and the overall frequency of depressive syndrome was 26.2%.

It was observed that 64.6% of patients had a good glycemic control; 56.1% of them used self-monitoring test strips; 64.8% had a good TA; and 29.3% had a Charlson comorbidity index ≥ 3 .

With regard to visits, there were a mean of 12 visits/year to the doctor's office (P-value < 0.001), and a mean of 10 visits/year to the nurse's office (P = 0.001).

As for DS, the mean age of patients was 69.5 years with more than 10 years of evolution of T2DM. (P = 0.022); 48.1% were married; and 60.5% were uneducated.

CONCLUSION: There was a lower prevalence of DM in male patients with T2DM. Patients with DS were more likely women, attended the doctor's or nurse's office more frequently, had a longer disease progression, and were less educated.

Keywords: diabetes mellitus/depression/primary care

Table 1. Factors associated by the presence of depressive syndrome. Bivariate analysis. Rate (%) was measured sample (ED).

Depressive Syndrome	Yes (n=492)	No (n=961)	p value
Age	72,6 (11,8)	70,6 (11,9)	0,533
Men	174 (35,4%)	575 (59,8%)	<0,001
Medical attendance*	9,0 [9,00; 16,0]	7,00 [5,00; 13,0]	<0,001
Nursing attendance*	8,0 [7,00; 14,0]	8,00 [4,00; 11,0]	0,001
Years of evolution*	10,0 [6,25; 15,0]	8,00 [6,00; 11,0]	0,022
HbA1C Control	310 (33,6%)	613 (66,4%)	0,728
Insuline Therapy	109 (22,2%)	156 (16,2%)	0,006
Compliance oral antidiabetic	383 (77,8%)	805 (83,8%)	0,006
Charlson ≥ 3	111 (22,6%)	169 (17,6%)	0,021

In multivariate logistic regression analysis was only being male SD protective factor (OR: 0.15 95% CI 0.07 to 0.31) with a statistically significant association.

The diabetic foot ulcers are the most morbid and mortal complications of diabetes. It occurs at a rate of % 25 in a life time. Having diagnosed with a chronic disease and the loss of organs due to its complications can cause psychological trauma, even an undiagnosed post-traumatic stress disorder (PTSD) that can effect success of treatment and lead life-threatening complications.

The 47-year-old woman who was diagnosed as type 2 diabetes admitted to a University Hospital with an open wound in the dorsal-lateral on left foot. She was using intensive insulin therapy and had an amputation six years ago (fingers of her right foot). She couldn't walk comfortably for the last 4 months due to development of Charcot joint. She was dependent for her daily activities. Her inversion, eversion, ankle flexion, and extension, abduction and adduction movements were limited. She was discussed at the diabetic foot council during her hospitalization at endocrine service. Tigecycline was used, however, council consisting of orthopedics, dermatology, endocrinology and infectious diseases specialists suggested abscess drainage and foot amputation. However, she refused the suggestion, became anxious and agitated when informed. Psychiatric consultation reported that she could test reality but she wasn't susceptible to any suggestion. Her probable diagnosis was PTSD. She was informed once again but refused the treatment, and discharged with medical treatment.

The family physicians should keep in mind that diabetic patients can experience also psychiatric problems such as PTSD along with serious complications like diabetic foot. Psychiatric problems can cause difficulty in management of diabetes and its complications. They have to be attentive about psychiatric issues in patients with complicated, difficult cases.

24 Hours Ambulatory Blood Pressure Monitoring in Primary Care

Laura Maldarytė¹, Kazys Simanauskas²

¹2nd year resident in GP/FM, Department of Family Medicine, Vilnius University, Vilnius, Lithuania

²GP specialist PhD MD, Vilnius University Hospital Family Medicine Centre, Lithuania

INTRODUCTION: Arterial hypertension - one of the risks of cardiovascular diseases. In Lithuania the mortality of them is 56,1% (2010ye). It is possible to minimise the diseases by detecting high arterial blood pressure and controlling it effectively changing the way of life or using antihypertensive drugs.

OBJECTIVES: To evaluate the benefit of 24 hours ambulatory arterial blood pressure monitoring, suspecting or

treating patients with arterial hypertension.

METHODS:

Study: Prospective cross-sectional study;

Population: Patients enrolled and followed in Vilnius University Hospital Family Medicine Centre, Lithuania;

Inclusion Criteria: suspected arterial hypertension or hypertension despite antihypertension treatment from June/2013 till November/2014;

Sample: Patients that met the criteria.

Type of source of data: Clinical records, arterial blood pressure monitoring results.

Statistical Analysis: SPSS 17, Microsoft Excel 2010.

RESULTS: 150 patients. Mean age 54,15 ($\pm 15,13$), 74 (49%) women. 78(52%) hypertension not diagnosed before monitoring, 28(35,9%) of them hypertension newly diagnosed.

The most often complaints - high arterial blood pressure (ABP) (33.6%), heart ache (31.5%), weakness (28.9%), no complaints (3,4%). Statistically significant correlation between complaints and treatment adjustment - only between high ABP and treatment adjustment (Spearman 0,371, $p=0.000$). The most frequent distribution of antihypertensive drugs after ambulatory blood pressure monitoring - ACF (49,3%), BBC (39,1%), CCB (31,9%). Cardiologists statistically significantly adjusted CCB, sulfonamide diuretics. Other drugs cardiologists and GPs adjusted statistically similarly. 3 (10,7%) newly diagnosed patients' AH was not treated - the change of life was recommended, 25 (89,3%) got antihypertensional treatment. For 17(68,0%) patients with newly diagnosed hypertension, the blood pressure was adjusted by GPs.

CONCLUSION: The results show that hypertension can be detected by 24 hours ambulatory arterial blood pressure monitoring. Many patients feel nonspecific signs. The hypertension adjustment between Cardiologists and GPs is similar.

Keywords: ambulatory blood pressure monitoring, arterial hypertension, antihypertensional treatment.

³Atakum community health center, Samsun, TURKEY

⁴Chief of Internal Medicine Department, Samsun Training and Research Hospital Chief, Samsun, TURKEY

Immobilization hypercalcemia (IH) mainly results from rapid bone turnover and may be seen after spinal cord injury or long bone fracture in particular in children and adolescents. The pathophysiology of this entity is entirely unknown. A-19 year-old, male quadriplegic adolescent was referred to our outpatient clinic by a family physician. At presentation he had some vague symptoms due to hypercalcemia including fatigue, nausea, vomiting, anorexia, constipation and dehydration. Laboratory investigations for hypercalcemia revealed low intact parathyroid hormone level, low 25-OH vitamin D, and high 24-hour urine calcium. He was diagnosed as having IH after all other causes of hypercalcemia were excluded. The pathophysiology of IH remains unclear. Treatment is directed towards lowering the serum calcium level. Up to date, intravenous hydration with isotonic saline, furosemide and salmon calcitonin have been the conventional therapies. Other treatment options include bisphosphonates (such as etidronate, zoledronate or pamidronate) or, an inhibitor of receptor activator of nuclear factor kappa-B ligand (RANKL), denosumab. IH is a rare cause of hypercalcemia. Physicians should be aware of this condition when seeing patients with restricted physical activity.

Keywords: Hypercalcemia, immobilization, quadriplegia

Clinical evaluation of the risk of stroke in family medicine

Esad Alibasic¹, Enisa Ramic², Olivera Batic Mujanovic², Ahmet Tuzlak¹, Emir Alibasic³, Irma Ramic³

¹Department of Family Medicine, Primary Health Care Center Kalesija, Bosnia and Herzegovina

²Department of Family Medicine, Primary Health Care Center and Polyclinics Dr Mustafa Sehović, Tuzla, Bosnia and Herzegovina

³Medical Faculty, University of Tuzla, Bosnia and Herzegovina

INTRODUCTION: Stroke is a common a problem that has to be well evaluated and triaged in the practice of family medicine.

OBJECTIVE: To analyze the prognostic value of the ABCD2 scoring system for stroke occurrence after transient ischemic attack (TIA).

Patients and METHODS: ABCD2 scoring method includes following clinical conditions: Age, Blood pressure, Clinical Presentation, Duration, and Diabetes mellitus. The highest possible score is 7. The score is calculated as follows: years of Age > or = 60 [1 point]; Blood pressure > or = 140/90 mmHg [1]; Clinical features: one-sided weakness with or without speech disorder [2], or speech impairment without weakness [1]; the Duration of TIA > or = 60 min [2] or 10-59 min [1]; Diabetes [1 point]. The results of the clinical presentation of TIA (as defined on the basis of the criteria of the World Health Organization) were retrospectively compared with the results of the patient's discharge letters or findings of neurologists and the results of cerebrovascular imaging (CT and CD results) of the patients who had proven ischemic stroke.

RESULTS: Total of 60 patients were analyzed, of which 28 (46,6%) were women. The average age was 58. 12 (20%) patients were classified as high risk (ABCD2 score 6-7), 28 (46,6%) as moderate risk (ABCD2 score of 4-5), and 20 (33,3%) patients as low risk (ABCD2 score 0-3). The risk of stroke in following two days ranged from 1,6% in patients with a lower score, 5% in patients with moderate score and 8,3% in those with higher score.

CONCLUSION: Higher ABCD2 score is associated with a higher risk for the development of ischemic stroke during 2 days after occurrence of TIA. Patients at high risk need immediate evaluation and optimization of stroke prevention. Stroke occurrence after TIA is highly predictive by utilizing ABCD2 scoring method.

Type 2 Diabetes Mellitus: Patient Characteristics at Initial Diagnosis

Lorraine Scanlon¹, Katie Murphy², Carthage Moran³, Colin Bradley², Joe Moran²

¹School of Medicine, University College Cork, Western road, Cork City, Ireland

²Department of General Practice, Western Gateway Building University College Cork, Western Rd. Cork City, Ireland

³Department of Medicine, University College Cork, Clinical Sciences Building, Cork University Hospital, Cork City, Ireland

Background and Aim: The incidence and prevalence Type 2 Diabetes Mellitus (T2DM) is increasing. Diabetes in General Practice (DiGP) is an educational forum for Irish General Practices aiming to improve their care of patients with T2DM. We investigated the characteristics of T2DM patients at initial diagnosis and whether patients cared for in DiGP practices had better glycaemic control (lower HbA1c) at the time of diagnosis than patients attending non-DiGP practices.

Methods: 22 General Practices from the South West of Ireland were recruited over a 6 week period, including 15 DiGP practices and 7 non-DiGP practices. A random selection of T2DM patients (N=460) were selected and their records were analysed. Demographics, smoking status, BMI (Body Mass Index) and HbA1c values at the time of initial diagnosis were recorded.

Results: Smoking status was recorded for 41% of patients, with 38% reported as current or ex-smokers and 62% reported as non-smokers. BMI was recorded in 47% of patients, with 10% of patient "underweight" or "normal" and 28% "overweight" and 63% considered "obese". There was a significant negative correlation between HbA1c at initial diagnosis and patient age ($r=-0.203$, $p=0.00$). There was a significant correlation between HbA1c at initial diagnosis and positive smoking status ($r=0.204$, $p=0.005$). There was no significant correlation between HbA1c at diagnosis and either BMI or DiGP membership.

Conclusion: HbA1c level at initial diagnosis is higher in younger adults diagnosed with T2DM. This highlights the need for increased diagnostic suspicion in this patient group. Positive smoking status is associated with higher HbA1c level at initial diagnosis, highlighting the need for increased awareness of T2DM in smokers. Membership of DiGP did not lead to earlier diagnosis of T2DM.

Gender differences in glycemic control among patients with diabetes mellitus

Larisa Gavran¹, Subhija Prasko¹, Olivera Batić Mujanović², Alma Alić¹, Ibrahim Gledo¹, Alen Omanović¹, Enisa Ramić², Esad Alimanović³

¹Family Medicine Teaching Centre Zenica, Primary Health Center Zenica, Bosnia and Herzegovina

²Family Medicine Teaching Centre Tuzla, Primary Health Center Tuzla, Bosnia and Herzegovina

³Primary Health Center Kalesija, Bosnia and Herzegovina

Background Many studies have shown that good glycemic control significantly reduces the risk of many complications of diabetes.

Aim of this study was to show how well our patients with diabetes mellitus approached the target values of glycemic control by gender.

Method For Four different groups of patient's members of the local Association of Citizens against diabetes in Zenica we organize one day training (from September to December 2014.) which aim was to educate them about the importance of proper nutrition as a first step in the treatment of diabetes. Before each session for all them body weight, body height, BMI, waist circumference (WC), postprandial blood glucose and HbA1c were measured. **Results** We educated 161 patients with diabetes, 59 (37%) men and 102 (63%) of women aged 10-88 years. BMI > 25 male compared to female had 42 (71%) vs. 70 (68%). WC ≥ 102 cm had 38 (34%) male and WC ≥ 88 cm had 80 (78%) female patients. Postprandial blood glucose > 10 mmol / L had 18 (32%) male patients compared to 29 (33%) female. HbA1c > 7% were 26 (44%) male patients compared to 44 (43%) female.

Conclusion This study shows a significant incidence of obesity in females and a high percentage of patients with poor glycemic control in both genders. We need more effective interventions in family medicine: advice on lifestyle changes and therapeutic treatments in order to offset the development of diabetic complications.

Keywords: education, glycemic control, gender

P-0016**Seasonal Variation in Clinical Remission of Primary Care Patients with Depression: Impact of Gender**Yusuf Cetin Doganer¹, Kurt B. Angstman², Tara K. Kaufman², James E. Rohrer²¹Department of Family Medicine, Turkish Military Academy, Primary Care Examination Center, Ankara, Turkey²Department of Family Medicine, Mayo Clinic, Rochester, Minnesota, USA

Background & AIM: The impact of seasonal variation on clinical remission in patients with depression has not been well studied. The hypothesis for this study was that the clinical remission rate would be lower in the winter comparing to the other seasons, specifically evaluated by gender.

METHOD: The study cohort comprised 2873 primary care patients with depression as a longitudinal retrospective chart review analysis. The sample was limited to patients who were continuing in care; drop outs were excluded from the analysis.

RESULTS: Multivariate logistic regression analysis of the independent variables for those participants who achieved clinical remission demonstrated that for the male patients, the season of diagnosis did not impact the rate of remission at six months while controlling for all other independent variables. For female patients, those that were diagnosed with depression in the fall had increased likelihood of six month remission compared to those patients diagnosed in the winter months (OR 1.300, CI 1.006-1.680, p=0.045) and the spring and summer patients were not significantly different in their outcome rates. When both genders were combined, the odds of remission at six months were not statistically significant for any season of diagnosis.

CONCLUSIONS: This study demonstrates that in patients who were continuing care, women who were diagnosed with major depression or dysthymia in the fall season have improved six month clinical outcome of remission compared to those women diagnosed in the winter, when controlling for demographic and clinical characteristics. This effect was not seen in men or when the genders were combined into a single cohort. The assessment of the seasonality effect on depression outcomes requires further long-term follow-up studies.

Treatment of a non-adherent patient with HIV/AIDS in a Primary Health Care setting in Brazil: a case report

Bernardo Lago Alves, Thadeu Felix Cariello, Marcele Paiva, Regina Ferreira, Rodolfo Deusdará
Department of Integral, Family and Community Medicine, State University of Rio de Janeiro, Rio de Janeiro, Brazil

Background&AIM: HIV/AIDS treatment was, until recently, an infectologists-only field in Brazil. The ongoing improvements in the Brazilian Family Health Strategy, both in coverage and in qualification, has allowed general practitioners to start antiretroviral therapy (ART) and to conduct the care of non-complicated HIV-positive patients. Additionally, it has turned The Family Health Teams (FHT) into the prime actors for accessing and managing care of non-adherent HIV/AIDS patients. This presentation aims at describing one of such cases, the methods used and the many challenges that arised during this process.

Description&RESULTS: A 37-year-old patient complains to a community health worker of progressive weight loss and limb weakness. He refuses to go to the Family Medicine surgery, requesting a home visit by the doctor instead. During the visits, it is found that the he's HIV-positive, with multiple treatment drop-outs due to him being a former drug dealer, therefore not wishing to be seen in his current "sickly, useless" appearance by

neighbours which once feared him. The attending FHT decides to manage his case in the home setting, whenever possible, and with daily supervised administration of medication. While in the process of working out his adherence to the new ART scheme, the patient starts presenting multiple complications from opportunistic infections requiring referrals to emergency departments, where he's usually mistreated and counter-referred without adequate diagnostic investigation. After 1 year of treatment with the current FHT, he dies of pneumonia. **DISCUSSION:** The case illustrates how a patient-centered approach, flexible access and integral care (some of the cornerstones of efficient Primary Care) are vital for handling a patient with a chronic and potentially fatal disease. It also points out fragile knots in the current Brazilian public health network, especially weak integration with focal specialists, subpar emergency services and difficulties in obtaining adequate care for patients requiring hospitalization.

Keywords: HIV/AIDS in Brazil, HIV/AIDS in Primary Care, Brazilian Health System, Brazilian Family Health Strategy

Smoking cessation in patients with Chronic Obstructive Pulmonary Disease

Rosario Martinez Fuerte¹, Leticia Sierra Martinez¹, Natalia Sanz Gonzalez²

¹Valladolid Este Primary Assistance Gerency, Valladolid, Spain

²JCyL Primary Assistance Gerency, Valladolid, Spain

OBJECTIVE: Evaluating patients with COPD who take more than six months without smoking to boost the Quality of Clinical Practice Portfolio Services Primary Care community of Castile and Leon (SPAIN)

METHOD: The authors performed a descriptive cross-sectional study of patients with COPD and Smoking carrying more than six months without smoking, recorded in the medical record computer from the health center.

systematized were randomly selected 96 patients, to whom the record level of compliance was assessed in the clinical history information of healthcare activity: carry more than six months without smoking.

RESULTS: Of the 96 patients studied: 12 present record take more than six months without smoking and 84 are not registered. Representing a percentage of 12.5% of positive records.

In the population studied, the percentage of patients with smoking by age:

85-95years:4%

75-85years:9%

65-75years.14%

55-65years26%

45-55years:26%

35-45years:10.4%

25-35years:6%

15-25years:2%

Smoking among patients who take more than six months without smoking, we find the following distribution:

-85-95years:8.3%

-75-85years:8.3%

-65-75years:0%

-55-65years 41.6%

-45-55years:8.3%

-35-45years:25%

-25-35years:8.3%

CONCLUSIONS: Poor patient registry that carry more than six months without smoking. The percentage of smokers is higher in the age group between 45 and 65, which is 52%. Among smokers with registration carry more than six months without smoking, the highest percentage is found in the town ce 55 -65 years (41.6%), there is no record of having kicked the habit in children under 25 years. From these data we propose a **IMPROVEMENT PLAN IN CLINICAL PRACTICE** usual activities including primary care consultation registration classification and determination of abandonment phase in which the smoker (Pre-contemplation, contemplation or preparation is), appropriate treatment will be offered depending on the stage, and 2-up visits were conducted in smokers who have stopped smoking. This recorded in computer history.

Keywords: COPD, tobacco use, smoking cessation

Atherogenic dyslipidemia and residual vascular risk

Esad Alibasic¹, Farid Ljuca², Olivera Batic Mujanovic³, Enisa Ramic³, Emir Alibasic⁴, Ahmet Tuzlak¹

¹Department of Family Medicine, Primary Health Care Center Kalesija, Bosnia and Herzegovina

²Department of Physiology, Faculty of Medicine, University of Tuzla, Tuzla, Bosnia and Herzegovina

³Department of Family Medicine, Primary Health Care Center and Polyclinics Dr Mustafa Sehović, Tuzla, Bosnia and Herzegovina

⁴Medical Faculty, University of Tuzla, Bosnia and Herzegovina

INTRODUCTION: Atherogenic dyslipidemia is an important factor in the development of macrovascular residual risk and is characterized by the reduced value of High-density lipoprotein (HDL) cholesterol and elevated triglycerides (TG). The residual vascular risk is an significant residual risk in development of macro and microvascular complications and is significantly associated with elevated TG and reduced HDL cholesterol.

CASE: Patient, 53 year old, suffering from type 2 diabetes, metabolic syndrome and arthritis urica, monitored by an outpatient clinic due to pathological findings in lipidogram, that were discovered during preventive laboratory testing, and showed a combined dyslipidemia: TG 4.1 mmol/L, cholesterol 7.4 mmol/L, Low density lipoproteins (LDL) 6.6 mmol/L, HDL 0.7 mmol/L. The status of the patient: abdominal-type obesity, typical xanthomatous changes visible on his eyelids. The therapy included Atorvastatin in dose of 40 mg, together with recommendation for lifestyle modification. Two months later, lab tests showed results as follows: TG 3.1 mmol/L, cholesterol 5.2 mmol/L, LDL 2.9 mmol/L, HDL 0.8 mmol/L. Then, Fenofibrate 250 mg, Rosuvastatin 20 mg and omega-3 fatty acids were included in therapy. After two months, the new lab tests were performed with following **RESULTS:** TG 1.8 mmol/L, cholesterol 4.3 mmol/L, LDL 2.5 mmol/L, HDL 1.5 mmol/L.

DISCUSSION: Numerous studies (PROCAM, PROVE IT-TIMI 22, TNT) have shown that elevated TG and decreased HDL cholesterol were independent cardiovascular risk factors, not depending on LDL cholesterol levels. Large prospective studies indicate that microvascular residual risk could be reduced using fibrates and that omega-3 fatty acids reduce macrovascular risk. Combined hypolipemic therapy resulted in a significant improvement in lipid profile in this patient.

CONCLUSION: Treatment with statins insufficiently reduces vascular risk attributed to elevated TG and reduced HDL cholesterol. Lifestyle modification, together with adding fibrates and omega-3 fatty acids to statin therapy showed improvement in the regulation of lipid parameters.

Keywords: atherogenic dyslipidemia, residual vascular risk, lifestyle modification, statins, fibrates, omega-3 fatty acids

An Unusual Cause of Acute Chest Pain: Rib and Scapula Fracture Due to Cough

Hale ATEŞ¹, Ihsan Ateş², Bülent Bozkurt¹, Tarık Eren Yılmaz³, Adem Özkara³

¹Turgut Özal University, Department of chest disease, Ankara

²Ankara Numune Education and Research Hospital, Department of Internal Medicine, Ankara

³Ankara Numune Education and Research Hospital, Department of Family Medicine, Ankara

Cough is one of the most common symptoms of patients that seeking for medical help. Cough usually recovers without sequelae, but serious cough sometimes leads to complications such as pneumothorax and rib fractures. Fractures often occur after repeated mechanical stress due to chronic cough. In the literature, although chronic cough induced rib fractures are often cited, coexistence of rib and scapular fractures is mentioned rarely. In this case report, left scapula and left eighth rib fracture presenting with acute-onset chest pain presenting is going to be presented.

Ethylene glycol (EG) poisoning can result in serious morbidity and mortality. It is used in construction of glass cleaners and antifreeze solution. EG rapidly absorbs after oral administration and peaks in the blood within 1-4 hours, its half-life is 3-5 hours.

When EG is drunk accidentally or with a suicide attempt, it is transformed into its active metabolites, and then metabolic acidosis, renal failure, hypocalcemia, oksalüri, central nervous system disorders and cardiovascular failure occur. Kidney failure is formed due to double crushing oxalate crystals, one of EG metabolites, accumulation in the distal tubule and collecting duct. We present a case with acute renal failure, metabolic acidosis, coma after drinking antifreeze accidentally.

Newly Diagnosed Primary Hypothyroidism Applicant With Massive Pericardial Effusion And Acute Renal Failure

Ihsan ATEŞ¹, Mustafa Kaplan¹, Nisbet Yılmaz¹, Tarık Eren Yılmaz², Adem Özkara²

¹Ankara Numune Education and Research Hospital, Department of Internal Medicine, Ankara

²Ankara Numune Education and Research Hospital, Department of Family Medicine, Ankara

Pericardial effusion (PE) seen in patients with hypothyroidism is associated with the severity of the disease. While PE is commonly seen in patients with myxedema coma and severe hypothyroidism, it is very rare condition (3-6 %) in patients with moderate hypothyroidism. Primary hypothyroidism resulting with acute renal failure is a rarely diagnosed condition. Although co-existence of ARF due to rhabdomyolysis and hypothyroidism is present in the literature, we did not encounter too many hypothyroidism cases associated with acute renal failure of unknown cause. In this case report, primary hypothyroidism case presenting with massive PE and ARF association which have not seen previously in the literature will be discussed.

Keywords: Acute renal failure, Pericardial effusion, Primary hypothyroidism

Metabolic syndrome in type 1 diabetic patients with microalbuminuria levels

Burcu Dogan¹, Can Oner², Guneş Feyizoglu³, Nurdan Yoruk³, Aytekin Oguz⁴

¹Family Medicine Clinic, Sakarya Training and Research Hospital, Sakarya, Turkey

²Department of Family Medicine, Bilim University, Istanbul, Turkey

³Diabetes Nursing Department of Internal Medicine, Istanbul Medeniyet University Goztepe Training and Research Hospital, Istanbul, Turkey

⁴Department of Internal Medicine, Istanbul Medeniyet University Goztepe Training and Research Hospital, Istanbul, Turkey

INTRODUCTION: Metabolic syndrome is one of the main factors for development of diabetes mellitus and cardiovascular diseases. It was shown that early stage renal injury was developed in cases with metabolic syndrome. The aim of this study was to understand the role of metabolic syndrome in type 1 diabetic patients in urinary albumin excretion.

METHOD: Study was conducted between 01.02.2013-01.05.2013 from patient records of Istanbul Medeniyet

University Goztepe Training and Research Hospital Diabetes Clinic. Metabolic Syndrome was diagnosed as presence of at least 2 criteria below other than diabetes: waist circumference exceeds 94 cm in male and 80 cm in females, blood pressure above 130 mm systolic and 85 mm Hg diastolic pressure, triglycerid level exceed 150 mg/dl or hypertriglycemia treatment or HDL levels lower than 40 mg/dl for men or 50 mg/dl for women. The cohort composed of 262 type 1 diabetic patients (141 males and 121 females) attending the diabetes outpatient clinic. Mean age was 36,4±10,9 year (range: 17-74). All of the data were obtained from patients records. Data analyzed by SPSS 17.0. Comparisons between different groups were performed by unpaired t tests. Comparisons across categories were made using χ^2 . Correlations between variables of interest were performed by Pearson correlation.

RESULTS:

19,1 % (n=50) patients have metabolic syndrome. On the other hand 88,9% (n=233) patients have normal urine sample (<30 mcg mg/ creatinine), 8,7% (n=23) have microalbuminuria (30-300 mcg mg/ creatinine) and 2,4% (n=6) have albuminuria (>300 mcg mg/ creatinine). 24,1% (n=7) of patients with albuminuria have metabolic syndrome where as 18,4 % (n=43) of non-albuminuric patients have metabolic syndrome (p= 0,457).

CONCLUSION:

Our results showed that urinary albumin excretion was not elevated in type 1 diabetics with metabolic syndrome.

Keywords: Metabolic syndrome, type 1 diabetic patient, microalbuminuria

Triglyceride/high-density lipoprotein cholesterol ratio and albuminuria in adult type 1 diabetics

Burcu Dogan¹, Can Oner², Aytakin Oguz³

¹Family Medicine Clinic, Sakarya Training and Research Hospital, Sakarya, Turkey

²Department of Family Medicine, Bilim University, Istanbul, Turkey

³Department of Internal Medicine, Istanbul Medeniyet University Goztepe Training and Research Hospital, Istanbul, Turkey

OBJECTIVES: Micro and macro vascular complications are common in diabetes. Lipid profile has also an important role in development of atherogenic vascular changes. Recent studies reveals that small LDL particles are more atherogenic than larger ones has determinative in atherogenesis. Serum triglycerides to HDL cholesterol ratio (TG/HDL) and small dense LDL negatively correlates. The aim of this study was to evaluate the effect TG/HDL on diabetic nephropathy in adult type 1 diabetics.

METHODS: Our study was carried out retrospectively in Istanbul Medeniyet University Göztepe Training and Educational Hospital between 2012-2013. The cohort composed of 248 type 1 diabetic patients (128 males and 120 females) attending the diabetes outpatient clinic. Mean age was 37,4±11,0 year (range: 17-74). LDL cholesterol, HDL cholesterol, TG levels, and urinary albumin levels were obtained from patients records. Statin user type 1 diabetics are excluded from the study. Data analyzed by SPSS 17.0. Comparisons between different groups were performed by unpaired t tests. Comparisons across categories were made using χ^2 . Correlations between variables of interest were performed by Pearson correlation.

RESULTS: There were 39 (15,7%) patients with albuminuria. Mean HDL cholesterol level was 56,62±32,54 mg/dl in normoalbuminuric patients and 51,61±12,69 mg/dl in albuminuric patients (p=0,345). On the other hand mean triglycerid levels were 106,44±86,19 mg/dl and 127,94±88,47 mg/dl in two groups respectively (p=0,156). The level of microalbuminuria and ratio was positively correlated (r=0,22; p=0,000). But the mean TG/HDL ratios of two groups do not show significant difference (2,76 vs 2,20; p=0,150).

CONCLUSION: This study showed that TG/HDL ratio do not show significant difference between albuminuria and normal albuminuria groups but the ratio positively correlated microalbuminuria levels.

Antidiabetic treatment in a cohort of primary care patients along 7 years

Francisca Rivera Casares, Sebastián García De León Chocano, Pilar Collar Pastor, Adela Briones Través, Silvia Pérez López, Almudena Blanes Monllor
Centro de Salud Fuensanta (Valencia)

Background

In recent years new treatments have been commercialized and therapeutic recommendations have been modified, changing the therapeutic profile of diabetics.

Aim

We intend to evaluate the changes in the treatment of a cohort of diabetic patients treated in a Health Center.

Method

We selected a representative sample of diabetics treated in 2010 and monitored over 7 years (3 years retrospectively and 4 prospectively, from 2007 to 2013) the drugs used, through the prescribing application of the electronic history.

Results

We included 316 cases with mean age of 72.6 years and 54.1% female.

The use of metformin changed from 48.4% to 65.4% of patients, sulfonylureas from 17.3% to 13.1%, glitazones from 1.6% to 2.1%, meglitinides from 13.7% to 16.9%, incretins from 1.3% to 38.4%, inhibitors of alpha-glucosidase from 8.2% to 2.5%, analogs of GLP-1 from 0% to 1.7%, NPH or mixed insuline from 19.9% to 15.6%, lente insuline from 5.9% to 19.8%, and fast insuline from 3.9% to 7.6%. No other antidiabetic drug was used. The proportion of patients without drug treatment in the cohort passed from 25.6% to 5.9%. The number of antidiabetic drugs increased from 1.2 to 1.8 per year ($p < 0.0001$). The number of drug changes performed remained almost constant at around 0.71 per year.

The use of antihypertensive drugs increased from 69.0% to 79.3%, hypolipemiant from 51.3% to 73.0%, and antiplatelet/anticoagulants from 25.7% to 33.8%.

Conclusions

With increasing age and years of evolution of diabetes, the use of insulin, metformin and incretins has increased, as the number of drugs per patient. The use of other cardiovascular risk factors has also increased.

7-year follow-up of a cohort of diabetics in a Health Center

Francisca Rivera Casares, Sebastián García De León Chocano, Pilar Collar Pastor, Adela Briones Través, Silvia Pérez López, Almudena Blanes Monllor
Centro de Salud Fuensanta (Valencia)

Background

It's challenging to reach an acceptable degree of metabolic control and cardiovascular risk factors in diabetics despite improved control processes.

Aim

To monitor long-term control processes performed in a Health Center, and results obtained.

Method

We selected a representative sample of diabetics in 2010 and tracked over 7 years (3 years retrospectively and 4 prospectively, 2007-2013) the process of care variables (consultations and tests) and results (blood pressure, LDL-cholesterol and HbA1c), development of target organ diseases and mortality.

Results

We included 316 cases with mean age of 72.6 years, 54.1% female.

The standard of one follow-up visit per year by the primary care doctor changed from 80.7% of patients up to 89.9%, 4 visits by nurse from 33.7% to 37.0%. Biannual eye fundus was performed to 37.0%. The completion of at least one annual lipid profile changed from 67.4% to 81.9%, one annual screening for renal function from 63.8% to 84.8%, and one annual HbA1c from 58.3% to 79.3%.

Patients with blood pressure below 140/80 mmHg changed from 56% to 64%, LDL-cholesterol below 100 mg/dl from 30% to 63%, and HbA1c less than 7%, from 62% to 54%.

58% of patients were smokers and an additional 7% stopped smoking. 52% were obese and an additional 15% came to be, while 16% had normal weight and an additional 14% went on to have it.

14% had ischemic heart disease at baseline and 6% was developed, 5% peripheral arterial disease and 4% developed, 8% diabetic retinopathy and 14% developed, 6% nephropathy and 21% developed. Mortality rate at 7 years was 22.8%.

Conclusions

The improvement of control processes of diabetes continues to an improvement of control parameters except for HbA1c. It is necessary to assess the impact of process control in the degree of improvement in results, and the latter on comorbidity.

The Evaluation Of Metabolic Syndrome Frequency and Its Components In Newly Diagnosed Type-2 Diabetic Patients

Muhammet Oktay¹, Gulseren Oktay², Yusuf Haydar Ertekin³, Cemil Isik Sonmez⁴, Feruze Turan Sonmez⁵

¹Baglar Family Health Center, Tokat, Turkey

²Department of Family Medicine, Gaziosmanpasa University, Tokat, Turkey

³Department of Family Medicine, Canakkale Onsekiz Mart University, Canakkale, Turkey

⁴Department of Family Medicine, Duzce University, Duzce, Turkey

⁵Department of Emergency Medicine, Duzce University, Duzce, Turkey

BACKGROUND & AIM: We planned this study in order to identify the relationship between metabolic syndrome and its components and the frequency of it in untreated type- 2 DM patients and in patients with new diagnosis type 2- DM.

METHOD: In the study, 220 diabetic patients were questioned on weight, height, waist circumference, body mass index, fasting blood glucose, blood pressure, HbA1c, total cholesterol, triglycerides, LDL, HDL data, in addition to the components of metabolic syndrome in first-degree relatives.

RESULTS: In our study on new diagnosed type-2 diabetic patients, the frequency of metabolic syndrome (MS) was found 70.5%, according to National Cholesterol Education Program (NCEP), and 80% according to the International Diabetes Federation (IDF). The rates of MS by gender in women and men was 84.8% and 75.6%, respectively. Obesity was found as the most frequent MS component in all the first-degree relatives of the patients; parents, sisters, brothers and children.

CONCLUSIONS: Waist circumference was found to be the best reflecting criteria of insulin resistance. According to the NCEP criteria, no significant difference was found in fasting blood glucose levels in MS and non MS patients. The reason for this was thought to be the fact that NCEP kept fasting blood glucose threshold value low, in order to reduce the long-term risks. The entity that obesity was found in all the first-degree relatives of the diabetic patients aroused the suspicion that obesity disease may be transferred with the same genes with diabetes and insulin resistance.

Keywords: Diabetes, insulin resistance, metabolic syndrome, obesity

Management of female patients with Osteoporosis in Primary Health Care

Martha Andreou¹, Valentine Dislian¹, Marianna Petra²

¹Health Centre of Avdira, Xanthi, Greece

²Orthopedic Surgeon, Athens, Greece

BACKGROUND & AIM: The purpose was to study the female patients diagnosed with osteoporosis (dexa, x-rays) and treated by a General Practitioner (G. P.) with the support of an orthopedic surgeon

METHOD: We recorded in three years the number of female patients who received treatment against osteoporosis, their age, the pharmaceutical substance, the complications (hip and vertebral fractures), DEXA results (begin and after 2 years) and the compliance

RESULTS: a) totally 132 female patients were recorded, with an average age of 60,96± 6,50 years, b) 61 women (46,2%) received alendronate, 35 women (26,5%) ibandronic acid, 24 women (18,2%) risedronate and 12 women (9,1%) denosumab, c) All of them received calcium and 85 (64,4%) alfacalcidol, d) 104 women (78,8%) received treatment as recommended, e) as complications were recorded 3 hip fractures (2,3%) and 10 vertebral fractures (7,6%), f) about the t-score in DEXA at first was -3,091 ± 0,3765 (-4,2 until -2,5) and after two years -2,616 ± 0,3629 (-3,9 until -2,0)

CONCLUSIONS: a) the majority of the sampled women received bisphosphonates (90.1%) and Calcium pills. b) the majority of the sampled women showed good compliance that reached 100% for those who were treated with denosumab c) Complications were consistent with the literature, d) The majority of women showed a statistically significant improvement after two years of treatment with better results in patients who received denosumab (p<0,05) e) Our results demonstrate that the GP can offer an effective primary care to the female patients with osteoporosis when he has been trained and supported from the experts.

"A still-photograph of diabetes and its knowledge in a rural area"

Jose Antonio PASCUAL Lopez, Pedro María Martínez López, Concepción Martinez Delgado, Alfredo Pérez Carrillo, María Ros Marín, Javier Aracil Fernández, Juana Noelia López Pastor, María Huertas Vidal Gimenez, Francisco Javier Fernández Valero, Noelia Benítez Samuel, Miguel Angel Asmat Segura, Andres Egea Huertas
Centro de Salud de Calasparra. Gerencia del Noroeste. Servicio Murciano de salud. Murcia. Spain.

- Background & AIM: To determine the profile of our diabetic population, control and knowledge of the disease:
- METHOD: Quality assurance methodology. Rural Field. Simple random sampling. We collect biographical data and metabolic control as ADA criteria 2009 and we appreciate their understanding of the disease using a validated test, the adherence to treatment by Morinsky-Green test, the family support and the belonging to a diabetes group.
- RESULTS: 17% of diabetics are under 35 years old and 38% over 70. 64.8% have basic studies and only 4% university studies. 52.1% is male there is no significant difference. Almost 60% of diabetics have less than 10 years of evolution. Metabolic Control (ADA 2009). "A" (fasting glucose) 46.47%, "B" (A + glycohemoglobin) 40.86%, "C" (B + systolic blood pressure) 32.39%, "D" (C + diastolic blood pressure) 29.3%, "E" (D + LDL-cholesterol) 18.31% and "F" (E + Non smoking habit) 16.9%. 74.65% of patients had not presented symptomatic hypoglycemia with a confirmed blood glucose over the last year. Knowledge of the disease: 38% Inappropriate (0-13 / 26), 29.6 Intermediate (14-19 / 26), 32.4 Appropriate (20-26 / 26). 84.5% had family support, 77.5% had a good adherence (Morinsky-Green) and only 5.6% belongs to a group of diabetics.
- CONCLUSIONS: The biographical profile of diabetic patients and their metabolic control in our environment are similar to that found in other studies, with small differences have no statistical significance. There is a very low degree of membership diabetes group. The existence of family support is similar to studies of rural areas. There is a high therapeutic adherence. The percentage of patients without hypoglycemia is low, relative to the use of fewer hypoglycemic antidiabetic.

Background&AIM: In our country, the control of most of the patients with AF and anti-coagulation using anti-vitamin K drugs, is carried out in primary care, with portable coagulometers on capillary blood. This results in a large number of visits to physicians and nurses. Our aim is to find out the factors associated with a high number a capillary check-ups.

METHOD: Retrospective study of the visits made by anticoagulated patients for AF treated with anti-vitamin K under the supervision of the physician in primary care. Data obtained from computerized medical records and from the hematology laboratory referenced over the period of one year.

Results. We obtained a sample of 201 patients; 141 over the age of 75(70.1%), and an similar number of men and women. 98.7% were taking acenocumarol as anticoagulant. The average number of check-ups per year was (12.21±3.27); more if the patient was immobile(14,02±4,35 Vs 11,62±2,57 p<0,05), which means that 52% of patients whose check-ups took place at home had more than 12 check-ups per year, compared to 32.5% for those who attended the medical centre. Those patients over the age of 75 also required a higher number of check-ups (12.74 ±3.31 Vs 10.97±2.84 p<0.05), and those whose INR was more unstable (13.27±4.17 Vs 11.81±2.66 p<0,05). There were no significant differences in the number of visits with regards to gender or to the degree of control.

CONCLUSIONS: Patients with capillary INR check-ups need to be seen by a doctor or nurse more than once a month on average. This number of check-ups is higher if the patient is unable to leave their house, if they are older or if their INR is more unstable. However, we have not found differences when the INR is controlled less, possibly due to a certain degree of inertia despite the poor control.

⁴Department of Emergency Medicine, President Guard Regiment, Ankara, Turkey

INTRODUCTION: Lichen nitidus (LN) is a relatively rare, chronic skin eruption that is characterized clinically by asymptomatic, flat-topped, skin-colored micropapules located on the chest, abdomen, penis glans and upper extremities. It usually presents with limited involvement; however, it can present as generalized involvement. LN mainly affects children and young adults. LN is usually an asymptomatic eruption; however, patients occasionally complain of pruritus. Familial cases have been described. The cause of LN is unknown. Controversy exists regarding the relationship between lichen planus and LN.

CASE: Herein we report the case of a 48-year-old woman who developed generalized LN. The patient came to our outpatient clinic complaining of a rash and pruritus on her body. Her dermatological examination showed bright, diffuse follicular papular lesions which were skin-colored or partially light pink in color. They were 1-2 mm in diameter and distributed on her body and back as well as her arms and legs. Nail and oral mucosal examinations were normal. A punch biopsy sample was taken from a papule on the leg. The patient was diagnosed with LN. The case of generalized lichen nitidus successfully treated with low dose acitretin (20mg). The lesions completely regressed with post-inflammatory hyperpigmentation on the one month of the therapy. We believe that acitretin is an effective treatment on generalized LN.

CONCLUSION: No therapeutic modality has been rigorously evaluated for the treatment of LN because of the rarity, lack of significant symptomatology, and disappearance of this disease within one or several years. Reported therapies, mostly from isolated case reports, include topical and systemic steroids, topical tacrolimus, systemic cetirizine, levamisole, etretinate, acitretin, itraconazole, cyclosporine, topical dinitrochlorobenzene, psoralen plus UV-A light, and narrow-band UV-B light. LN may remain active for several years; however, spontaneous resolution usually occurs.

"Degree of control and knowledge in Diabetes type 2. Comparison between rural and urban populations"

Jose Antonio Pascual Lopez¹, Pedro María Martínez López¹, Javier Aracil Fernández¹, Alfredo Pérez Carrillo¹, Concepción Martínez Delgado¹, María Ros Marín¹, María Dolores Vazquez García², María Huertas Vidal Gimenez¹, Francisco Javier Fernández Valero¹, Noelia Benítez Samuel¹, Mónica Arcos Rivera¹, José Alcibiades Durán Aaron¹

¹Centro de Salud de Calasparra. Gerencia del Noroeste. Servicio Murciano de salud. Murcia. Spain.

²Centro de Salud Barrio del Progreso. Gerencia Area VII. Servicio Murciano de Salud. Murcia. Spain.

- **Background & AIM:** To determine the importance of the control of diabetes and knowledge of the disease in the diabetic population.
- **METHOD:** Quality assurance methodology. Rural Field. Simple random sampling. We collected biographical data (sex, age, educational background and years of evolution), clinical and analytical data, knowledge of the disease using a validated test, adherence to treatment by Morinsky-Green test, family support and group membership diabetes. G-Stat statistical software. Chi-square and Fisher Test.
- **RESULTS:** Knowledge of the disease: Intermediate or appropriate 59.7% (rural) 83.3% (urban). Presence of hypoglycemia: 28.9% (rural) 8.3% (urban). Metabolic Control (ADA 2009 criteria) small non-significant difference. If we value only glycemic control (fasting glucose and HbA1c) is 36.6% (rural) and 65% (urban). Family support: 81% (rural) 100% (urban). Adherence to treatment: 83% (rural) 51% (urban). The rest of measurements studied: group members diabetes, systolic and diastolic blood pressure, LDL-cholesterol or smoking have a homogeneous distribution in both groups.
- **CONCLUSIONS:** There is a much higher percentage of diabetics with a suitable intermediate knowledge of the disease in urban areas, although a very little difference, it does not become significant, probably due to the sample size, nor is there a difference in family support. The differences in hypoglycemia, glycemic control, and adherence to treatment are statistically significant and the first two could be related to a better understanding of the disease in urban areas as we have already seen.

Chronic diseases and malnutrition

M Rosario Hernandez Ibañez¹, Natividad Martin Peña¹, Gemma Saez Rubio¹, Alicia Coiduras Charles¹, Carmen Acebron Sanchez Fortun¹, Núria Fabrellas²

¹CAP La Marina. ICS. Barcelona. Catalonia

²Universitat de Barcelona. IDIBELL. Barcelona. Catalonia

INTRODUCTION: The incidence of chronic diseases has increased in recent decades. The main causes are the increasing age of the population and unhealthy habits, such as smoking and alcohol consumption. Heart failure (HF) and Chronic Obstructive Pulmonary Disease (COPD) are major public health problems, because they cause a high morbidity and mortality in the general population. The cardiovascular disease prevention is based on a healthy diet. Healthy diet is part of the treatment of chronic diseases in order to avoid malnutrition. Malnutrition in these patients increases the risk of mortality.

AIM: To assess nutritional status in patients with HF and/or COPD attending an urban primary health care center.

Population:

Cross sectional study of patients with HF and/or COPD conducted during 2014.

Participation was voluntary and a diagnosis of HF and / or COPD during the study had to be registered in the medical record of the patients. Patients with severe mental disorders and other severe conditions in the terminal phase were excluded. A MiniNutritional Assessment test was performed in all patients.

FINDINGS: One hundred and ninety-two patients participated in the study, 77 with HF, 88 with COPD, and 27 with both. Fifty-nine percent of patients were male and 41% female. Average age was 77.6 years (range:46-96).

Overall, 32 of the 192 patients (17%) were malnourished or were at risk of malnutrition. Overall, men had a higher percentage of malnutrition compared to women (20.2% vs. 11.5%). Among the different conditions, the greatest prevalence of malnutrition was observed in patients with HF and COPD (30%), while patients with HF or COPD alone had lower risk (17% and 11%).

CONCLUSIONS: Men have greater risk of malnutrition compared to women. Malnutrition is frequent among patients with HF and/or COPD. Patients with the greatest risk of malnutrition were those suffering from HF associated with COPD.

Adherence to anti-diabetic medications in Port Saied, Egypt

Taghreed Mohamed Farahat, Nagwa Nashat Hegazy

Department of family medicine; Faculty of medicine, Menofia university

BACKGROUND: Diabetes is the eleventh most important cause of premature mortality in Egypt, and is responsible for 2.4% of all years of life lost (YLL). Similarly, DM is the sixth most important cause of disability burden in Egypt Thus improvement of patient adherence will decline these figures

OBJECTIVES: assess the diabetic patient's adherence to medication and primary health care factors obscuring their adherence.

METHODS: Patients with type 2 DM were recruited at Port Said family health outpatient clinics, Egypt using a convenient sampling technique (150 participants). All the participants were interviewed using Morisky Medication Adherence Scale (MMAS) followed by a semi-structured questionnaire for service obstacles in the primary health care according to the quality standards.

RESULTS: 150 diabetic patients participated in the study most of them were low adherent resembling 55.3% of the studied group. Most of the low adherent patients were illiterate and those with insurance. The main services obstacles that were pointed at were long waiting time and short consultation period. There was a statistical significant correlation between adherence score and obstacles score.

CONCLUSION: This study showed that non adherence of the diabetic patients is a fundamental problem. Primary health care services are a corner stone in shaping their adherence.

KNOWLEDGE and EXPERIENCE ABOUT COMPLEMENTARY and ALTERNATIVE MEDICINE OF PATIENTS WITH LOW BACK PAIN IN A PRIVATE HOSPITAL

Nimet Emel Lülecı¹, Ayşe Gülsen Teker¹, Seyhan Hıdırođlu¹, Nurettin Lülecı², Aylin Özkahraman¹, Ayşe Ceren Kaypak¹, Şerife Gözde Şen¹, Ferhat Durup¹, Deniz Tengerek¹

¹Department of Public Health, Marmara University Medicine Faculty, Istanbul, Turkey

²Akkor Sağlık, Istanbul, Turkey

Background and Aim

CAM therapies are emerging in recent years and have been commonly used in many industrialized countries as well. There have been some studies in Turkey about CAM but these studies are limited to certain groups of patients and they are not enough. One of the fields where the CAM treatments are predominantly used is musculoskeletal disorders.

The objective of this study is to get views and experiences related to CAM from patients with low back pain, and to determine patients' level of knowledge about CAM treatments.

Method

In this cross-sectional study, the population consists of 450 patients that visited the pain clinics of a hospital between May and June 2014. And the sample consists of the 250 patients that were selected simple randomly from population. The sample was asked to answer our questionnaire that has 27 questions via telephone. In statistical analysis, the Student's t test, Chi-square test and the Mann-Whitney U test was applied.

Results

62.4 % of participants revealed that they have used CAM previously.

The reputation of the reliability of CAM was 4% very insufficient, 25.2% insufficient, 24% sufficient, 0.8% very sufficient.

45.6% of patient noted that they have no idea about the safety of CAM.

62.4% of the participants think that CAM is effective but sometimes, 27,4% said they found CAM effective, while 10,2% said it is ineffective.

In large of patients learn CAM by advice:

75.2% by advice of a friend and family

18,5% through television or internet

5.1% as a doctor's recommendation.

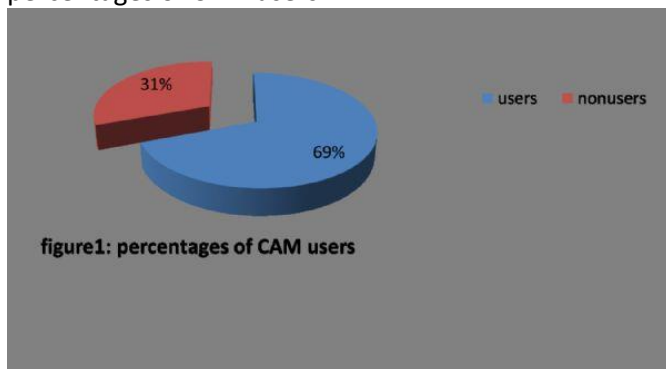

1.3% of patients said they heard CAM from other sources.

Conclusions

This study showed that patients mostly couldn't get information from right resources. The majority of patients have no idea about CAM safety and efficacy. Health workers should do more researches on this topic. And inform patients correctly.

P-0037**Effectiveness of Diabetes Shared Care Program (DSCP) on diabetic outpatients of a local clinic in Taiwan**

Jiachi Tu, Ming Chen Chen, Wen Ruey Yu, Chin Yu Ho

Family Medicine Department, Taipei City Hospital, Yangming Branch, Taipei, Taiwan

Introduction: Diabetes is a rising worldwide problem and increases the risk of morbidity and mortality. "Diabetes Shared Care Program (DSCP)" is a comprehensive care model, consisting of multidisciplinary team members. Some studies have proved that DSCP improves the life quality of chronic care on diabetic outpatients in urban area in Taiwan. However, it was rarely studied in primary care in rural area of Taiwan.

Purpose / Methods

This retrospective study aimed to assess the effectiveness of DSCP in managing with type 2 diabetes in an outpatient clinic in rural area of Taiwan. We invited diabetic outpatients to join the DSCP from 2011 to 2014 in primary clinic and enrolled patients who persistently followed up. Parameters related to diabetes among these patients were inquired. Biochemical data were collected before and after the intervention of DSCP and analyzed with SPSS 12.0 software.

Results: 68 diabetic subjects were enrolled (average age 69.5 years with 36.7 % male and 63.3% female) from a local clinic in Taiwan from 2011 to 2014. We found statistically significant improvement in fasting sugar and HbA1C after 1 year intervention. Fasting sugar decreased from 138.7±33.6 to 137.6±33.6 (P<0.001) and HbA1C improved from 7.3±1.2 to 7.1±1.0 (P<0.001). Furthermore, consistent improvement, which was identified by paired T test (P<0.001), was found after 2 years intervention.

Conclusions/Comments: This research demonstrated the positive results of Diabetes Shared Care Program which practice on type 2 diabetic outpatients in primary care. We suggest Diabetes Shared Care Program, providing comprehensive care, should continually be offered to both urban and rural area of Taiwan.

Does patient centeredness improve health care? A Case report

Abdurrahman Çınar, Oğuz Yılmaz, Azize Dilek Güldal

Department of Family Medicine, Dokuz Eylül University, Izmir, Turkey

Background

Studies show that 72% of the reasons of admission to primary care are chronic diseases. The aim of this case report is to show that better results can be achieved at the management of Type 2 DM by holistic approach.

Case Report

A 43 years old female patient had Type 2 DM for 10 years, receiving insulin therapy for 5 years. She had applied to a hospital with excessive thirst, frequent urination and feeling tired. The results of laboratory tests were fbg:310mg/dl, total cholesterol:412mg/dl, ldl:212mg/dl, hdl:37mg/dl, triglyceride:1450mg/dl, HbA1c.11.9%. She applied to our center because it was hard to get appointment from hospital.

When she applied she was calm and already started to apply her insulin and diet regimen properly. She had been hospitalized 3 times because of BG dysregulation. Recently she was using insulin and fenofibrate. She stopped metformin without consulting a physician. She indicated that she discontinued her medication frequently, although she has information about the DM. Her history was deepened in this direction. The patient expressed that she does not care her disease, feels worthless, nobody cares of her in the family. She lost her sister 2 years ago. The rest of her history and physical examination was normal.

The management of therapy is focused on her social and psychological problems. Patient was encouraged to think and talk about her life situation with her family. Also fluoxetine has been delivered besides regulating antidiabetic therapy. The patient was followed up with regular weekly and then monthly meetings. In follow-up, besides targeted diabetic results, she was feeling very well and stick on her therapy seriously.

Conclusion

The treatment addressing only the medical aspects of blood glucose regulation is inadequate, patient centered clinical method improves health care in primary care.

P-0039

Effect of Lixisenatide on glycosylated hemoglobin and weight in patient with Diabetes type 2 at initial. A case report

Rosa M^a Palacios Fort, Beatriz Soria Navalón

CSI Campello, Department of Health 17 San Juan, Alicante, Spain

Background and AIM:

New treatments for Diabetes type 2 as the glucagon-like peptide-1 receptor agonist (GLP-1) have demonstrated effectiveness in the reduction of postprandial glucose, glycosylated hemoglobin (HbA1c) and weight loss with a low risk of hypoglycemia.

Lixisenatide once daily subcutaneous dosing has shown the above effects and the objective of this study is to verify the data.

METHOD: 72 year-old woman with a history of hypertension, atrial fibrillation, morbid obesity and breast carcinoma, attends primary care consultation by polyuria and polydipsia that has evolved over several months.

Exploration: weight: 91 Kg., size: 150 cm, IMC: 40.4 kg / m²

Analytics: glucose 277 mg/dl, HbA1c 12.3%, ALT 37U/L, glycosuria, other parameters within normal levels.

Starts treatment with Lixisenatide (Lyxumia) 10 µg subcutaneous once daily for 14 days and then follow with Lixisenatide 20 µg once daily subcutaneous, plus metformin 850 mg. every 12 hours, proper diet and exercise for 6 months.

During the treatment the patient has not had any episode of hypoglycaemia or side effects.

RESULTS:

After 6 months the patient has lost 6.5 kg. and Analytics: HbA1c 6.7%, ALT 37, urine microalbumin 425.2 mg/L, albumin/creatinine ratio 369.7 mg/gr, and other parameters within normal levels.

CONCLUSIONS:

Daily subcutaneous Lixisenatide in combination with metformin has proved its effectiveness both in the weight reduction and the decrease of HbA1c, being 5.6 points, with very good tolerability, no side effects nor hypoglycemia during the 6 months of the study. These results may have been so spectacular due to an initial stage of diabetes.

Lixisenatide in combination with oral anti-diabetic therapy significantly improves outcomes combining efficacy and safety in patients with diabetes type 2.

BACKGROUND: Guidelines recommend estimation of glomerular filtration rate (GFR) and albuminuria as routine tests in diabetic patients. Estimated GFR below 60 mL/min/1.73m² is considered as a major cardiovascular risk factor.

AIM: To compare GFR estimated with MDRD and CKD-EPI between diabetic population "vs" non-diabetic of Madrid Health Service.

METHOD: Study design: Case-control, cross-sectional multicenter study conducted in 55 Health Centers of Madrid Health Service (Spain).

Study population: Simple random sampling of the population (168,853 adults) attached to 111 researchers physicians: 8609 subjects. Exclusion criteria: Untraceable or dataless: 21.66%; refused consent: 7.87%; no medical interview: 3.94%; pregnant, immobilized: 3.44%. Study subjects: 5392.

Statistical analysis: Qualitative variables: Percentages with 95% confidence intervals (CI). Chi-square; z-Test.

Quantitative variables: Means with standard deviation (±SD). Differences of means: T-Test after evaluating Levene test.

RESULTS: Mean (±SD) age of the study population was 55.43 (±17.78) years. The percentage of male sex was 43.27% (41.94-44.60).

Prevalence of diabetes mellitus (DM) was 14.84% (13.90-15.81). Prevalence of chronic kidney disease (CKD) was 11.76% (10.91-12.65).

The differences of descriptive variables, prevalences of CKD stages and albuminuria between diabetic "vs" non-diabetic are described in tables 1 and 2.

In diabetic population, GFR mean estimated with MDRD-4 (85.92 mL/min/1.73m²) was slightly but significantly (p < 0.0001) higher than estimated with CKD-EPI (81.99 mL/min/1.73m²). There was no significant differences between prevalences of any CKD stage estimated with MDRD-4 "vs" CKD-EPI (Table 3).

CONCLUSIONS: GFR estimated with MDRD-4 and CKD-EPI are 8 and 13 mL/min/1.73m² respectively lower in diabetic than in non-diabetic.

GFR < 60 mL/min/1.73m² is three times more frequent in diabetic than in non-diabetic.

Prevalence differences in all stages of CKD between diabetic "vs" non-diabetic are significant, except in stage 4 In the diabetic population, there are not significant differences in the prevalence of any CKD stages estimated with CKD-EPI "vs" MDRD-4.

Keywords: Diabetes mellitus; Glomerular filtration rate; Chronic kidney disease.

COPD Screening in Family Medicine

Neda Ferizovic, Amra Lasic, Rasema Sehovic, Elma Merdzanovic, Farida Mehic, Atifa Kulovic
Public Institution Health Centre of Sarajevo Canton, Bosnia and Herzegovina

INTRODUCTION: COPD is "undervalued" because it is not recognized and not diagnosed until it is clinically recognizable and advanced. This disease affects 329 million people(5%) in the world, (WHO, 2013)

OBJECTIVE: To investigate the justification for the use of mini-spirometer (COPD-6) in family medicine for early detection of COPD in younger and middle-aged patients.

METHODS: Epidemiological study of six family medicine teams in the Sarajevo Canton (September - December 2014) on 240 patients (120 smokers and 120 non-smokers) 35 - 65 years of age with no prior diagnosis of COPD. Parameters for the study were: gender, age, smoking status, degree of dyspnea and pulmonary function. Data was obtained through an interview, COPD Assessment Test (CAT) and spirometry done with mini-spirometer (COPD-6) (FEV₁, FEV₆ and FEV₁ / FEV₆).

RESULTS: 240 patients with an average age of 48.04, SD 17.67. Of 142 women, 73 (51.4%) were smokers, and of 98 men 47 (47.9%) were smokers. According to the degree of dyspnea (CAT) 29% of smokers have moderate and severe dyspnea (23M and 12F), while 87% of non-smokers have no symptoms or they are very mild. Obstruction index 1 (50% <FEV₁ <80%) was found in 28.75% of patients (32M, 37F). Index obstruction 1 had 46.6% (25M,31F) of smokers, and 10.8% (7M6F) of non-smoker. According to the GOLD guidelines (50% <FEV₁ <80% and FEV₁ / FEV₆ <0.73) GOLD stage 2 COPD have 17 subjects (7.08%), 16 (10M and 6F) or 13.3% of smokers and 1 (M) non-smoker.

CONCLUSION: Newly discovered 7.08% of COPD patients, younger and middle aged with previously unrecognized diagnosis, justify the need for screening, especially in those with a positive smoking history (13.3% detected). Using mini-spirometer(COPD6) for evidence of airway obstruction family physician can begin early treatment of COPD and, if necessary, refer the patient to the "big" spirometry.

Factors associated with Diabetic nephropathy in patients with Diabetes mellitus type 2 in Community Medical Unit 3 of Buriram hospital

Teeranart Oungsakul, Thanawan Bailee, Siwaporn Boonnontae, Tanapong Ing Ab, Anek Kaewsawat, Chayutra Intrakumhang, Thanaban Sereesongsaeng, Asst.prof. Dr.soraya Kaewpitoon, Dr. Pantipa Sangkarit, Dr. Seekaow Churproong, Thawee Sang Ngam
Department of Medicine, Suranaree university of technology, Nakhonratchasima, Thailand

Diabetic nephropathy is the most famous complication of Diabetic patients in Thailand and lead to renal replacement therapy, included by many factors. This study aimed to study the factors associated with Diabetic nephropathy in patients with Diabetes mellitus type 2.

The cross-sectional descriptive study and analytic study is chosen in the research for assess the factors with effected on diabetic nephropathy (DN). The study was done among 80 diabetes mellitus type 2-clients who came to Community Medical Unit 3 of Buriram hospital between 1st October 2013 and 30th November 2014. There are 65 diabetic nephropathy patients and 15 non-diabetic nephropathy patients.

The result of descriptive study revealed that the Mostly female, mean of age is 62 years, the most comorbidity is hypertension (78.8%), the most drug use is sulfonylurea group, and they have good knowledge, neutral attitude and moderate behavior.

The factors associated DN that we found the statistic significant in univariate analysis are the age less than or equal to 60 year-old, revealed lower chance to turn to DN compared with the age more than 60 years for 0.21 times (OR 0.05 95% CI=0.06-0.74), the male patient is lower chance to turn to DN compared with the female patient about 0.25 times (OR 0.05 95% CI=0.07-0.84), and patient have diabetic disease duration more than 10 years is higher chance to turn to DN than patient have lower 5 years is 8.46 times (OR 8.46 95% CI=1.01-71.10). Moreover, multivariate analysis at the significant level revealed that male patient is lower chance to turn to DN compared with the female patient about 0.13 times (OR 0.13 95% CI=0.02-0.67) and patients who have poor behavior are lower chance to turn to DN compare with patient who have great behavior about 0.03 times (OR 0.03 95% CI=0.01-0.88)

A case group presentation with autoimmune polyglandular syndrome

Burcu Dogan¹, Hasan Ergenc², Nurdan Yörük³, Aytakin Oguz³

¹Family Medicine Clinic, Sakarya Training and Research Hospital, Sakarya, Turkey

²Department of Internal Medicine, Sakarya Training and Research Hospital, Sakarya, Turkey

³Department of Internal Medicine, Istanbul Medeniyet University Goztepe Training and Research Hospital, Istanbul, Turkey

Introduction

This study aim, the Autoimmune Polyglandular Syndrome (APS) determination of frequency in patients with Type 1 Diabetes Mellitus (T1DM).

Method

483 T1DM patients (264 men, mean age 36,73 and 218 women, mean age 35,82) who applied to Istanbul Medeniyet University Göztepe Training and Research Hospital, Diabetes Department between the dates 2009 and 2014 were included in the study. The patients with at least two autoimmune diseases accompanying the diabetes were scanned retrospectively.

Results

11 of the 483 patients had the Celiac Disease (CD) diagnosed with duodenum biopsy. 8 of the patients who were diagnosed with the CD were also diagnosed with Hashimoto Thyroiditis (HT) with one of or both of the Anti TPO and Anti Thyroglobulin positivity. These patients were in the APS Group Type 3B because they were diagnosed

with T1DM, CD and HT together. During the systemic examinations, Vitiligo was detected in 4 patients. 3 of the patients were diagnosed with the HT with one of or both of the Anti TPO and Anti Thyroglobulin positivity. The patients who had T1DM, Vitiligo and HT together were in the APS Type3C group. In a patient with T1DM and CD but no autoimmune thyroiditis, deep vein thrombosis developed, and factor V lieden mutation (homozygote) protein C and S deficiency MTHFR A 1298C mutation (heterozygote) were detected. The patient was evaluated in APS type4 group.

Conclusion

Upon 5 years of follow-up for the 483 patients with T1DM, the APS Type3B was determined in 12 of them. As a result, the APS frequency in T1DM patients has been determined as 2,48%; and the APS Type3B 1,65%, APS Type3C 0,62% and APS Type4 0,20%. Since it is known that various diseases may be included in the APS, it is considered that these rates may actually be higher.

BACKGROUND: Guidelines recommend estimation of glomerular filtration rate (GFR) and albuminuria as routine tests in hypertensive. Estimated GFR below 60 mL/min/1.73m² is considered as a major cardiovascular risk factor. **AIM:** To compare the GFR estimated with MDRD and CKD-EPI between hypertensive population "vs" non-hypertensive of Madrid Health Service.

METHOD:

Study design: Case-control, cross-sectional multicenter study conducted in 55 Health Centers of Madrid Health Service (Spain).

Study population: Simple random sampling of the population (168,853 adults) attached to 111 researchers physicians: 8609 subjects. Exclusion criteria: Untraceable or dataless: 21.66%; refused consent: 7.87%; no medical interview: 3.94%; pregnant, immobilized: 3.44%. Study subjects: 5392.

Statistical analysis: Qualitative variables: Percentages with 95% confidence intervals (CI). Chi-square; z-Test.

Quantitative variables: Means with standard deviation (±SD). Differences of means: T-Test after evaluating Levene test.

RESULTS:

Mean (±SD) age of the study population was 55.43 (±17.78) years. The percentage of male sex was 43.27% (41.94-44.60).

Prevalence of hypertension (HTN) was 36.78% (35.49-38.08). Prevalence of chronic kidney disease (CKD) was 11.76% (10.91-12.65).

Differences of descriptive variables and in prevalences of CKD stages and albuminuria between hypertensive "vs" non-hypertensive are described in tables 1 and 2.

In hypertensive population, the GFR mean estimated with MDRD-4 (83.97 mL/min/1.73m²) was slightly but significantly (p= 0.0014) higher than estimated with CKD-EPI (81.36 mL/min/1.73m²). There was no significant differences between prevalences of any CKD stage estimated with MDRD-4 "vs" CKD-EPI (Table 3).

CONCLUSIONS:

The GFR estimated with MDRD-4 and CKD-EPI are 14 and 18 mL/min/1.73m² respectively lower in hypertensive than in non-hypertensive.

The GFR < 60 mL/ min/1.73m² is five times more frequent in hypertensive than in non-hypertensive.

All prevalence differences in any stage of CKD between hypertensive "vs" non-hypertensive are significant.

In the hypertensive population, there are not significant differences in the prevalence of any CKD stages estimated with CKD-EPI "vs" MDRD-4.

Keywords: Hypertension; Glomerular filtration rate; Chronic kidney disease.

Differences in descriptive variables between hypertensive "vs" non-hypertensive.

Importance of Diagnosing Diabetes Mellitus For Primary Care: Case Report

Elif Altunbaş Ateş, Zehra Aslan Aydoğdu, Burcu Aykanat, Turan Set

Department of Family Medicine, Karadeniz Technical University, Trabzon, Turkey

Background&AIM: In this study, a case diabetes mellitus (DM) did not diagnosed previously was discussed from a diagnostic direction

CASE: Thirty one-year-old male patient was admitted to Family Medicine outpatient clinic with complaints of drinking a lot of water, frequent urination, dry mouth in the last two months. He was anxious; because his uncle died two months ago due to late diagnosed DM complications. He also stated 12 kg weight lost in the last 20 days, loss of appetite and itchy sores on his back at the last two months. On physical examination, general condition of the patient was good. Body mass index was 31.14. Other physical examination findings were normal as blood pressure of 130/80 mmHg. Laboratory results were fasting blood glucose: 280 mg/dl, total cholesterol: 333 mg/dL, triglyceride level: 898 mg/dL, high density lipoprotein-cholesterol: 37 mg/dL, low density lipoprotein-cholesterol: 202 mg/dL. According to these findings, additional tests for diagnosis are carried out such as glycosylated hemoglobin A1c (HbA1C): %14.2, insulin level: 11.6 uIU/mL and C peptide: 1,74 ng/ml. In urine analysis, ketone was 80 mg/dL and glucose was 1000 mg/dL. As a result, we diagnosed this patient as DM. He was consulted with endocrinology department in terms of the hospitalization indicate, diabetic ketoacidosis and initiating insulin therapy. At the same day, patient was hospitalized to the endocrine service.

CONCLUSIONS: Although our patient has good general condition, laboratory findings were bad according to clinical situation. In case of delay of this patient's application could occur major complications. Obtaining early diagnosis and treatment goals are very important in terms of preventing complications. Giving education to patients, the recommended diet and exercise is as important as medical treatment.

Screening individuals with risk factors for DM and early diagnosis are extremely important. Family physician who gives continuous care and knows best the medical history of patients has an important role.

P-0046

Assessment of Knowledge, Attitudes and Behaviors of Diabetic Patients About Diabetic Foot and Foot Care

Feyza Yücel, Didem Sunay

Department of Family medicine, Keçiören training and research hospital, Ankara, Turkey

Background and AIM: To assess the knowledge, attitudes and behaviors of diabetic patients about diabetic foot (DF) and foot care (FC).

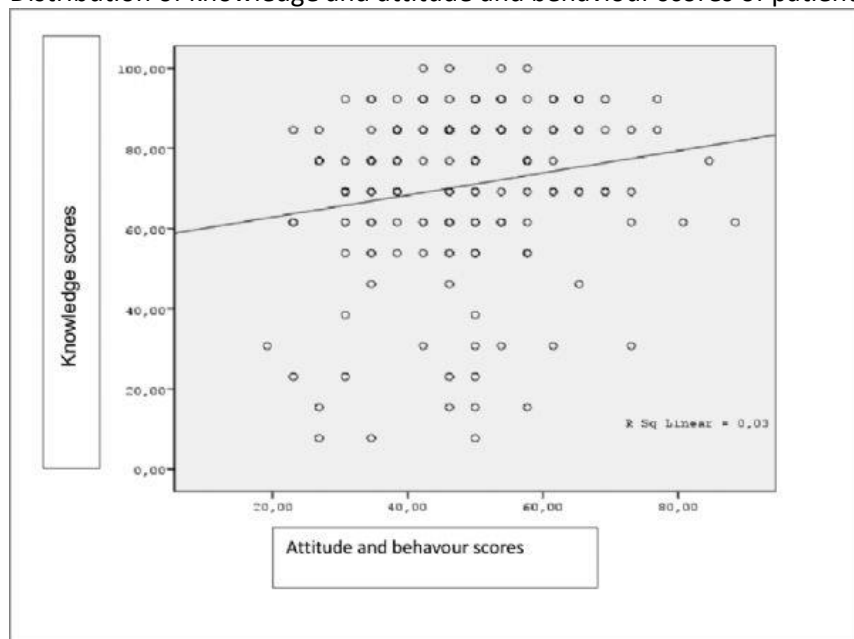

MATERIALS-METHODS: Patients attended to family medicine out-patient clinics with diabetes (DM) between May-August 2014 were included in this cross-sectional study. Data were collected by a questionnaire consisted of 56 items that questioned knowledge, attitudes, behaviors of patients about DF and FC. Correct answers were considered '1' point, wrong ones were '0' point. Collected scores were converted to hundred standard scores after the raw scores were calculated. The correlation and chi square analysis were used for the evaluation of associations between variables, Mann-Whitney U and Kruskal-Wallis H tests for the comparisons of groups.

RESULTS: 89 % of 176 patients were women, 21.0% were men. Mean age was 58.0 ± 10.6 years. The 45.5% of the patients noted that they do regular FC, 79% check soles regularly, %25.6 check inside of shoes while 54% were noted that they walk barefoot in and outside of home. According to physical examination findings 50% of them had high risk for DF. 65% of them had not received any education about DM, 90.9% about DF and FC. The average knowledge score was 70.6 ± 21.1 , attitude and behavior score was 48.1 ± 13.3 out of 100. There was a positive correlation between knowledge scores and attitude and behavior scores. Attitude and behavior scores were high in patients whom were followed up 10-20 years, controlled regularly and who had high risk for DF. All scores were high in patients who had another DM patient in the family.

CONCLUSION: It was seen that diabetic patients did not received education about DF and FC, also did not practice even if their knowledge was enough.

P-0047**Physical Activity Levels of Patients Admitted to Family Medicine Clinic**

Salih Zekeriya Karslıoğlu, Elif Altunbaş Ateş, Turan Set

Department of Family Medicine, Karadeniz Technical University, Trabzon, Turkey

AIM: Physical activity is one of the most important elements for healthy lifestyle. This study aimed to evaluate the physical activity level of the patients.

METHOD: Research was performed sectionally in 424 patients between May 2014 and February 2015 at Karadeniz Technical University Family Medicine Clinic. Questionnaire which includes demographic characteristics and physical activity level was administered face to face to participants. Physical activity status was categorized.

Patients were stated if body mass index (BMI) is <25 as normal, 25 to 29.9 as overweight and ≥ 30 as obese.

RESULTS: Female and male patients rates were 66.7% and 33.3% respectively. While 0.9% of patients were immobile, 91.5% were less mobile. The mean age of immobile and less mobile group was 40.1, of the mobile and much mobile group was 39.7 years ($p > 0.05$). The mean BMI of immobile and less mobile groups was 27.64; mean BMI of mobile and much mobile group was calculated 25.66 ($p = 0.064$). Obesity rate in immobile and less mobile group was 29.3%, obesity rate in the mobile and much mobile group was 12.5% ($p = 0.119$). The mean age of normal, overweight and obese patients were 36, 40.2 and 45.7 respectively ($P < 0.001$). All three groups were significantly different from each other in mean age ($p < 0.05$).

DISCUSSION: We are faced with a population of overweight and nonmobile. Today, decreased time devoted to physical activity. Stating no association between age and physical activity level implies the risk for obesity for young people. Taking precaution for obesity would be beneficial at a young age because reaching normal weight is very difficult for old people.

CONCLUSION: Physical activity has an important role in preventing disease and development of health and it should become a lifestyle. Because of this, comprehensive health care family physicians should educate individuals followed. In addition providing of physical activity opportunity in schools, residential areas and the municipal parking area would be useful.

P-0048**Reading concordance in hypertensive retinopathy with nonmydriatic fundus camera between general practitioners versus an ophthalmologist**

Rosa Forés¹, M^a Teresa Alzamora¹, M^a Mar Domingo¹, Anna Girona², Judit Llussà¹, Joaquim Fernández¹, Antonio Heras¹, Ana M^a Altaba¹

¹Institut Català de la Salut. Barcelona. Spain

²Hospital de Barcelona. Spain

Background & AIM: The evaluation of retinal changes associated with hypertension is so far a subjective and subject to the expertise and experience of the observer. The aim of this study is to assess the reading concordance in hypertensive retinopathy with nonmydriatic fundus camera between general practitioners versus a professional expert (ophthalmologist).

METHOD: Cross-sectional study of reading concordance in retinal changes. An ophthalmologist and 6 general practitioners (GP1 to GP 6) assessed retinal photography images of 775 hypertensive patients aged 50 to 70 years old made by nonmydriatic fundus camera. A learning workshops were previously performed. Retinal changes with the classification of Keith-Wagener were evaluated. Classifications obtained for each of the six family physicians with the ophthalmologist were compared. Index Kappa was calculated.

RESULTS: The Kappa indexes obtained in the severity levels were to GP 1: 0.311 (0.24 to 0.38), GP 2: 0.475 (0.41 to 0.54), GP 3: 0.429 (0.36 to 0.50), GP 4: 0.303 (0.25 -0.36), GP 5: 0.473 (0.41 0.54) and GP 6: 0.215 (0.16 to 0.27). All values were between 0.2 and 0.5 so that the agreement is low / poor.

CONCLUSIONS: Assessment of retinal lesions due to arterial hypertension by retinography presents a major problem of subjectivity. It would be necessary to incorporate a more objective assessment technique to improve these determinations.

Keywords: Arterial hypertension, Retinopathy, Concordance

Interobserver concordance Kappa coefficients and confidence intervals of 95% obtained in the evaluation of the fundus with reference to the expert ophthalmologist.

Evaluation of clinical practice in primary care on gout treatment

Ines Abreu Mendes¹, Mileta Gomes², Ieda Paula³

¹USF D.Sancho I - Aces Lezíria - Portugal

²UCSP Almeirim - Aces Lezíria – Portugal

³USF Cynthia - Aces Sintra - Portugal

The gout prevalence has doubled in recent decades and we must optimize its management.

We studied a sample of patients with gout, in different disease's stages, quantifying the number with associated pathologies and identifying the takings medicine that could modify uricemia values.

METHODS: Retrospective study of gout diagnosed patients in files of three family doctors.

Variables: gender, age, uricemia year follow-up stages: initial uricemia (T0), after hipouricemic therapy within less than 6 months (T1) and last uricemia value (T2).

From 5713 patients, 80 (1.4%) were diagnosed gout. The average age with gout is 63.1 years and consists of 72 men. The average follow up of men was 8.44 years and 7.25 for women.

The uricemia at T0 was 72.5% above 8mg/dl and T1 uricemia were 27.5% below 6 mg / dl and 7.5% above 8 mg / dl. There was a significant drop in uricemia values from T0 to T1 ($p < 0.001$) and from T0 to T2 ($p < 0.001$). Between T1 and T2 was a significant increase in uricemia values ($p = 0.039$). This could be due to less continuity in gout cronic treatment.

Comorbidities: 25% of patients with type 2 diabetes mellitus, 70% hypertension, 15% renal calculi, 37.5% overweighted, 51% obesity, 37.5% mixed dyslipidemia, 35% hypertriglyceridemia and 7,5% hypercholesterolemia. Gout therapy used: NSAIDs in 95% of patients, allopurinol in 95% (2.5% had allergy to allopurinol), colchicine in 42.5%.

Of remaining chronic medication, 47.5% of patients were treated with diuretics and 50% with a statin, both drugs with hiperuricemic potential.

This sample characterization allowed the identification of potential improvements in monitoring and treatment of gout and its comorbidities. Vigilance and therapy adherence are fundamental to achieve the therapeutic goals.

When it's possible, hypertension and dyslipidemia should be treated with drugs, such as fenofibrate, losartan and amlodipine, by their hipouricemic effect.

Keywords: Gout treatment, comorbidities, management

Evaluation of Serum Uric Acid Levels and Cardiovascular Risk Factors in Patients with Cardiovascular Disease

Hasan Ayberk Çakırlar¹, Didem Kafadar¹, Süleyman Sezai Yıldız², Mustafa Hakan Dinçkal²

¹Department of Family Medicine, Bağcılar Training and Research Hospital, Istanbul, Turkey

²Department of Cardiology, Bağcılar Training and Research Hospital, Istanbul, Turkey

Background & AIM: In this study, our aim was to evaluate the relationship between uric acid levels and cardiovascular risk factors and severity of coronary artery disease(CAD) in patients with cardiovascular diseases by analyzing laboratory values and comorbidities of patients such as hypertension, dyslipidemia and metabolic syndrome.

METHOD: 418 patients, 149 women and 269 men, who have admitted to cardiology and emergency outpatient clinics of our hospital between 01.01.2013 and 31.07.2014 were included to this retrospective study. In these patients, serum uric acid levels were present before coronary angiography was performed. In women, uric acid levels ≥ 6 mg/dL and in men ≥ 7 mg/dL were considered as hyperuricemia. Gensini Score(GS) was used to evaluate the angiographies. Patients were considered as having serious CAD if they had $GS \geq 20$. Laboratory values and CAD data of the patients were evaluated retrospectively.

RESULTS: In patients with higher uric acid levels, mean age was statistically more than patients with lower uric acid levels($p=0,003$). Women with high uric acid levels were statistically more than men with high uric acid levels($p<0,001$). Men with $GS \geq 20$ were more than women with $GS \geq 20$ ($p=0,016$). In patients with serious CAD according to gensini score, glucose ($p=0,003$), HbA1c ($p=0,012$), creatine ($p=0,003$) mean values were statistically higher than patients with $GS<20$. HDL levels were statistically lower in patients with serious CAD($p=0,038$). When patients were grouped according to uric acid levels, there was no significant difference between GS groups of patients ($p=0,59$).

CONCLUSIONS: Coexistence of hyperuricemia with other CAD risk factors such as hypertension, diabetes, obesity, dyslipidemia, smoking, and age remains the most important handicap in evaluating high uric acid values. We may conclude that uric acid is a marker of metabolic burden rather than being an independent risk factor for CAD. Prospective studies in large groups are still needed.

Prevalence of chronic non-communicable diseases in family medicine practice

Olivera Batic Mujanovic¹, Larisa Gavran², Lejla Kunosic³, Lejla Piric⁴, Munevera Becarevic⁵, Esad Alibasic⁴

¹Family Medicine Teaching Center of Health Center Tuzla; Department of Family Medicine, Medical Faculty of Tuzla University, Tuzla, Bosnia and Herzegovina

²Family Medicine Teaching Center Zenica, Zenica, Bosnia and Herzegovina

³Health Center Teocak

⁴Health Center Kalesija, Kalesija, Bosnia and Herzegovina

⁵Health Center Banovici, Banovici, Bosnia and Herzegovina

Background & AIM: Chronic non-communicable diseases account for almost 60% of global mortality, and 80% of deaths from chronic non-communicable diseases occur in low and middle income countries. The aim of this study was to investigate prevalence of four main types of chronic non-communicable diseases in family medicine practice.

METHODS: This study included 580/1492 medical records of patients with chronic non-communicable diseases registered in family medicine team at the Family Medicine Teaching Center Tuzla. We analyzed prevalence of modifiable risk factors for chronic non-communicable diseases (high blood pressure, obesity and smoking) and main types of chronic non-communicable diseases (cardiovascular diseases, cancers, chronic respiratory diseases and diabetes).

RESULTS: Prevalence of chronic non-communicable diseases was 38.87% (580/1492). Mean age of participants was 60.282 ± 14.95 years; 60.12 ± 16.01 years for women and 60.44 ± 13.89 years for men ($p=1$). There were significantly more women with diagnosis of chronic non-communicable diseases than men (66.55% vs. 33.45%;

p<0.0001). Majority of patients belonged to the age group 60-80 years (49.48%), 34.31% belonged to the age group 40-60 years, 11.55% belonged to the age group 10-40 years, and only 4.65% of patients were older than 80 year. Hypertension had 404 patients (69.66%), 392 patients (67.59%) were overweight or obese, and 202 patients (34.83%) smoked. Diagnosis of cardiovascular diseases had 162 patients (27.93%), cancers were diagnosed in 43 patients (7.23%), diabetes had 76 patients (13.1%), while 94 patients (16.21%) had chronic respiratory diseases. More than third of patients had some of the musculoskeletal diseases (38.44%), and 11.89% of patients had thyroid gland diseases.

CONCLUSION: Results of this study showed a high prevalence of chronic non-communicable diseases in primary health care, especially cardiovascular diseases. Healthy lifestyle including functional food, regular physical activity and a non-smoking policy is one of the most promising factors in primary and secondary prevention of chronic non-communicable diseases.

Differential diagnostic of hand osteoarthritis

Sara Matos Moreira, Gabriela Silva Poças, Luis Monteiro Magalhães
 USF Leça, Unidade Local de Saúde de Matosinhos, Matosinhos, Porto, Portugal

BACKGROUND

Hands are frequent sites of loco-regional disease. They are very rich sources of information and may represent a rheumatic patient’s business card.

Hand Osteoarthritis is a heterogeneous condition of high prevalence with a negative impact in the quality of life.

AIM

Review the available knowledge about the differential diagnosis of hand osteoarthritis.

METHOD

Literature review in medical databases based on evidence, using MeSH terms: osteoarthritis, hand.

RESULTS

To date, there is no gold standard for the hand osteoarthritis diagnosis. The differential diagnosis of this entity with other arthropathies must take into account several factors, including clinical manifestations, risk factors (age and gender), onset and progression of symptoms, degree of rigidity, joints involved, presence of Heberden and Bouchard nodes, synovitis signs, joint damage, without neglecting the contribution of imaging and laboratory findings.

The differential diagnosis of hand OA is extensive. In general practice, predominates, Carpal Tunnel Syndrome followed by De Quervain's tendonitis.

The most common disorders are Psoriatic Arthritis (distal interphalangeal joints or just a distance), Rheumatoid Arthritis (metacarpalphalangeal, proximal interphalangeal and wrists), Gouty Arthritis (may override the pre-existing osteoarthritis) and Hemochromatosis (metacarpophalangeal and wrists). It is important to highlight that most systemic rheumatic diseases have in the hands, significant and often diagnostic translation.

CONCLUSIONS

Despite hand osteoarthritis having a high worldwide prevalence with high levels of disability, resulting in absenteeism and early retirement, with a significant impact on the patient and family quality of life, as well as the social and economic level, research in this area is still very limited.

Keywords: osteoarthritis, hand

Differential Diagnosis of Hand Arthropathies

DIAGNOSIS	CLINICAL MANIFESTATIONS
Carpal Tunnel Syndrome	Hand paresthesias in the median nerve area. Predominance in the morning and during the night. Positive Tinel’s sign and Phalen’s tests.
Cubital Tunnel Syndrome	Ulnar paresthesias in the edge of the forearm and hand. Positive Tinel’s sign over the cubital tunnel in the elbow or in Guyon's canal.

De Quervain's Tenosynovitis	Pain in the outer edge of the wrist and thumb. Mechanical rhythm. Painful palpation site. Positive finkelstein's test.
Flexor Tenosynovitis	Inflammatory or mechanical pain. Active finger flexion limitation. Trigger finger.
Dupuytren's Contracture	Palmar fascia retraction of the 3rd, 4th or 5th fingers.
Rhizarthrosis	Mechanical pain at the base of the thumb and radial edge of the handle.
Nodal Osteoarthritis	Mixed rhythm pain. Proximal and distal interphalangeal. Firm joint nodules.
Arthritis	Inflammatory pain. Hard-elastic joint swelling.

P-0053

Approach on vertigo in primary health care

Sara Matos Moreira, Gabriela Silva Poças, Luis Monteiro Magalhães
USF Leça, Unidade Local de Saúde de Matosinhos, Matosinhos, Porto, Portugal

BACKGROUND

Vertigo corresponds to 54% of the cases of dizziness in primary health care. In these, 85-90% is due to a vestibular system pathology, being the benign paroxysmal positional vertigo the most common, followed by Meniere's disease and vestibular neuritis.

AIM: Review the available knowledge on the management of vertigo in primary health care.

METHOD: Literature review in medical databases based on evidence, using the MeSH terms: peripheral vertigo, primary care.

RESULTS: In vertigo's differential diagnosis it is important to specify the duration of attacks, presentation, character and intensity, triggers, associated symptoms (ear and neurovegetative or neurological). It is also relevant to inquire history of cardiovascular, renal, diabetes, neurological diseases, syphilis, ototoxic drugs and head injury.

A detailed medical history with the comprehensive characterization of symptoms is critical to differentiate the peripheral etiology from the central (consult table), without neglecting the importance of a careful and directed physical examination, which should include the otoscopy, acumeny, neurological and cardiovascular examination; it also includes the vestibular exam, with a vestibular-spinal and vestibular-ocular function assessment, presence of nystagmus with and without ocular fixation.

The diagnosis of the entities responsible for peripheral vertigo syndrome is clinical. Ponder using complementary diagnostic procedures in the presence of an atypical clinical case which may suggest other etiology.

The symptomatic treatment of vertigo should have a short time, serving only as a way for the patient to tolerate the vestibular rehabilitation exercises, which will be the definitive treatment.

CONCLUSIONS: The diagnosis is essentially clinical, with approach and treatment within reach of primary health care, but it is crucial to adopt a systematic approach to exclude central pathology. The referral to other specialties should be reserved for the most serious cases which exceed the ability of resolution by the family physician.

Keywords: peripheral vertigo, primary care

Vertigo's Differential Diagnosis

	PERIPHERAL	CENTRAL
ANATOMY	Injury to the vestibular nerve or labyrinth	Injury from the vestibular nucleus
BEGIN	Sudden	Insidious
CHARACTER	Paroxistic (compensation)	Continuous
INTENSITY	Intense	Light

DURATION	Finite but recurrent Seconds, min., hours a days	Chronic Months without compensation
ASSOCIATED SYMPTOMS	Hearing loss, tinnitus, hearing pressure, intense neurovegetative symptoms (nausea, vomiting, diaphoresis)	Neurological and vascular symptoms Lack of hearing symptoms or marked neurovegetative symptoms
AGGRAVATING FACTORS	Head movements (intense aggravation)	Head movements (Slight increase)
CALORIC REACTIONS	Normal or reduced	Standard, rarely dissociated
DIRECTION OF THE FALL	Tendency to unilateral	To both sides
ROMBERG TEST	Unidirectional (coherent)	Multidirectional (incoherent)
NYSTAGMUS	Horizontal Unidirectional with fast phase opposite to the lesion Seconds after vertigo, (5-12 second time latency) Fatigable disappears in days, decreases with eye fixation	Vertical Unidirectional or bidirectional Instant start, non fatigable, from weeks to months, not influenced by eye fixation

Knee Osteoarthritis in Primary care patients

Patricia Marquez¹, Jose M Segura², Delia Rodriguez², Maria Del Carmen Fernandez²

¹Clinica Cajal, Las Palmas de Gran Canaria, Spain

²Centro de salud Canalejas, Las Palmas de Gran Canaria, Spain

Introduction/ OBJECTIVE:

The knee is one of the joints most commonly affected by osteoarthritis and second most common cause of musculoskeletal consultation in primary care. As this joint takes an important role in walking, any pain or disability affects a person's daily life activities. The aim of our study is to determine in a period of time from the 1st June 2014 and 30th November 2014 in a Primary Care centre of the island of Gran Canaria, the number of adults, above 50 years old, being radiologically diagnosed of bilateral knee osteoarthritis, its level of knee pain, functional disability measured with VAS and WOMAC score.

METHODS: An observational, descriptive and retrospective study was designed. The data was collected from the electronic clinical registries in a Primary care centre.

RESULTS: 300 cases were studied, 78,2 % women and 22,8% men, with an average age of 69,5 years old, with BMI between 25-29,9: overweight 58% and above 30: obese (33%). In the VAS 55,8% moderate pain (45–74 mm), 27,5% mild pain (5-44mm) 16,7% severe pain (75–100 mm). With the WOMAC score the most affected activity 80,9% was walking up/down stairs followed by 77,5% rising from sitting and standing upright 67,5%.

CONCLUSION: The importance in of knee osteoarthritis in primary care due to its prevalence and the use of simple questionnaires to evaluate level of knee pain and disability in daily life of our patients, to avoid chronicity and evaluate effectiveness of treatment prescribed.

Cases of Systemic Lupus Erythematosus: The Role and Importance of Physical Examination in Family Physician

Ömer Akca¹, Adem Bahadır¹, Turgay Albayrak⁴, Iskender Bülbül¹, Ihsan Ateş², Tarık Eren Yılmaz¹, İrfan Şencan¹, İsmail Kasım¹, Rabia Kahveci¹, Adem Özkara³

¹Department of Family Medicine, Ankara Numune Training and Research Hospital, Ankara, Turkey

²Department of Internal Medicine, Ankara Numune Training and Research Hospital, Ankara, Turkey

³Department of Family Medicine, Çorum Hittite University, Çorum, Turkey

⁴Department of Family Medicine, Dr. Abdurrahman Yurtaslan Training and Research Hospital, Ankara, Turkey

In United States one of every seven patients apply to the family physician with musculoskeletal complaints. Some of these patients have rheumatologic diseases which is chronic and causes loss of workforce. So it is very important to diagnosis and provide treatment.

Twenty-four years old female patient applied with complaints of asthenia and fatigue. Anemia and symptomatic treatment was given before where the patient applied with these complaints. It was learned from the anamnesis that there have been widespread pain in major joints, increasing rash on the face when get the sunshine and frequently recurring sores in mouth and genital area. On physical examination, hair loss, joint swelling, arthritis, Reynold's positivity, stomatitis and genital ulcers were detected. There was rubescence (photosensitivity) compatible with typical rash on her face. Tests aimed at diagnosis were asked on suspicion of there may be a rheumatic disease. In laboratory tests:

ANA:2++, dsDNA:25.2(+), pANCA+, MA/creatinine:106.03. Anti scl:70, Rose Bengal burecell scanning, grub Widal, Anti-sm anti-cm/RNP, anti-ssA, anti-ssB, anti-Jo-1, c-ANCA results were negative.

The patient was referred to rheumatology clinic with the pre-diagnosis of systemic lupus erythematosus according to examination and blood test results. Patient whose diagnosis confirmed in rheumatology, was hospitalized and her treatment was started. The patient is still following-up from rheumatology department, during her follow-up she became pregnant and gave a healthy birth. Missing or late diagnosis of rheumatic diseases, affects the patient's life and quality of life in a negatively way. As the family physicians serve a wide mass in terms of patient and disease, they should have minimal extent knowledge of rheumatic diseases as in other diseases. As in our case early diagnosis, follow-up and treatment of the disease contribute to lead more healthy and quality life in patients' social life. If the patient was not early diagnosed and did not passed a followed-up pregnant, patient could have; nephritis, kidney failure, stroke, vasculitis, anemia, pericarditis, pneumonia, born child could have; developing neonatal lupus, neonatal heart block, skin rash, liver abnormalities.

Insulin resistance and increased cardiovascular risk in newly diagnosed hypertensive patients who were admitted to nephrology clinic

Tuba Dilek Ateş¹, Kenan Topal¹, Sibel Ada²

¹Adana Numune Research and Training Hospital, Department of Family Medicine

²Adana Numune Research and Training Hospital, Department of Nephrology

BACKGROUND: Cardiovascular disease (CVD) is the main leading cause of death in our country. The risk factors like hypertension, diabetes, metabolic syndrome, dyslipidemia should be controlled to reduce CVD. Insulin resistance (IR) has an important role in the pathophysiology of these risk factors. We investigated the presence of the other components of metabolic syndrome in patients with newly diagnosed essential hypertension. Specifically, we aimed to determine the relationship between hypertension and IR.

METHOD: This cross-sectional study included 128 newly diagnosed essential hypertension patients aged between 18-55 years who were admitted to Nephrology Clinic between 01.07.2014-31.01.2015. The patients were analysed for metabolic syndrome criteria, IR and CVD risk after sociodemographic data had been collected, anthropometric measurements and blood pressure staging had been done.

RESULTS: Of 125 patients, 65 were female; mean age was 42.3±7.8 years. Blood pressure was classified as first degree (n=46, 35.9%), second degree (n=55, 43%), and third degree (n=27, 21.1%). IR was detected in 66 patients

(51.6%). Eighty third patients (64.8%) had metabolic syndrome, %57.8 of metabolic syndrome patients and 40% of non-metabolic syndrome patients had IR. Also IR was detected in 2 patients (12.5%) with normal body mass index in 24 overweight patients (55.8%) and in 40 obese patients (58%). According to the 2013 ESH hypertension guidelines, CVD risk status was evaluated in six groups (low risk: 1, very high risk: 6). CVD risk score was significantly higher in patients with IR (4.02 ± 0.984 vs 3.58 ± 0.915). The difference between IR and CVD risk score elevation was statistically significant ($t: -2.582, p=0.011$).

CONCLUSIONS: We found a high rate of IR in newly diagnosed hypertensive patients. CVD risk score was higher than that of the hypertensive patients without IR.

⁴Family Medicine Teaching Center of Health Center Mostar, Mostar, Bosnia and Herzegovina

Background & AIM: Prevention and management of chronic non-communicable diseases are the main goals in family medicine practice. Aim of this study was to assess quality of chronic respiratory diseases care provided by family medicine team through a medical audit.

METHODS: This retrospective analysis included 44/1492 medical charts of patients with chronic respiratory diseases: chronic obstructive pulmonary disease (COPD) and asthma at the Family Medicine Teaching Centre Tuzla. Audit record form contained questions on gender, age, smoking status, advice to stop smoking, spirometry, and prescribed medications.

RESULTS: Prevalence of chronic respiratory diseases were 2.95%, without significantly difference between men and women (47.73% vs. 52.27%; $p=0.67$). Significantly more patients had COPD than asthma (81.82% vs. 18.18%; $p<0.0001$). COPD had 50% men and 50% women, while 62.5% women and 37.5% men had asthma, without significant differences related to gender ($p=1$; $p=0.3173$). Mean age of patients with COPD was 65.38 ± 7.26 years, and for asthma 23.34 ± 6.89 years. There were 38.89% smokers, 27.79% ex smokers and 30.55% never smokers in COPD group. All patients with asthma had never smoked. Smoking status was recorded for 93.18% patients. Stop smoking advice was given for 58.33% patients with COPD. Pulmonologist report was recorded significantly more in patients with asthma than COPD (100% vs. 69.44%; $p=0.0001$), but spirometry was recorded significantly more in patients with COPD than asthma (69.44% vs. 25%; $p=0.0195$). Majority of patients used beta2-agonists (75%), glucocorticoid used 22.73%, combined beta2-agonist and glucocorticoid used 31.82%, and anticholinergic therapy used 22.73% of patients. Leukotriene receptor antagonist used 50% of patients with asthma. Methylxanthine drug (teophylline) used 8.33 patients with COPD.

CONCLUSION: Results of this study showed a high prevalence of deficiencies in quality of care for chronic respiratory diseases in family medicine that suggests actions to prevent and control chronic respiratory diseases in primary health care.

Control of old hypertensive patients with comorbidities

Pedro Alejandro Gonzales Flores, Silvia Sanchez Casco, Monica Pons Querol, Ione Veronica Mejia Ganoza, Giancarlo Jesús Ormeño Victorero
Catalan Health Institute, CAP Les Fontetes, Cerdanyola del Vallès, Barcelona, Spain

OBJECTIVES

- 1.To determine the degree of control of the patients with High Blood Pressure in the CAP Les Fontetes.
- 2.To determine the presence of diabetes in these patients and to assess its control.
- 3.To determine the main TOI (Target organ injury) of studied patients and the established cardiovascular disease (ECD)

METHODOLOGY

Patients with HBP of the CAP FONTETES (Cerdanyola del Vallès. Barcelona) was studied in a descriptive and cross. Were chosen 583 (80%). The two guides used were one of the Catalan Health Institute (ICS) and the another one of the European Hypertension Society (EHS). The TOI, the presence of diabetes and established Cardiovascular disease and its respective control were determined. Results were processed using the SPSS system.

RESULTS

Prevalence of hypertension was 46.3%. We selected 583 patients (80.2%). 341 were women (58.5%). The degree of control was 59.5% and 69.9% according the used guide. 162 had diabetes (27.8%) being the control right in 64.2% and 74.1% (ICS and ESH guide). The TIO were 22 left Ventricular hypertrophy and Microalbuminuria 28 (4.8% and 3.77%), and their control were 50% and 72,7% (ICS) and 60,7% and 81,8% (EHS). Established cardiovascular disease were: heart disease 82 (14.07%), kidney failure, 67 (11.49%), AVC 27 (4.63%), arterial disease 15 (2.57%). Patients with ECD control was: 64.3% heart disease, Chronic Renal Failure 56.7%, AVC 74.1% and arterial disease 66.7% (ICS Guide) and 75.6%, 66.6% and 85.2%, and 80% (EHS guide)

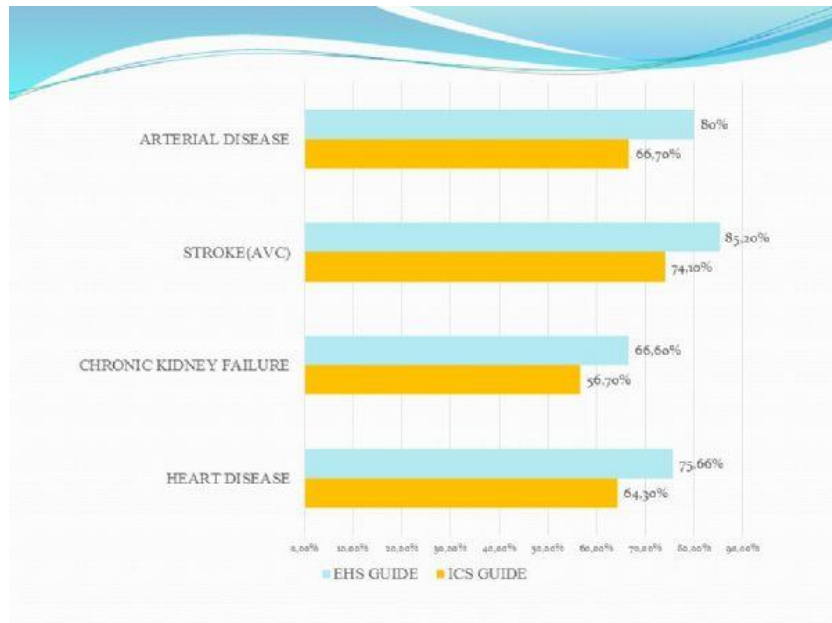

CONCLUSIONS

- 1.The degree of control was 59.5% (ICS) and 69.9% (ESH)
2. Presence of diabetes mellitus was 162 (27.8%) being controlled by 64.2% and 74.1% according the guide used.

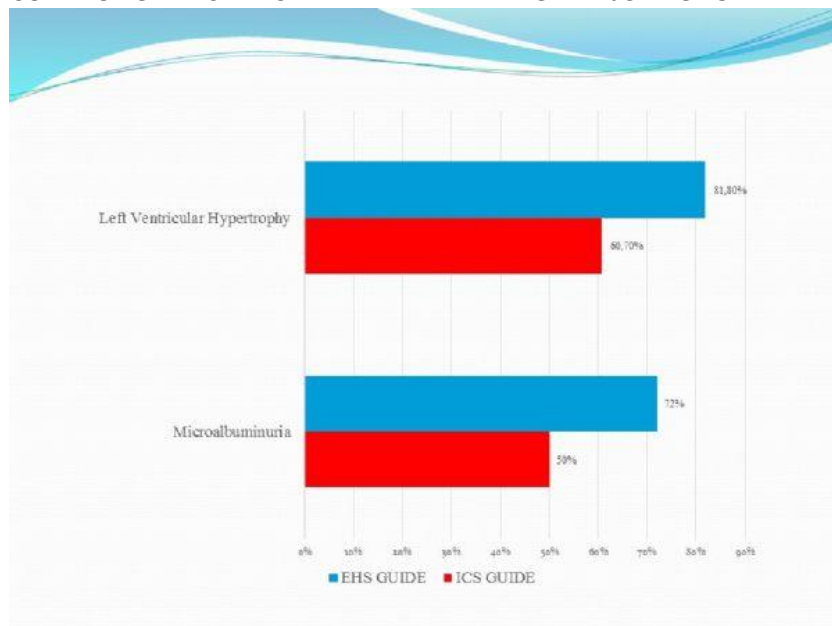

- 3. Control of the patient with TOI: Microalbuminuria and LVH is 50% and 72%
- 4. Control of heart disease 64.3%, 56.7% Chronic Renal Failure, AVC 74.1% and 66.7% arteriopathy. No differences with the literature

Control of the old hypertensive patient

Pedro Alejandro Gonzales Flores, Silvia Sanchez Casco, Pablo Rubinstein Aguñin, Monica Pons Querol
Catalan Health Institute, CAP Les Fontetes, Cerdanyola del Vallès, Barcelona, Spain

OBJECTIVES

1. To determine the degree of control of the patients older than 65 with HBP in one centres of primary care.
- 2 To. Compare, if there are differences, with the application of the guide of the ICS and the ESH Guide.
- 3 To determine what kinds of treatment we use for the control of the patient with HBP.

METHODOLOGY

Patients with HBP CAP Fontetes (Cerdanyola del Vallès). Were chosen 583 of 727 patients with HBP. As good control was established the number of TA < 140/90 as indicated in the ICS and the limit of 150/90 according to the guide of the ESH in elderly people. The patients were divided into 3 age groups; 65, 65-79 and 80 years old. The results were processed using the SPSS system version 4.0

RESULTS

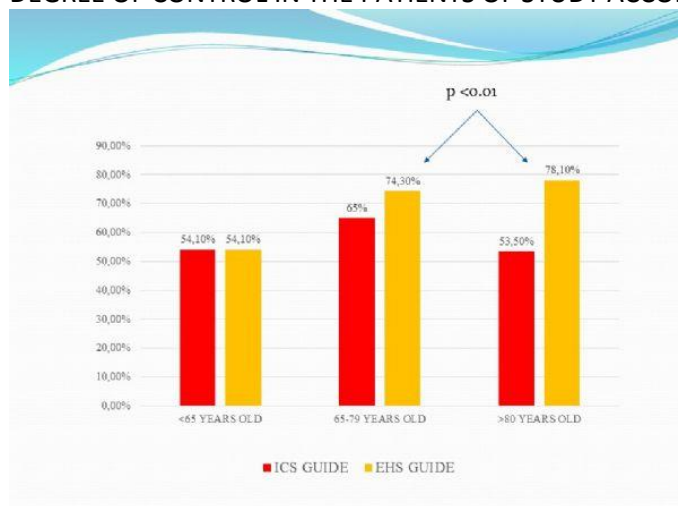

Prevalence of HBP was 46.3%. We selected 58 (80.2%). 341 were women (58.5%). 109 were under 65 years (18.7%), 300 between 65-79 (51.5%) and 174 older that 80 years old (29.8%). The main treatments were: ARA II 96 diuretics (16.47%), ACE diuretic 93 (15.95%), Aceis 81 (13.89%), ARA II 46 (7.89%), diuretics 34 (5.83%) and other 116 (19.90%). The degree of control by the ICS guide was 59.5% (347) and using the ESH guide 69.9% (408). In the patients control; 65 65 to 79 years old and 80 years old was 54.1%, 65% and 53.5% respectively using the ICS guidelines, while if we use the guide of the SEH control was 54.1%, 74.3% and 78,1% respectively ($p = 0.01$)

CONCLUSIONS

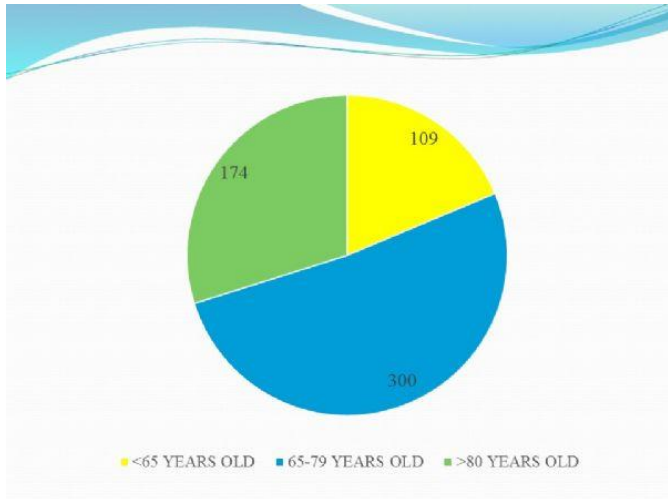

1. There is variability with respect to different treatments used for the treatment
2. The degree of control of hypertension was 59.5% and 69.9% (ICS vs EHS guide)
3. The population older than 65 years old is properly controlled, even reaching the 78.1% if we adjust the data to guide the SEH

Assessment of Diabetic Nephropathy in Patients with Diabetes Mellitus at Vilnius Outpatient Clinics

Monika Niedvaraitė¹, Zdrune Visockienė¹, Laura Siaulienė³, Margarita Lasevic¹, Estera Muchlyte¹, Asta Sakaite¹, Daura Raudonyte¹, Dalia Palisaityte¹, Rima Povilioniene¹, Ruta Baneviciute Domarkiene¹, Roma Puronaite², Vytautas Kasiulevicius¹, Virginijus Sapoka¹

¹Vilnius University Faculty of Medicine, Vilnius, Lithuania

²Vilnius University Hospital Santariskiu Klinikos, Vilnius, Lithuania

³Karoliniskiu Outpatient Clinic, Vilnius, Lithuania

BACKGROUND AND AIM: Diabetic nephropathy (DN) is the leading cause of renal failure in patients with diabetes. Regular outpatient follow-up is key in managing DN successfully. The aim of our study was to assess the annual screening for DN and the incidence of DN in patients with type 1 diabetes mellitus (T1DM) and type 2 diabetes mellitus (T2DM) at Vilnius outpatient clinics.

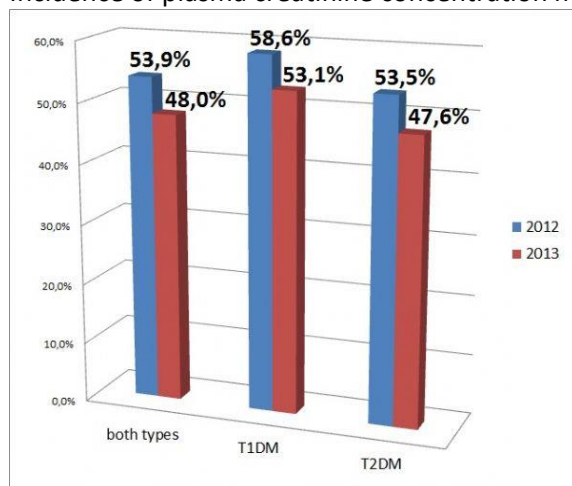

METHODS: A retrospective collection of data covering the period from 2012 to 2013 was performed in 5 largest Vilnius outpatient clinics. There were 1719 adult patients with T1DM and T2DM randomly selected. Information on basic patient's characteristics, diabetes type, duration of disease, annual assessment of plasma creatinine concentration, urinary albumin-to-creatinine ratio or microalbuminuria, presence of diagnosed DN was collected from clinical notes and electronic database system.

RESULTS: There were 7,4% of T1DM and 92,6% of T2DM in the group of 1719 patients, 58,9% were females. The mean age of subjects was 64±13,4 years, average duration of diabetes - 8,1±6,9 years. Plasma creatinine concentration was measured in 53,9% of patients (58,6% in T1DM; 53,5% in T2DM) in 2012 and in 48,0% (53,1% in T1DM; 47,6% in T2DM) in 2013. Urinary albumin-to-creatinine ratio or microalbuminuria was measured in 9,4% of patients (32,8% in T1DM; 7,5% in T2DM) in 2012 and 9,9% (29,7% in T1DM; 8,3% in T2DM) in 2013. Diabetic nephropathy was diagnosed in 8,4% of subjects in the whole group (21,1% in T1DM and 7,4% in T2DM).

CONCLUSIONS: Our study revealed a quite high rate of diabetic nephropathy and poor annual monitoring for renal complications in patients with type 1 and type 2 diabetes at Vilnius outpatient clinics. Probably, certain amount of diabetic kidney disease remained undiagnosed, because of inadequate screening. Family doctors have to put more efforts in performing screening for diabetic nephropathy in every patient with diabetes.

³Karoliniskiu Outpatient Clinic, Vilnius, Lithuania

BACKGROUND AND AIM: Data about diabetes control in Lithuania are poor while information about situation in the largest capital city Vilnius is missing. The aim of our study was to assess long-term diabetes control in relation to disease duration and complications in type 2 diabetes mellitus (T2DM) subjects in Vilnius.

METHODS: A retrospective collection of data on diabetes management, covering the period from 2012 to 2013 year inclusively was performed in 5 largest public primary Vilnius outpatient clinics and included a sample of 1591 randomly selected T2DM patients. Information on diabetes duration, glycated hemoglobin (HbA1c) and the presence of complications (retinopathy, nephropathy, polyneuropathy, angiopathy) was collected from clinical notes and electronic database system into the standardized data collection form. Diabetes duration was classified into 5 categories: 0-5, 6-10, 11-15, 16-20, >20 years. Target HbA1c was ≤7%.

RESULTS: The average HbA1c in T2DM subjects was 6,7±2,1%. The target HbA1c was achieved in 61,2% of patients. The lowest HbA1c of 6,3±2,1% was estimated in the group with T2DM duration of 0 -5 years, the highest - 7,5±1,9% - in the group with disease duration of 16-20 years. There was no further worsening of diabetes control with DM duration >20 years, where HbA1c was 7,1±2,2%. Patients with one DM complication had HbA1c 7,3±1,5%, with two - 7,6±1,5%, with three – 8,7±1,9%, with four - 8,8±1,1%.

CONCLUSIONS: Our analysis revealed a very good level of long-term diabetes care in reaching glycemic goals at Vilnius outpatient clinics. However, there was a clear tendency of worsening glycemic control with diabetes duration and the increasing number of complications. Family doctors have to put more efforts to manage T2DM in a subset of patients with long disease duration and complications.

Keywords: type 2 diabetes, primary care, glycated hemoglobin

Table 1. Average glycated hemoglobin in different diabetes duration categories.

Diabetes duration (years)	HbA1c, % (in T2DM subjects)
0-5	6,3±2,1
6-10	7,0±1,4
11-15	7,3±2,3
16-20	7,5±1,9
>20	7,1±2,2

³Karoliniskiu Outpatient Clinic, Vilnius, Lithuania

Background and AIM: Diabetic retinopathy (DR) remains the most common complication of diabetes mellitus (DM) leading to the blindness in the working-age population. Early diagnosis of DR is critical in preventing visual loss. The aim of our research was to evaluate the annual assessment for DR and the incidence of DR in type 1 (T1DM) and type 2 diabetes mellitus (T2DM) subjects at primary care level.

METHODS: A retrospective analysis of medical records covering the period from 2012 to 2013 year was performed in five largest public primary Vilnius outpatient clinics collecting data on basic patient characteristics, diabetes type and duration, diagnosed DR, referrals to ophthalmologist for retinal screening.

RESULTS: The study group of 1719 adult patients consisted of 92.6% of T2DM subjects and 58.9% of women. Diabetic patients were 64.4±13.4 years of age with average duration of diabetes of 8.1±6.9 years. The incidence of DR was 10.7% (50.0% in T1DM and 7.5% in T2DM)–, There were 42.8% of patients referred to ophthalmologist for retinal screening in 2012 (51.6 % T1DM, 42.1 % T2DM) and 43.0% of patients – in 2013 (56.3 % and 42.0 % respectively).

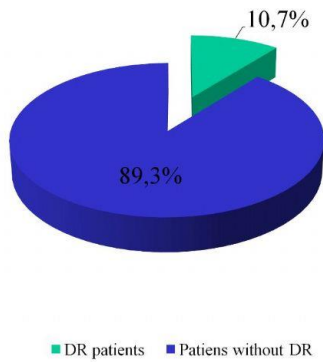

CONCLUSIONS: Our study revealed high prevalence of diabetic retinopathy and poor annual monitoring for diabetic retinopathy in patients with type 1 and type 2 diabetes at five largest Vilnius outpatient clinics. Family doctors should pay more attention for the management of diabetic retinopathy retinal screening and improve referrals to ophthalmologist for annual retinal screening.

Efficacy of the treatments for High Blood Pressure in a primary care center

Pedro Alejandro Gonzales Flores, Ione Veronica Mejia Ganoza

Catalan Health Institute, CAP Les Fontetes, Cerdanyola del Vallès, Barcelona, Spain

OBJECTIVES

1. To determinate the differents kinds of treatments for ther treatment of High Blood Pressure (HBP)
2. To determinate the effectiveness of the diferents treatments for HBP

METODOLOGY

Descriptive and retrospective study. Were chosen 80% (583) of patients with HBP of the Primary Care Center Les Fontetes (Cerdanyola del Vallès. Barcelona). We describe the main kinds of treatments and measure the effectiveness off them. Good control was measured using the Catalan Health Institute (ICS) and European Hypertension Society (EHS)

RESULTS

Prevalence of HBP was 46,3%. For the chosen populations, good control by ICS guide was 59,5% and 69,9% using EHS guide. For men the good control was 63,2% and 71,1% (ICS and EHS respectively) and for women 56,9% and 69,2% (ICS and EHS). The mains treatments were: ARA II+Diuretics 16,47%; ACEi + Diuretics 15,95%; ACEi (Angiotensin coverse enzyme inhibitors) 13,89%; ARA II 7,89%; Diuretics 5,83%; ARAII+Calcium antagonist+Diuretics 4,12%; Beta-blockers 3,95%; ARAII+calcium antagonist 3,77% and others 19,90%.

The degree of control using the ICS guide: ARA II+Diuretics 57,3%; ACEi + Diuretics 69,9%; ACEi 58,1%; ARA II 56,5%; Diuretics 61,8%%; ARAII+Calcium antagonist+Diuretics 66,7%%; Beta-blockers 60,87%; ARAII+calcium antagonist 66,7% and others 50,72%.

The degree of control using EHS was: ARA II+Diuretics 70,9%; ACEi + Diuretics 77,4%; ACEi 63,9%; ARA II 73,9%; Diuretics 70,9%; ARAII+Calcium antagonist+Diuretics 75%; Beta-blockers 82,6%; ARAII+calcium antagonist 77,3% and others 61,1%.

There were difference statistically significant in ARA II+Diuretic, ARA II, Beta-blockers, ACEi+Calcium antagonist and Calcium antagonist+Diuretic

CONCLUSIONS

1. There were so many kinds of treatments for treatment of HBP in our study.
2. There was not difference statistically significant between man and women.
3. The mains treatments were ARA II+Diuretics; ACEi + Diuretics and ACEi.
4. The degree of control of HBP was non-uniform.
5. The most efective treatments were: ARAII+Diuretic, ARA II, Beta-Blockers ACEi+Calcium antagonist and Calcium antagonist+Diuretic.

²Vilnius University Hospital Santariskiu Klinikos, Vilnius, Lithuania

³Karoliniskiu Outpatient Clinic, Vilnius, Lithuania

BACKGROUND AND AIM: Each country has its own policy on diabetes care but there is a lack of feedback how effective those strategies are in practise. The objective of our reaseach was to assess glycated hemoglobin (HbA1c) outcomes in relation to diabetes treatment.

METHODS: A retrospective analysis of medical records was performed at 5 largest outpatient clinics in Vilnius and included a randomly selected sample of 1719 type 1 diabetes (T1DM) and type 2 diabetes (T2DM) patients. Data from 2012 and 2013 year on patient basic characteristics, HbA1c, diabetes treatment strategy (diet, oral medications, insulin therapy, combined therapy) were collected.

RESULTS: Mean age of 1719 subjects was 64±13,4 years, female composed 58,9%. There were 7,4% of T1DM and 92,6% of T2DM subjects with average disease duration 8,13±6,9 years. Average HbA1c was 6,8±2,3 %: 8,6±2,6 % in T1DM and 6,6±2,1 % in T2DM. The target HbA1c of ≤7 % was reached in 57,6 % of subjects: in 13,3 % of T1DM and in 61,2 % of T2DM. The most of T2DM subjects - 72,2 % were treated with oral medications, 6,9 % - with diet, 11,6 % - with insulin, 9,1 % - with combination of insulin and oral agents. All T1DM patients were treated with insulin. T2DM patients treated with diet had HbA1c 6,1±0,1 %, with oral agents - 6,8 ±1,1 %, with insulin - 8,5 ±1,8 %, with combination of insulin and oral agents - 8,5 ± 1,5 %.

CONCLUSION: Good glycemic control at Vilnius outpatient clinics was achieved in the majority of T2DM patients treated with oral agents or diet, however situation worsened with insulin therapy. General practitioner faces a challenge in achieving glycemic goals in T1DM or T2DM subjects when insulin therapy is necessary with the progression of disease and have to put more efforts in achieving targets.

Keywords: diabetes treatment, glycated hemoglobin, primary care

Association between high risk alcohol consumption, hypertension in Korean people The Fifth Korea National Health and Nutrition Examination Survey (KNHANES V, 2010-2012)

Sun Hong Min, Ki Young Kwon, Hong Jun Cho, Jeong Ah Lee, Young Zu Kim

Department of Family Medicine, Asan Medical Center, University of Ulsan College of Medicine, Seoul, Korea

BACKGROUND: The purpose of this study was to investigate the association between high risk alcohol consumption and hypertension with representative sample in Korea.

METHODS: We used data from the Korean National Health and Nutrition Examination Survey, 2010-2012. The participants were aged 30 years and older, high risk drinking was divided into four groups: none, once a month, once a week and nearly daily. After adjusting for confounding factors, binomial logistic regression analysis was performed to assess the association between high risk drinking, hypertension

RESULTS: The prevalence of hypertension was 32.4% and the rate of high risk drinking was as follows: none = 36.1%; once a month = 30.3%; once a week = 26.0%; none = 7.6%. On binomial logistic regression analysis adjusting for confounding factors (age, body mass index, sex, hypercholesterolemia, household income, education status, physical activity, smoking status, DM and average daily alcohol consumption). A lineal association between the prevalence of hypertension and frequency of high risk drinking was found. Compared with non-risk drinking group, odds ratio (OR) (95% confidence interval, CI) for hypertension according to frequency of high risk drinking was as follows: once a month, OR = 1.280 (95% CI, 0.978-1.676); once a week, OR = 1.977 (95% CI, 1.559-2.228); nearly daily, OR = 2.341 (95% CI, 1.791-3.058).

CONCLUSION: This study shows that high risk drinking is associated with hypertension.

Anemia after gastrectomy in long-term survivors for gastric cancer

Ji Hye Jun¹, Jeong Ah Lee¹, Sung Sunwoo¹, Young Sik Kim¹, Byung Sik Kim²

¹Department of Family Medicine, Asan Medical Center, University of Ulsan College of Medicine

²Department of Stomach Surgery, Asan Medical Center, University of Ulsan College of Medicine

Background

Anemia is one of the frequent complications after gastrectomy in patients with gastric cancer. In this study, we would like to evaluate the incidence of anemia in long-term survivors from gastric cancer and important risk factors impacting on anemia.

Method

This study included 385 patients who visited the Cancer Prevention Clinic in the department of family medicine in Asan medical center from January 1, 2009 to December 31, 2014. All patients underwent curative gastrectomy and have been surviving over 5 years. We measured hemoglobin, iron, TIBC, Ferritin and Vitamin B 12 level before the surgery as well as at 5 annual follow up. Variables such as patients' sex, age at the time of surgery, education level, alcohol consumption, smoking, marital status, occupation, and body mass index (before and after surgery) are considered. We used logistic regression model to describe the probability of anemia (as well as iron deficiency and B12 deficiency) with various covariates listed above. Statistical significance of each covariate is tested and 95% confidence intervals for odds ratio are obtained.

Result

The study subjects consist of 258 males and 127 females (mean age, 53.2 years). Compared to the level before the surgery, there is a significant increase of the incidence of anemia 5 years after the surgery in all patients; 38 among male out of 258(14.7%), 37 among female out of 127(29.1%). The incidence of anemia has tended to increase over time after gastrectomy. In univariate analysis, patients with total gastrectomy, women, lower body weight at 5 year showed significantly higher compared to patients with subtotal gastrectomy at 5 year after gastrectomy (P =0.00086, P=2e-07, P=0.00033).

Conclusions

Anemia after gastrectomy has been increasingly occurred on long-term follow up after gastrectomy. Therefore, the regular evaluation of anemia is necessary to long-term gastric cancer survivors.

Keywords: Anemia, Gastrectomy, Gastric cancer

Prevalence of depression at general practitioners in Republic of Macedonia

Biljana Petkovska Ognjanova¹, Violeta Ognjanova², Stefan Arsov²

¹Doctor's Chamber of Macedonia

²PZU Urgenta

Background and OBJECTIVES: Due to the daily strain and stress at the work place the risk of depression is very high in the medical staff. Our aim was to measure the prevalence and the severity of underlying symptoms at the general practitioners in Republic of Macedonia.

METHODS: 298 General Practitioners were asked to perform PHQ9 depression self-assessment questionnaire. In which 9 symptoms were scored from 0-3 depending on their occurrence in the last 2 weeks.

RESULTS: The mean age of the subjects was 46 years of age, 88% were female and 30% worked in rural areas. The most commonly expressed depression symptom was tiredness and lack of energy. In 26% of subjects depression was present. In 20% of case it was subsyndromal depression, 3.5% had mild depression episode, 2.3% had moderately heavy depression episode whereas 0.8% had heavy depression episode. There was no correlation in the linear regression between the age, gender and location and severity of presence of depression. The independent predictors of the severity of depression were the 9 question from the questionnaire.

DISCUSSION: The prevalence of depression of general practitioners of 26% in Republic of Macedonia appears to be higher than the reported prevalence of around 10% of general population. The most common symptom was tiredness and lack of energy what indicated that the large work load can be one of the cause of the high prevalence of depression.

Keywords: depression, stress, general practitioner

PHQ9 questionnaire

Over the last 2 weeks, how often have you been bothered by any of the following problems?	Not at all	Several Days	More than half the days	Nearly every day
1. Little interest or pleasure in doing things	0	1	2	3
2. Feeling down, depressed, or hopeless	0	1	2	3
3. Trouble falling or staying asleep, or sleeping too much	0	1	2	3
4. Feeling tired or having little energy	0	1	2	3
5. Poor appetite or overeating	0	1	2	3
6. Feeling bad about yourself – or that you are a failure or have let yourself or your family down	0	1	2	3
7. Trouble concentrating on things, such as reading the newspaper or watching television	0	1	2	3
8. Moving or speaking so slowly that other people could have noticed. Or the opposite – being so fidgety or restless that you have been moving around a lot more than usual	0	1	2	3
9. Thoughts that you would be better off dead, or of hurting yourself in some way	0	1	2	3

Total Score: 1-4 Minimal depression; 5-9 Mild depression; 10-14 Moderate depression; 15-19 Moderately severe depression; 20-27 Severe depression

Presence of Depression at GPs

Should Human Chorionic Gonadotropine Treatment Increase Thyroid Volume?

Ayten Oguz¹, Dilek Tuzun¹, Murat Sahin¹, Numan Guvenc², Kamile Gul¹

¹Kahramanmaraş Sutcu Imam University School of Medicine, Department of Endocrinology and Metabolism, KAHRAMANMARAS, TURKEY

²Kahramanmaraş Sutcu Imam University School of Medicine, Department of Family Medicine, KAHRAMANMARAS, TURKEY

AIM: Our aim was to investigate the thyroid function tests and throid volume differences among isolated hypogonadotropic hypogonadism patients that take androgen replacement treatment.

MATERIAL-METHOD: 36 male patients with isolated hypogonadotropic hypogonadism with a mean age 33,2 (age,18-54) that diagnosed in Endocrinology and Metabolism Department between september 2013 and september 2014 and 40 healty control with a mean age 27,77 (age,18-55) were involved to study. Patient group was divided as testosterone treated patients (n=18) and human chorionic gonadotropin treated patients (n=18). Patient group was compared before and 6 months after treatment in terms of total testosterone, thyroid function tests (thyroid stimulating hormone, free thyroxine) and thyroid volume. Patient group was compared with control group as well.

RESULTS: When we compared the control group and patient group before treatment there was not any significant difference for age, BMI, TSH, ft4 and thyroid volume between 2 groups. When we compared the patient group before and after treatment there was not any difference for TSH and ft4 levels but testosterone levels and thyroid volume were significantly higher after treatment ($p<0.05$). When we compared the HCG-treated and testosterone-treated patients; thyroid volume was higher among HCG-treated patients ($p<0.05$) but there was not any difference for thyroid volume before and after testosterone treatment ($p>0.05$). Additionally, there was a statislically significant negative correlation between TSH and thyroid volume ($r=-0.195$, $p=0.039$).

CONCLUSION: Our study showed that androgen replacement treatment increases the thyroid volume and thyroid volume increased especially in HCG-treated patients. We suggest that thyroid volume changes should be considered in follow up among HCG-treated patients

Keywords: thyroid function, volume, hypogonadism, androgen replacement

Primary care providers' opinions about online self-management for well-controlled type 2 diabetes mellitus patients

Huberta Hart¹, Elke De Leeuw², Guy Rutten², Rimke Vos²

¹Leidsche Rijn Julius Health Centers, Utrecht, The Netherlands

²Julius Center for Health Sciences and Primary Care, University Medical Center Utrecht, The Netherlands

Background and AIM: To explore perceptions of primary care providers about an online self-management program for well controlled type 2 diabetes (T2DM) patients that replaces a greater part of regular care, and to assess the selection of eligibility of these patients in their own practice.

METHODS: An online self-management program was introduced in four primary healthcare centers. Well-controlled T2DM patients could get the opportunity to visit the practice once per year and to upload self-measured bloodglucose, blood pressure and bodyweight measures three-monthly. Patients will be contacted afterwards on indication. Well-controlled (both HbA1c, LDL-cholesterol and blood pressure) patients were selected from the Electronic Data Base. Primary care providers judged who of them were eligible for the self-

management program, and reported reasons for ineligibility. Patients' characteristics were compared and multivariable logistic regression was performed. Besides, the general practitioners and nurses received a questionnaire on online self-management in general.

RESULTS: Thirty six primary care providers participated. They considered 154 (54.6%) patients of 282 well-controlled T2DM patients eligible for self-management. Main reasons for ineligibility were 'language barrier' and 'cognitive impairment'. Odds for ineligibility were higher for older age (OR 1.05; 95%CI 1.03-1.08) and non-Western ethnicity (OR 4.18; 95%CI 1.77-9.90). In general, 32 primary care providers judged online self-management cost-effective (56.3%) and beneficial for patients (62.5%). The following categories of patients were considered to be capable of self-management: people with high compliance (90.3%) and health literacy (80.6%), being well-controlled for a longer period (61.3%) and with little comorbidity (6.5%). Most reported barriers for online self-management were poor health literacy (90%), cognitive impairment (83.3%), language barrier (83.3%) and low compliance (76.7%).

CONCLUSION: In general, primary care providers have positive perceptions about online self-management as alternative to regular care for well-controlled T2DM patients, but in practice they consider a high proportion of patients ineligible for online self-management.

Keywords: self management, type 2 diabetes mellitus, primary care providers

Reasons for ineligibility as judged by the GPs in 128 patients

	Number of patients
Language barrier	25 (19.5%)
No more well-controlled	23 (18.0%)
Cognitive impairment	23 (18.0%)
No computer/ internet	14 (5.0%)
Low compliance	12 (4.3%)
Comorbidity	11 (3.9%)
Complications	8 (2.8%)
Out of care	6 (2.1%)
SIMMS > 1	4 (1.4%)
Passed away	2(0.7%)

Diagnosis and treatment of Chlamydia trachomatis infection- case report

Etela Janeková

InClinic s.r.o, Internal medicine and GP, Bratislava, Slovakia

Background & AIM: It is not just a disease that is occurring in developed countries. It is a disease occurring even in countries with highly developed economy and because of numerous antibiotic treatments, inflammatory diseases, not fully treated diseases and ongoing diseases.

The Chlamydia trachomatis infection often affects the urogenital tract in men and it manifests as dysuria, when short-lived and untreated progresses to epididymitis. With women there often occurs an asymptomatic, or with non-specific symptoms of an inflammatory disease. In both cases, usually, the true origin of the disease is not thought of and the disease leads to a chronic phase with the development of Reiter's syndrome and reactive arthritis, which is accompanied by urethritis (cervicitis in women), conjunctivitis, and a few aspects of painful musculoskeletal lesions. The disease develops in a few years spent with Chlamydia trachomatis. Often identified by medical history as Reiter's syndrome.

METHODS: The case study evaluated the disease in 11 patients who were not diagnosed in time and came to seek treatment for the pain of one or more joints (in most cases monoarthritis of the knee) and not for infections

of the urogenital tract. All patients were diagnosed with eye diseases such as conjunctivitis and/or keratoconjunctivitis.

RESULTS: The patients were treated, as well as their partners, given that it is an STD (sexually transmitted disease).

CONCLUSIONS: An important step in halting the spread of such an infection is an appropriate prevention, which consists of education, identification of asymptomatic ev. oligosymptomatic patients, effective diagnosis and treatment, and the treatment of sexual partners.

Keywords: chlamydia trachomatis, Reiter's syndrome, STD

Trachoma

Chronic bilateral follicular conjunctivitis and keratoconjunctivitis in untreated ev. relapsed transfer occurs in the deeper structures of the eye with the emergence of the entropy of a corneal ulcer.

Individual Representations about Their Illness in End-Stage Renal Disease Patients Undergoing Hemodialysis

Aysen Kutan Fenercioglu¹, Ergun Simsek², Sibel Kosucu³, Huseyin Demirbilek²

¹Department of Family Medicine, Baskent University Medical Faculty, Istanbul Hospital, Istanbul, Turkey

²Hemodialysis Unit, Baskent University Istanbul Hospital, Istanbul, Turkey

³Nursing Services, Baskent University Istanbul Hospital, Istanbul, Turkey

AIM: To explore the impact of end-stage renal disease (ESRD) on individual illness representations including seven symptoms; time-line (acute/chronic), illness identity, cyclical symptoms, consequences, treatment control, coherence and emotional response.

MATERIALS-METHODS: This study employed a cross-sectional design. The participants in this study included 41 patients with ESRD who were undergoing hemodialysis treatment. Participants were assessed using 38 questions of Revised Illness Perception Questionnaire (IPQ-R) that address seven subscales. The patients rated the items on a five point scale, ranging from strongly disagree to strongly agree. Data were analyzed with NCSS (Number Cruncher Statistical System) 2007 Statistical Software program. Kruskal-Wallis one way variance analysis was used to analyze the differences between the groups. Pearson correlation test was used to analyze differences of emotional representations with age, disease onset age, employment and education. P value <0.05 was accepted as statistically significant.

RESULTS: In this study, the alfa coefficients for all subscales of patients' individual representations were between 0.782 and 0.835 compared to the alfa coefficients for subscales of individual illness representations of Turkish population which were between 0.69-0.77 as indicated in the validity and reliability study of the test. The correlations between the age, education level, employment status of the patients and the 7 subscales of illness representations didn't show any statistically significant result (p>0.05). Only, there was a statistically significant correlation in a negative direction between the disease onset age and the patient's coherence to their illness (r=0.343, p=0.03).

CONCLUSION: In ESRD, hemodialysis patients' individual representations to their illness didn't show significant changes at any age, education level and employment status. Besides, as the disease onset age increased, patients' coherence to their illness decreased. Young hemodialysis patients were able to understand and make sense of their disease quite well compared to baseline.

A rare disease common in our region: Sickle Cell Disease Review and Recommendations for Primary Care

Aslı Korur, Çiğdem Gereklioğlu, Süheyl Asma

Department of Family Medicine, Başkent University, Adana, Türkiye

Background&AIM: Sickle cell disease (SCD) is a chronic hematological disorder characterized by sickled erythrocytes mediating microvascular occlusion, hemolytic anemia and jaundice. Although SCD is a hematological disorder, many patients are forced to rely on primary care providers (PCPs) for medical management of their SCD. **METHOD:** A selective search and review of the current literature on SCD and the authors' experience. **RESULTS:** Management of individuals with SCD is very complex requiring a multidisciplinary approach that should

involve the patient and the family. Newborn screening for SCD is now mandatory in our country, as well as in most states where SCD is prevalent. SCD is diagnosed in all age groups by hemoglobin electrophoresis or DNA analyses. In SCD, thrombosis and infarction caused by vasoocclusion of large and small blood vessels often results in acute and chronic organ damage. Frequent complications are anemia, vaso-occlusive pain episodes, febrile illness, cerebrovascular accident, acute splenic sequestration, acute chest syndrome, pulmonary hypertension, aplastic crisis, priapism, retinopathy, renal disease and leg ulcers. Red blood cell transfusion therapy and hydroxyurea are the major options available for patients in the treatment and prevention of complications. Hematopoietic stem cell transplantation is the only curable treatment option today which has begun to be performed in our centre.

CONCLUSIONS: PCPs are now in era of increased routine screening, assessment and management of chronic complications from this illness not previously seen in the care of adults with SCD. Holistic approach is critical for management of SCD patients who may usually be neglected at primary care setting. Therefore, PCPs should be aware of this rare disease which is common in our country.

Causal Attributions of the Hemodialysis Patients for the Onset of End-Stage Renal Disease

Aysen Kutan Fenercioglu¹, Ergun Simsek², Sibel Kosucu³, Huseyin Demirbilek²

¹Department of Family Medicine, Baskent University Medical Faculty, Istanbul Hospital, Istanbul, Turkey

²Hemodialysis Unit, Baskent University Istanbul Hospital, Istanbul, Turkey

³Nursing Services, Baskent University Istanbul Hospital, Istanbul, Turkey

AIM: To explore the possible causal attributions (psychological factors, life style, chance, hereditary and environmental risk factors) of the hemodialysis patients for the onset of End-Stage Renal Disease (ESRD).

MATERIALS-METHODS: This study employed a cross-sectional design. The participants in this study included 41 patients with ESRD who were undergoing hemodialysis treatment. Participants were assessed using 18 questions of Cause Subscale of the revised Illness Perception Questionnaire (IPQ-R). The patients rated the items on a five point scale, ranging from strongly disagree to strongly agree. Data were analyzed with NCSS (Number Cruncher Statistical System) 2007 Statistical Software program (Utah, USA). Kruskal-Wallis one way variance analysis was used to analyze the differences between the groups. Pearson correlation test was used to analyze correlation of causal attributions with age, employment status and education. P value <0.05 was accepted as statistically significant.

RESULTS: In this study, the alfa coefficients for all subscales of patients' causal attributions about their illness were between 0.816 and 0.887 compared to the alfa coefficients for causal attributions of Turkish population which were between 0.25 and 0.72 as indicated in the validity and reliability study of the test. The correlations between the patients' age, disease onset age, hemodialysis age, education level of the patient, the employment status of the patient and the subscales of causal attributions about their illness didn't show any statistically significant result ($p>0.05$). The most common causal attribution was psychological factors and the least common causal attribution was chance.

CONCLUSION: In ESRD, hemodialysis patients' causal attributions about their illness didn't show significant changes at any age, education level and employment status. Most of the patients had believes that the disease occurred because of their psychological risk factors. The belief that the disease occurred by chance was the least possible causal attribution.

Profile of NSAIDs prescription in patients with ischaemic heart disease in a metropolitan city

Alejandro Leganes Ramos¹, Ana Gangoso Feroso², Laura Portillo Horcajada², Ana Villimar Rodriguez², Sonia Soto Diaz², Lourdes Martin Mendez²

¹Hospital Universitario Fundación Alcorcón, Alcorcón, España

²Dirección Asistencial Oeste, Servicio Madrileño de Salud, Mostoles, España

Background and AIM: NSAIDs must be used carefully in patients with ischaemic heart disease (IHD). We aimed to assessment the prescription of NSAIDs in patients with (IHD) in a metropolitan city with seven primary care health centers and compare with the agencies' recommendations in IHD that position as safer NSAID naproxen, followed by ibuprofen, and position selective COX-2 (coxib) as contraindicated.

METHOD: A descriptive cross-sectional study in patients 14 aged and over with active episode of IHD in the clinical history with CIAP code K74 (ischaemic heart disease with angina), K75 (acute myocardial infarction) and K76 (ischaemic heart disease without angina) with at least one dispensation of NSAIDs (period: September 2013-August 2014). Variables collected: sex, age, CIAP code, date of episode and dispensation, kind of NSAIDs, dosage, number of dispensed packages and use of NSAIDs in general population. The databases Consutaweb® and Farm@drid and statistic program Epidat 3.1 were used.

RESULTS: Of the 141,285 population studied, 3,563 patients (2.52% 95%CI: 2.11-2.94) have IHD. 896 of them (25.15% 95%CI: 22.36-27.93) had at least one dispensation of NSAIDs, the median age was 68.9 ± 11.8 years and 65.07% were male. The odds ratio of the NSAIDs prescription between patients with or without IHD was 0.91 (95%CI: 0.84-0.98 p=0,01). In patients with IHD, the total packages of NSAIDs dispensed was 2,083 (2.3 package/patient 95%CI: 1.95-2.70). The profile of NSAIDs use was: ibuprofen (51.03%), dexketoprofen (16.03%) coxib group (11.67%) and Naproxen (6.96%). Most of the patients (54,64%) had only one dispensation, and 12,74% had at least 4.

CONCLUSIONS: Despite the recommendations, the prescription of NSAIDs in patients with IHD is common and similar to general population, even though it seems to be used in short treatments. The profile should get better, because of the high use of coxib and low use of naproxen.

The Comparison of Illness Perception Between Breast Cancer Patients and Other Cancer Patients

Sevsen Cebeci¹, Elif Akyol², Gül Eren², Dilek Önler², Müzeyyen Arslan², Metin Canbal¹

¹Department of Family Medicine, Turgut Ozal University, Ankara, Turkey

²Turgut Ozal University School of Nursing, Ankara, Turkey

AIM: Patients cluster their ideas about an illness around five coherent themes or components. These components together make up the patient's perception of their illness. The components provide a framework for patients to make sense of their symptoms, assess health risk, and direct action and coping. Each of these components holds a perception about one aspect of the illness and together they provide the individual's coherent view of an illness.

METHOD: The research sample was conducted in 106 outpatient treatment patients in Dr. Abdurrahman Yurtaslan Oncology Education and Research Hospital services which is located in the center of Ankara, who were treated between November 2013 May 2014. Questionnaire containing patient characteristics and Illness Perception Scale was used to collect the data.

RESULTS: In our study treatment control and duration (cyclic) subscale scores were found to be higher in patients with breast cancer compared to other cancer patients ($p=0,000$, $p=0,041$). Breast cancer patients have lower ascription points of lifestyle than other cancer patients ($p=0,013$). Chance factors, physical factors, treatment control subscale scores were higher in patients with a family history than those without a family history ($p<0,05$) Treatment control subscale scores in housewives were higher than other occupational groups, external ascription and lifestyle ascription subscale scores were lower ($p<0,05$).

CONCLUSION: A strong belief that the illness can be cured or controlled is typically associated with short perceived illness duration and relatively minor consequences. In contrast, beliefs that an illness will last a long time and has a number of symptoms tend to be associated with more severe consequences perceptions and lower beliefs about cure or control of the disease.

Annual Foot Screening in Type 1 and Type 2 Diabetes Subjects at Vilnius Primary Care Outpatient Clinics in 2012 – 2013

Dalia Palisaityte¹, Zdrune Visockiene¹, Laura Siaulienė³, Daura Raudonyte¹, Estera Muchlyte¹, Asta Sakaite¹, Monika Niedvaraitė¹, Margarita Lasevic¹, Rima Povilioniene¹, Ruta Baneviciute Domarkiene¹, Roma Puronaite², Vytautas Kasiulevicius¹, Virginijus Sapoka¹

¹Vilnius University, Faculty of Medicine, Vilnius, Lithuania

²Vilnius University hospital Santariskiu klinikos, Vilnius, Lithuania

³Karoliniskiu Outpatient Clinic, Vilnius, Lithuania

Background and AIM:

Annual foot examination doesn't require laboratory or instrumental resources, however, provided regularly, helps to early diagnose diabetic polyneuropathy and peripheral angiopathy. The aim of study was to assess the annual foot examination in type 1 diabetes mellitus (T1DM) and type 2 diabetes mellitus (T2DM) subjects during primary care visits.

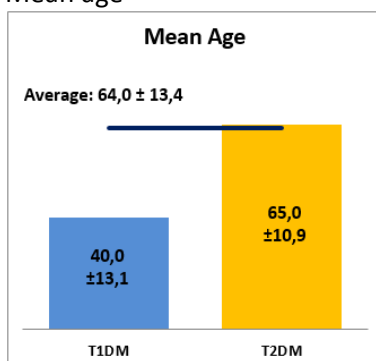

METHODS: A retrospective data from clinical notes on basic patient characteristics, disease duration, long-term glycemic control, diabetes complications - polyneuropathy, angiopathy, annual foot screening, tobacco use, covering the period from 2012 to 2013 inclusively, were collected at five largest Vilnius primary care outpatient clinics.

RESULTS: A randomly selected sample of 1719 subjects included 128 (7,4%) T1DM and 1591 (92,6%) T2DM subjects. The average age was $64,0 \pm 13,4$ years ($40,0 \pm 13,1$ T1DM; $65,0 \pm 10,9$ T2DM);, disease duration – $8,13 \pm 6,94$ years ($16,82 \pm 11,49$, T1DM; $7,49 \pm 5,92$, T2DM), and HbA1c – $6,82 \pm 2,34\%$ ($8,67 \pm 2,63$, T1DM; $6,67 \pm 2,14$ T2DM). Only 317 subjects (18,4%) were screened for tobacco use: there were 230 non-smokers (72,56%) and 87 (27,44%) smokers. Annual foot examination during primary care visit was performed only in 17,3% of subjects (21,9% T1DM; 16,9% T2DM). Diagnosis of angiopathy was recorded in 7,74% (13,28% T1DM, 7,29% T2DM), polyneuropathy - in 36,18% of cases (69,53% T1DM, 33,5% T2DM).

CONCLUSION: Study results show good long-term glycemic control especially in T2DM subjects, however annual screening for diabetes complications – polyneuropathy, angiopathy – providing simple exam of the feet is clearly insufficient, as during primary care visit is performed for less than one fifth of all subjects. It could be presumed that the estimated rate of angiopathy and polyneuropathy would be even higher if all subjects have annual foot examination. These results urge for implementation of long term strategy at the primary care level to improve comprehensive follow-up for diabetes complications.

Patient and disease characteristics associated with activation for self-management in patients with a chronic disease: a cross-sectional survey study

Irene Bos Touwen¹, Marieke Schuurmans¹, Evelyn Monninkhof², Yvonne Korpershoek¹, Lotte Spruit Bentvelzen¹, Inge Ertugrul De Graaf¹, Niek De Wit², Jaap Trappenburg¹

¹Department rehabilitation, nursing science & sports, University Medical Centre Utrecht, Utrecht, The Netherlands.

²Julius Center for Health Sciences and Primary Care, University Medical Centre Utrecht, Utrecht, The Netherlands

Background & Aim A substantial proportion of chronic disease patients do not respond to self-management interventions, which suggests that one size interventions do not fit all, demanding more tailored interventions. To compose more individualized strategies, we aim to increase our understanding of characteristics associated with patient activation for self-management and to evaluate whether these are disease-transcending.

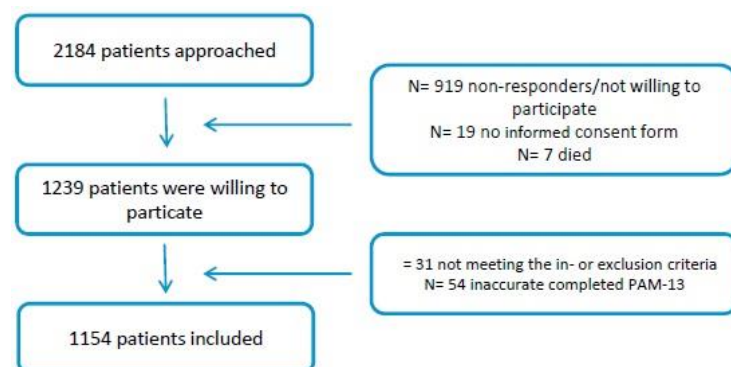

Methods A cross-sectional survey study was conducted in primary and secondary care in patients with type-2 Diabetes Mellitus (DM-II), Chronic Obstructive Pulmonary Disease (COPD), Chronic Heart Failure (CHF) and Chronic Renal Disease (CRD). Using multiple linear regression analysis, we analyzed associations between self-management activation (13-item Patient Activation Measure; PAM-13) and a wide range of socio-demographic, clinical, and psychosocial determinants. Furthermore, we assessed whether the associations between the determinants and the PAM were disease-transcending by testing whether disease was an effect modifier. In addition, we identified determinants associated with low activation for self-management using logistic regression analysis.

Results We included 1154 patients (53% response rate); 422 DM-II patients, 290 COPD patients, 223 HF patients and 219 CRD patients. Mean age was 69.6±10.9. Multiple linear regression analysis revealed 9 explanatory determinants of activation for self-management: age, BMI, educational level, financial distress, physical health status, depression, illness perception, social support and underlying disease, explaining a variance of 16.3%. All associations, except for social support, were disease transcending.

Conclusion This study explored factors associated with varying levels of activation for self-management. These results are a first step in supporting clinicians and researchers to identify subpopulations of chronic disease patients less likely to be engaged in self-management. Increased scientific efforts are needed to explain the greater part of the factors that contribute to the complex nature of patient activation for self-management.

²Vilnius University Hospital Santariskiu Klinikos, Vilnius, Lithuania

³Karoliniskiu Outpatient Clinic, Vilnius, Lithuania

BACKGROUND AND AIM: information on long-term diabetes mellitus (DM) patients management is lacking. We aimed to assess the long-term control of type 1 diabetes mellitus (T1DM) in relation to disease duration and number of complications in Vilnius.

METHODS: a retrospective analysis of medical records was performed at five largest Vilnius primary outpatient clinics collecting data from 2012 to 2013 year inclusively. Target glycated hemoglobin (HbA1c) was $\leq 7\%$. Diabetes duration was classified into 5 categories: 0-5, 6-10, 11-15, 16-20, >20 years. Patients were divided into groups according to number of complications they had: 0, 1, 2, 3 and 4.

RESULTS: There were 128 T1DM subjects included in the study. The average HbA1c was $8,7 \pm 2,6\%$.

Target HbA1c $\leq 7\%$ was reached in 13,3% of patients. The lowest HbA1c of $8,1 \pm 2,6\%$ was reached in a group with T1DM duration of 6-10 years. HbA1c in disease duration of 0-5 years was $9,5 \pm 2,03\%$, 11-15 years - $8,4 \pm 4,0\%$, 16-20 years - $9,8 \pm 1,9\%$, >20 years - $8,6 \pm 2,3\%$. The lowest HbA1c of $6,9 \pm 1,4\%$ was reached in patients with 4 complications; the highest - $9,0 \pm 2,2\%$ - in a group with 2 complications. Patients without complications had HbA1c $7,7 \pm 3,7\%$, 1 complication - $8,9 \pm 1,7\%$, 3 complications - $8,9 \pm 3,0\%$.

CONCLUSIONS: The results showed insufficient long-term glucose control in most of T1DM subjects.

Poor control was estimated at the very beginning of disease and then with an increase of disease duration.

Complications also worsened glycemic control, with the tendency of HbA1c increase with the number of complications. Although there are some limitations of study due to small number of subjects, the overall tendency supports the need for care improvement in T1DM subjects.

Control levels of blood pressure among a group of people with hypertension in a health clinic

José Carlos Perez Sánchez, Nayade Jorge Matin, Maria Ángeles Castaño Fuentes, José Ángel Sánchez Ortiz, Estela Diaz Sánchez, Rocio Gil Ruiz
Andalusian Health Service

OBJECTIVE: Study the level of control of a group of people with hypertension and its relation to variables such as gender, anthropometric index, diastolic and systolic arterial tension, tobacco consumption and use of anti hypertension medication by each patient.

MATERIAL-METHODS: Random data samples taken from 16 rural health clinics. Samples were taken from 166 patients who were measured according to age, sex, weight, size arterial tension, bodily mass index (BMI), tobacco, glycemia, cholesterol and quantity of anti hypertension medication consumed on average, standard derivation, **RESULTS:** The data was collected from 166 individuals, 74 men and 92 woman with an average age of 63, 28 weight 81,26, was it.size 163, bodily mass index 30,60, systolic arterial tension 134, diastolic arterial tension 79,72, glycemia 107,9, cholesterol 219,7, tobacco 3,13, patients controlled for arterial tension 124 and those who were not controlled 42. The number of medications taken per patient ranged from: 0 medications (11 patients), 1 medication (65 patients), 2 medications (56 patients), 3 medications (26 patients), 4 medications (8 patients). No significant difference was found between the non controlled groups and the groups controlled for weight, waist-size, BMI, age, glycemia, cholesterol and tobacco, but a significant difference was found by those controlled for diastolic and systolic arterial tension. Having studied the degree of control according to the number of medications, no dependency was found using contingency tables, analyzing if there existed a correlation between control and type of medication was only significant for control and treatment with calcium blockers.

ARGUMENT: There's a high percentage of non controlled patients, almost a third and a average of systolic arterial tension close to the limit just as the limit of weight, BMI, glycemia, and high cholesterol. It's also attention calling the absence of personal history records of the treatment of 11 patients and the independence between control and number of medications.

Variations in Lipid Screening Frequency in Family Medicine Patients with Cardiovascular Risk Factors

Yusuf Cetin Doganer¹, James Rohrer², Kurt Angstman², Stephen Merry², Jacob Erickson²

¹Department of Family Medicine, Turkish Military Academy, Primary Care Examination Center, Ankara, Turkey

²Department of Family Medicine, Mayo Clinic, Rochester, Minnesota, USA

Background & AIM: Over-testing for lipid levels in family medicine has been identified by the Choosing Wisely initiative of the American Board of Internal Medicine (ABIM) Foundation as a target for intelligent cost reduction in the U.S. This study was undertaken to assess the frequency of lipid screening in comparison to the United States Preventive Services Task Force (USPSTF) guideline in a sample of family medicine patients. In addition, we sought to determine the association between testing frequency and achievement of lipid targets.

METHODS: A random sample was extracted of 271 patients from among all patients cared for in our Department of Family Medicine for whom lipid screening was ordered from March to September, 2012 and who had ≥2 well-defined cardiovascular risk factors. Lipid testing frequency was classified in three ways: semi-annual or less often (0-12 tests over 6 years), annual or less often (0-6 tests), or biennial (0-3 tests).

RESULTS: Multiple logistic regression analysis revealed that the predictors of lipid screening more often than semiannually were age ≥60 years (OR=3.7) and diabetes mellitus (DM) (OR=30.6). Predictors of screening more often than annually were DM (OR=4.3), hypertension (OR=2.1), family history of premature coronary artery disease (CAD) (OR=5.6), and statin treatment (OR=3.5). Lipid goal attainment was not associated with testing frequency except in regard to low-density lipoprotein (LDL) levels (p=0.043, p<0.001, p=0.005 by semi-annual, annual, biennial, respectively) and total cholesterol levels (p=0.015, p=0.025 by semi-annual, annual, respectively).

CONCLUSIONS: Questionably high frequency of lipid testing was detected even when the more conservative approach of annual monitoring was assumed. Frequency of testing was not associated with goal attainment for most parameters. Physicians should request the lipid testing based on overall risk assessment, treatment goal achievement and person variability in accordance with published guidelines.

"{"Research of the Frequency of Metabolic Syndrome in Patients with rheumatoid arthritis and spondyloarthropathies"}"

Ezgi Agadayı¹, Fatma Gul Yurdakul², Sitki Agadayı², Hatice Bodur², Rabia Kahveci¹, Adem Ozkara¹

¹Department of Family Medicine, Ankara Numune Education and Research Hospital, Ankara, Turkey

²Department of Physical Therapy and Rehabilitation, Ankara Numune Education and Research Hospital, Ankara, Turkey

""Background and AIM: Metabolic syndrome (MS) is a disease which involves components of low HDL levels, elevated plasma glucose and triglyceride levels, central obesity, hypertension. Rheumatoid arthritis (RA) is a chronic, inflammatory, systemic disease whose etiology is unknown. Spondyloarthropathies (SpA) is a group of diseases that associated with HLA-B27 with articular and extra-articular symptoms. Chronic inflammation is considered to play a role in metabolic disorders and vascular disorders. It is thought that proinflammatory cytokines could conduce to development of hypertension, atherosclerosis and peripheral insulin resistance. Results indicate that the MS may be associated with inflammatory rheumatic diseases. In this study we investigated the prevalence of MS in inflammatory diseases.

METHODS: Patients with a diagnosis of RA and SpA and without any inflammatory disease were included in the study. Patients' demographic characteristics, waist circumference, height and weight, blood pressure and biochemical laboratory analysis were recorded. MS was diagnosed according to the NCEP ATPIII 2005 criteria. **RESULTS:** Study were included 97 patients (RA: 49, SpA: 21, Control: 27) until March 10, 2015. According to other groups, SpA patients were younger and male patient ratio was higher. Blood pressure measurements were higher in RA patients. BMI, waist circumference and MS (RA: 44.9%; SpA: 47.6%; control group: 59.3%) was not statistically different between the groups. **CONCLUSIONS:** In the literature, waist circumference, blood pressure and plasma glucose levels were shown higher in patients with RA. Prevalence of MS in RA patients has been reported ranging 20% to 42% and prevalence of MS in RA patients is higher than healthy controls. In a study included patients of RA, AS, PsA, frequency of MS was reported as %20- %11- %38, respectively. In our data, there is no difference between the groups in prevalence of MS. Study is ongoing. Diabetic autonomic neuropathy

Diana Dominguez Jimenez¹, Maria Angeles Moreno Fontiveros², Carmen Maria Cortes Salazar³

¹Doctor trainee at theHealth Centre of Estepa, Sevilla

²Family doctor at theHealth Centre of Estepa, Sevilla

³Family doctor at theHealth Centre of Badolatosa, Sevilla

BACKGROUND: As doctors of primary care it is basic for our daily practice to know our patient and the chronic diseases most frequent to provide a good practice.

CASE: Female 68 years. She's been suffering of constipation for several years. The last 4 months, she refers episodes of diarrhea that last 1-2 days, especially at night. This episodes has been more frequent this last week. She does not refer fever or other symptoms.

Abdomen: depresible, not signs of peritoneal irritation. Not painful to palpation.

Blood test: All result normal, except for glucose: 256 mg/dl, and glycohemoglobin 10.2%.

After a few interviews with the patient to check the evolution, the absence of alarm signs and symptoms, and the personal history of the patient: Diabetic since 10 years, that in the last 2 years has been with bad glucose control, with sensitive and motor neuropathy since then. We diagnose her of diabetic autonomic neuropathy and focus on glucose level control.

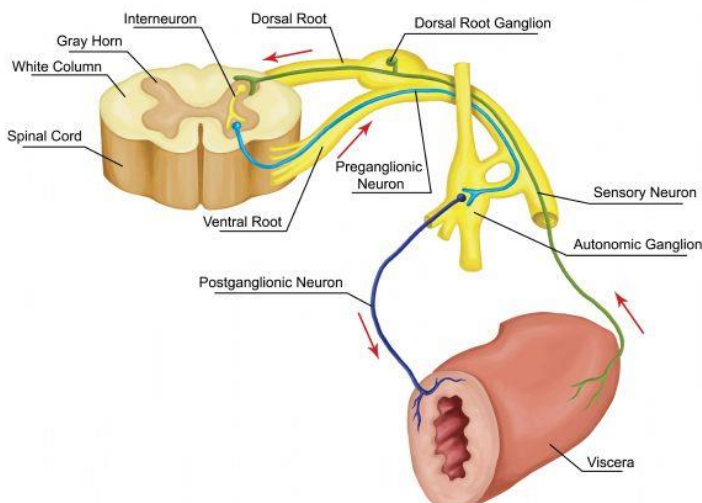

DISCUSSION: Diabetic autonomic neuropathy (DAN) is among the least recognized and understood complications of diabetes despite its significant negative impact on survival and quality of life in people with diabetes. DAN can involve the entire autonomic nervous system: cardiovascular, gastrointestinal, genitourinal and genitourinary, sudomotor, or ocular. Usually It is subclinical.

The gastrointestinal symptom most frequent is constipation. This can be interrupted for episodes of diarrhea, especially at night. The cause of this episodes of diarrhea are overgrowing bacterias and malabsorption of bile salts, so it can be treated with broad spectrum antibiotics. The constipation can be treated with supplements of fiber or metoclopramide.

Evolution: After speaking with the patient highlighting the importance of a good glucose level control, making some changes in her life style and the treatment, the patient normalized glucose level in 4 months. Since then she has been practically asymptomatic.

Importance of AGE variable in a study of type 2 diabetes and knowledge of the disease in a rural area

Jose Antonio PASCUAL Lopez¹, Pedro María Martínez López¹, Maria Ros Marin¹, Alfredo Pérez Carrillo¹, Concepción Martínez Delgado¹, Javier Aracil Fernández¹, María Dolores Vazquez García², Jose Alcibiades Duran Aaron¹, Francisco Javier Fernández Valero¹, Noelia Benítez Samuel¹, Juana Noelia López Pastor¹, Andres Egea Huertas¹, Miguel Angel Asmat Segura¹, Hebab Saas Bob Bachir¹, Maria Huertas Vidal Gimenez¹, Monica Michelle Arcos Rivera¹

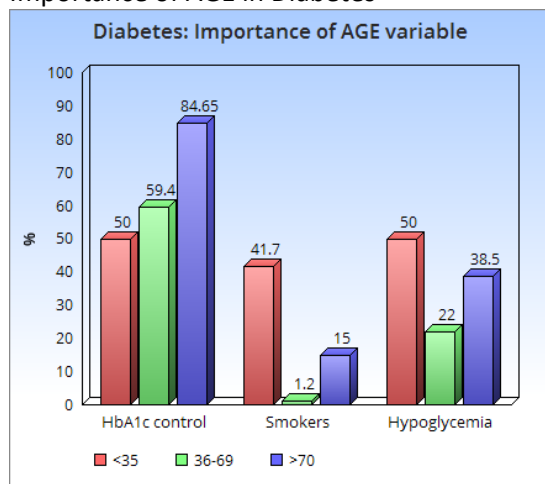

¹Centro de Salud de Calasparra. Gerencia del Noroeste. Servicio Murciano de salud. Murcia. Spain.

²Centro de Salud Barrio del Progreso. Gerencia Area VII. Servicio Murciano de Salud. Murcia. Spain.

- **Background & AIM:** To determine the relevance of the AGE of our diabetic population, control and knowledge of the disease:
- **METHOD:** Quality assurance methodology. Rural Field. Simple random sampling. We collect clinical-analytical biographical data (grouped by age > 35 years old, 36-69, > 70 and frail elderly people), - and we appreciate their understanding of the disease using a validated test, the adherence to treatment by Morinsky- Green test, the family support and the belonging to a diabetes group. G-Stat statistical software. Chi-square.
- **RESULTS:** Fasting Plasma Glucose Control: worse in the population of 36-69 years old, in the rest of the population, the distribution is homogeneous. HbA1c control: 50% (<35 years old), 59.4% (36-69), 84.65% (> 70) and 100% (frail elderly people). Control LDL-cholesterol is worse in <35 years old. Smokers: 15% (> 70), 41.7% (<35) and 1.2% (36 and 69). Hypoglycemia: 50% (<35), 25% (36-69) 11.5 (> 70). Adequate knowledge of the disease. 50% (<35), 22% (36-69) 38.5% (> 70). The rest of the strip of population (intermediate and inadequate) is more homogeneous. The belonging to a diabetes group: 25% (<35), in other ages is practically nil.
- **CONCLUSIONS:** The Age appears as a statistically significant factor in the control of HbA1c levels (probably for different purposes according to age), the percentage of smokers, the risk of hypoglycemia and the belonging to a diabetes group. The other measured variables, including the knowledge of the disease or ad the adherence are not statistically significantly conditioned by age. Knowing the importance of early monitoring we must intensify our efforts in the youngest population.

COPD guidelines and inhaled corticosteroids. Do we prescribe them correctly in Primary Care?

Xavier Flor¹, Silvia Alvarez¹, Sara Davies¹, Albert Brau¹, Amparo Hervás², Núria Sánchez²

¹Institut Català de la Salut

²CAPSE

AIMS: 1. To determinate the number of patients that are being correctly treated with inhaled corticosteroids (IC) according to the stage and the different guides

2. To determinate the percentage of patients treated correctly according to the stage, severity and the guide used (GOLD or GesEPOC)

METHODS: Multicentric transversal study in Barcelona city. A total of 401 patients diagnosed of COPD and with FEV1/FVC post-bronchodilatation < 0,70 in spirometry test, from 6 primary care centres, were included. The treatment prescribed to the patients was analysed and compared to the recommendations given in both guides. Statistical bivariate analysis was performed.

RESULTS: If we analyse the IC treatment according to GOLD's classification, the highest percentage of prescribed IC is in stage B (81,5%). Although, if we analyse it according to GesEPOC's classification, the highest percentage is in phenotype D (80%). The adequacy of prescribed treatment according to GOLD's guide is correct in 89,5% of the patients in stage B. On the other hand, according to GesEPOC's guide, 70,6% of phenotype C patients have IC correctly prescribed.

CONCLUSIONS: 1. According to GOLD's guide, there's a high percentage of patients in mild and moderate stages who should not have IC prescribed. Regarding GesEPOC's guide, the same happens with phenotype A patients. There is a correct adequacy of prescribed IC in the other stages and phenotypes.

2. Globally, we can observe a better treatment adequacy in mild and very severe stages according to GOLD's guide, and phenotypes A and C in accordance to GesEPOC's guide

GesEPOC	Non exacerbator phenotype	Mixed COPD-Asthma phenotype	Exacerbator with emphisema phenotype	Exacerbator with chronic bronchitic phenotype
IC prescribed	30,3% (89/294)	69,8% (30/43)	58,8% (10/17)	80% (36/45)
IC not prescribed	69,7% (205/294)	30,2% (13/43)	41,2% (7/17)	20% (9/45)
GOLD	A	B	C	D
IC prescribed	20,7% (37/179)	41,4% (41/99)	81,5% (22/27)	69,5% (66/95)

IC not prescribed	79,3% (142/179)	58,6% (58/99)	18,5% (5/27)	30,5%(29/95)
-------------------	-----------------	---------------	--------------	--------------

GOLD A and B should not take IC - 100% of mixed COPD-asthma phenotype should take IC - 47,1% of the exacerbators with emphysema phenotype and 55,6% of the exacerbators with chronic bronchitis should take IC

Percentage of patients well treated according to guidelines ans stage

GesEPOC	% well treated	GOLD	% well treated
Non exacerbatos phenotype	50,5% (149/295)		
- Mild	56,3% (133/236)		
- Moderate	26,1% (12/46)	A	58,3% (105/180)
- Severe	33,3% (4/12)		
- Very severe	0% (0/1)		
Mixed asthma-COPD phenotype	47,7% (21/44)		
Mild	46,2% (12/26)		
Moderate	52,9% (9/17)	B	33,3% (33/99)
Severe	0% (0/1)		
Very severe	0% (0/0)		
Exacerbator with emphisema phenotype	70,6% (12/17)		
Mild	60% (3/5)		
Moderate	85,7% (6/7)	C	44,4% (12/27)
Severe	50% (1/2)		
Very severe	66,7% (2/3)		
Exacerbator with chronic bronchitics phenotype	44,4% (20/45)		
Mild	6,7% (1/15)		
Moderate	42,9% (6/14)	D	89,5% (85/95)
Severe	81,8% (9/11)		
Very severe	80% (4/5)		

Baseline treatment vs recomended by guidelines

- The concordance between the baseline treatment and the recomended by GOLD guidelines is moderate (K=0,47); while in GesEPOC is low (k=0,366). - The concordance between both guidelines is about 73,41%, which means a kappa index of 0,58 (moderate concordance).

Healthcare improvement through the new technologies: Diabetic Retinopathy Screening in Primary Care and Ophthalmologist teleconsultation

Esther Díaz Salcedo, Mònica Torremorell Núñez, Gemma Puig Ponsico, Maria Jesus García Jordán, Cristina Gallardo Sánchez, Encarna Rodríguez Sánchez, Oriol Huguet Briva, Cristina Viladot Viñas, Xavier Castro Bresco, Rosa Codina Pascual, Marta Albiol Serra
Institut Català de la Salut, Barcelona, Spain

Background and aim

The new technologies development can allow us to streamline the process of ophthalmologist teleconsultation if we detect pathology in diabetic retinopathy screening (DRS) in Primary Care (PC). Therefore, it's reasonable to develop new organizational proposals between healthcare levels to improve system efficiency.

The main objective is to speed up the healthcare process when pathology is detected in DRS, using the teleconsultation. As secondary objective we study the diagnostic concordance between physician and ophthalmologist retinography interpretation, and with the diagnosis doing a direct fundus oculi by the ophthalmologist.

Method

Retrospective descriptive study of 2014

Population: diabetic patients included in the DRS (non-mydratic camera) attended in our PC area and presented pathology suspicion, reason why a teleconsultation is performed.

Variables: Total number performed teleconsultation, retinography realization and ophthalmologist teleconsultation response delay, retinography interpretation diagnostic concordance between physician and ophthalmologist, and with the direct ophtalmoscopy diagnosis, main diagnosis in teleconsultations.

Results: Assigned population: 110153, 4245 diabetic patients, 3650 visits in DRS, 98 teleconsultations (2,7% of the DRS visits). From the 98 teleconsultations, we received 96 ophthalmologist response, and 56 patients needed a classroom visit. Average days delay: between DRS visit and ophthalmologist teleconsultation response, 52 +/- 67'9. Diagnostic concordance: between physician and ophthalmologist retinography interpretation: N: 83, good concordance kappa 0'727 (P<0.001). Between physician retinography interpretation and ophthalmologist classroom visit diagnosis: N: 50, acceptable concordance Kappa 0.444 (P>0.001).

Diagnosis in physician teleconsultation: 46.9% moderate diabetic retinopathy (DR), 14.3% mild DR, 8.2% druses. Diagnosis in ophthalmologist teleconsultation: 38.5% moderate DR, 13.5% other pathologies and doubts, 8.3% druses.

Conclusions: The teleconsultation system between specialized levels allowed to speed up the assitance in suspected pathology diabetic patients of DRS. The ophthalmology service waiting lists have decreased. Phsicians do a good retinography interpretation. Retinography is a good screening tool for the pathology detection.

Prevalence and Treatment Strategy of Essential Hypertension in Type 2 Diabetes Subjects

Estera Muchlyte¹, Zydrune Visockiene¹, Laura Siaulienė³, Ruta Baneviciute Domarkiene¹, Rima Povilioniene¹, Margarita Lasevic¹, Monika Niedvaraitė¹, Dalia Palisaityte¹, Daura Raudonyte¹, Asta Sakaite¹, Roma Puronaite², Vytautas Kasiulevicius¹, Virgilijus Sapoka¹

¹Vilnius University, Faculty of Medicine, Vilnius, Lithuania

²Vilnius University Hospital Santariskiu Klinikos, Vilnius, Lithuania

³Karoliniskiu Outpatient Clinic, Vilnius, Lithuania

BACKGROUND AND AIM: Type 2 diabetes mellitus (T2DM) and essential hypertension (EH) are commonly associated conditions increasing cardiovascular risk. Hypertension prevalence in Lithuanian population is 55%, however the data in diabetic subjects are lacking. The aim of study was to evaluate the prevalence and treatment of EH in T2DM subjects in five outpatient clinics in Vilnius.

METHODS: A retrospective analysis of medical records, collecting data from 2012 and 2013 year was performed in 5 largest Vilnius primary outpatient clinics and included a sample of 1591 randomly selected T2DM patients. Data on basic characteristics, disease duration, diagnosis of EH and treatment were collected. Target blood pressure (BP) was $\leq 130/80$ mmHg.

RESULTS: T2DM patients were $65 \pm 10,9$ years of age, average duration of diabetes was $7,4 \pm 5,9$ years. Hypertension was diagnosed in 91,1% of patients (59,5% women, 40,4 % men). Angiotensin- converting enzyme inhibitors were used in 58,0%, beta- adrenergic blockers - in 50,7%, diuretics – in 41,3%, calcium channel blockers - in 34,1%, angiotensin receptor blockers - in 24,9 %, centrally acting medications - in 22,2%, alpha adrenergic blockers - in 4,0 % of patients. Monotherapy was used in 20,5%, combination with two medications - in 33,4%, three - in 29,7%, four - in 13,2 %, five and more - in 3,2% of subjects. The average systolic BP was $141,5 \pm 17,1$ mmHg, diastolic - $83,5 \pm 9,3$ mmHg. Target BP $\leq 130/80$ mmHg was reached in 8,5% of patients who received one medication and in 5,1% who received combined treatment.

CONCLUSION: Hypertension affects majority of T2DM patients and in most cases requires combination therapy with at least two medications. Angiotensin- converting enzyme inhibitors and angiotensin receptor blockers are used in almost all patient which is in line with treatment guidelines. However, target BP is reached in less than 10% of patients, which shows extremely poor control urging for action.

Keywords: diabetes mellitus, hypertension, ambulatory care

Figure No. 1. Incidence of EH in DM patients.

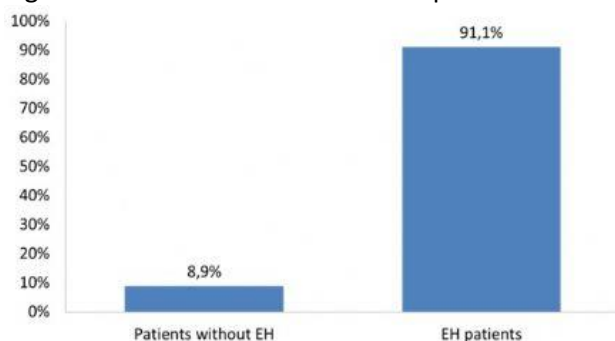

Figure No. 2. The number of medications for EH treatment.

Table No. 1. Used medications.

TOTAL	Number of patients	Percentage
MEDICATIONS		
Angiotensin- converting enzyme inhibitors	841	58,0
Beta- adrenergic blockers	735	50,7
Diuretics	599	41,3
Calcium channel blockers	494	34,1
Angiotensin receptor blockers	361	24,9
Centrally acting medications	372	22,2
Alpha adrenergic blockers	58	4,0

The association between hypertension and affective disorders

Bojan Zoran Pavkovic, Marija Marjan Zaric, Marina Slobodan Brankovic
 Department of General Practice, Health Center "Dr Simo Milosevic"

Background & Aim

Medical evidence based on previous studies suggests existence of comorbidity between mental illness and cardiovascular diseases.

The aim of study was to evaluate association between hypertension and affective disorders, such as depression, bipolar disorder and anxiety.

Method

Data were retrospectively collected from medical records of patients with affective disorders during 12 months follow-up in 2014, and statistical analysis was done to evaluate the correlation with hypertension.

Results

A total of 225 adults, aged 20-50 years, were included in study.

Observed population consisted of 106 patients, of which 57 with anxiety, 49 with depression and 17 with bipolar disorder. Control group consisted of 102 subjects, from general population, all without confirmed mental illness. It was found the following prevalence of hypertension - in observed population it was 77%, of which in anxiety subgroup 84%, in bipolar disorder 64%, and in depression 47%. Prevalence of hypertension in control group was 21%. Analysis showed that there was a statistically significant difference in prevalence of hypertension between observed population and control group (p<0.005). Also, there was a statistically significant difference between

each individual subgroup of observed population and control group ($p < 0.005$).

Interesting is the existence of significantly higher prevalence of hypertension among patients with anxiety than in group with depression.

Prevalence of hypertension was significantly higher in group of bipolar disorder than in the anxiety group, but only at level of safety of 0.90, and not at level of safety of 0.95. There was no statistically significant difference between groups of bipolar disorder and depression ($p > 0.05$).

Conclusions

This study demonstrated an association between hypertension and affective disorders.

Prevalence of hypertension is higher among patients with anxiety disorder compared to those suffering from depression.

It is very important in daily practice to review the blood pressure of patients suffering from affective disorders.

Depression: Therapeutic Approach in Primary Health Care

Maria Joao Nobre¹, Angelo Costa², Joana Guerra³

¹USF Guadiana, Castro Marim, Portugal

²USF Al-Gharb, Faro, Portugal

³USF Mirante, Olhão, Portugal

Background and AIM:

During our Mental Health internship we had the chance to observe how an assertive therapeutic approach allows a faster recover and avoids worsening of clinical status. Therefore we consider pertinent to do a review about this theme. Our aim was to collect and organize the several recommendations and guidelines about treatment of depression with focus on Primary Health Care.

METHOD: This review work was based on research in Medline with the search engine Pubmed on February/2015 with the following words: “(psychotherapy [MeSH Terms] OR drug treatment) AND (depression [MeSH Terms] AND guideline [MeSH Terms])”. From the articles found, and after reading the abstracts, we select the ones written in English or Portuguese, published between January/2005 and February/2015.

We also research on Portuguese Health General Directorate, European Psychiatric Association and American Psychiatric Association webpages for documents or guidelines related with depression.

These publications were analysed and selected based on its relevance and applicability on clinical practice within the speciality of family medicine.

RESULTS: Psychotherapy can be as effective as pharmacological treatment in minor or moderate depressions.

All antidepressant drugs are effective in depression treatment. The drug selection must take in consideration the safety and tolerability of the drug, the type of depression, the clinical characteristics of the patient (comorbidities), drug interactions, the potential side effects and its cost.

CONCLUSION: There is a wide variety of possible treatments for depression, so the therapeutic choice should be individualized according to the patient and their symptoms.

For optimal clinical response is essential the regular monitoring and therapeutic setting.

Keywords: Depression; Primary care; Therapeutic

Clinical Observations

Clinical Observations	
Fluoxetine	- effective in hypersomnia and hyperphagia - activator - long half-life (2 weeks)
Paroxetine	- in cases of depression and anxiety - usually has discontinuation syndrome
Sertraline	- usefull in elderly patients - escalating dose - can cause panic attacks
Mirtazapine	- fast response - slightly sedative
Venlafaxine	- fast response - safe in high doses
Trazadone	- in case of insomnia
Bupropion	- to avoid sexual disffunction - to smoking cessation at the same time
(Es)Citalopram	- less drug-drug interaction

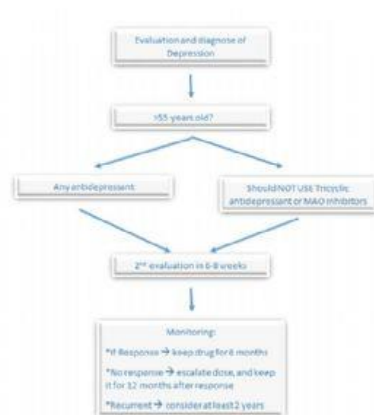

When to referral (Psychiatrist / hospitalization) ?

When to referral (Psychiatrist / hospitalization) ?
- refractory depression (to 2 drugs from diferente classes in high doses)
- Suicidal or homicidal ideas
- Psycotic features
-Catatonia
- Poor judgement
- Grossly impaired functioning

Adverse effects

Common adverse effects	
Diarrhea	Sertraline
Nausea and vomiting	Venlafaxine
Sexual disffunction	Escitalopram fluoxetine, paroxetine, sertraline
Somnolence	Trazadone
Weight gain	Mirtazapina

EARLY DETECTION of DIABETIC RETINOPATHY in OUR HEALTH CENTER

Juan Jesus Rodriguez Vallejo¹, Hector Leonardo Lugo Ramos², Jose Maria Fernandez Gonzalez², Pedro Guijo Gonzalez²

¹Delicias Health Center of Primary Care, Jerez de La Frontera, Cádiz, Spain

²Hospital of Jerez, Jerez de la Frontera, Cádiz, Spain

OBJECTIVES

Assess implementation of the Programme for early detection of diabetic retinopathy (PDPRD) in our health center. Knowing the number of retinographies requested by screening family doctors.

Meet the utility and diagnostic concordance between primary care and specialized ophthalmologists.

MATERIAL AND METHODS

Cross-sectional study of 322 retinographies belonging to patients of 15 quotas and registered in the PDPRD of an urban health center with two districts made during two years. Using the platform of the Integral Plan for Diabetes variables were collected: Age, sex, weight, height, BMI, smoking, nephropathy, years of evolution of diabetes, treatment performed, family doctor requesting the test, diagnosis of the physician performing the first reading, diagnosis of ophthalmologist and final state. Data were processed with SPSSv20.

RESULTS

Of the 322 retinographies studied, there were 50% of each sex. The middle age was 65(+/- 10) years. With an average BMI of 29,66kg/m² and an average duration of the Diabetes of 8 years. Through the doctors who performing the screening were diagnosed a total of 107 possible DR(33.2%) that were sent to the ophthalmologist, 8 patients were diagnosed as known and treated DR(2.5%), 1 was not assessable(0.3%) and 206 retinographies were labeled as normal(64%). After the study by the Ophthalmologist of the 107 possible DR, were finally cataloged as such 27 retinographies(25.2%). With a positive predictive value of 25%. While in 21 test were found other retinal findings(19.6%), 1 was not assessable(0.9%) and the rest were classified as normal(54.2%).

CONCLUSIONS

The use of screening by retinographies was irregular among professionals.

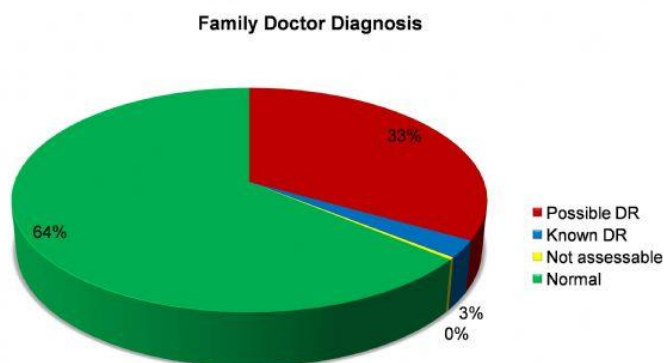

One third of the tests were referred to the ophthalmologist for suspected DR, confirming pathological fourth part of them.

Patients on treatment with insulin have more diabetic retinopathy than the rest.

The agreement rate between the family doctor and the ophthalmologist was low, so a more thorough patient monitoring and periodic training of professionals would be required.

Headache Performance Protocol in Primary Health Care

Maria João Abreu¹, Célia Machado², Helena Ribeiro³, Nuno Namora¹, Teresa Martins³

¹USF Duovida - ACES do Alto Ave, Guimarães, Portugal

²Department of Neurology, Braga, Portugal

³USF Novos Rumos - ACES do Alto Ave, Vizela, Portugal

BACKGROUND: Headache is a very common and one of the symptoms that most often leads patients to complain to a General Practitioner (GP). It can be disabling, affecting men and women of all age groups. According to the World Health Organization, migraine appears among 20 leading causes of loss of healthy years of life per year.

AIM: To review the literature regarding the approach to headache in Primary Health Care.

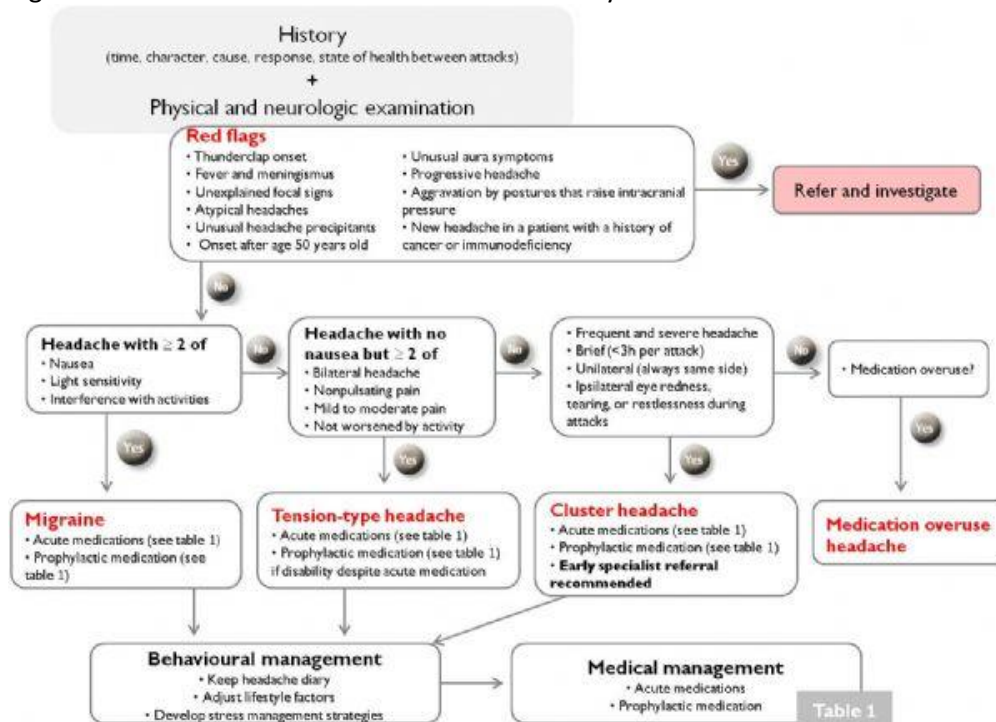

METHODOLOGY: Articles research in Medline/Pubmed, guidelines and specific books in Portuguese or English, using the Mesh terms: "Headache" and "Primary Health Care".

RESULTS: In the evaluation of headache, the clinical history and the physical examination are most important. In Primary Health Care, tension headache, migraine, headache provoked by drug abuse and cluster headache are the most common types, and it is important to recognize that the same individual may experience more than one type of headache. Secondary headaches account for less than 1% of cases, which must be recognized and studied. The additional diagnostic tests, including neuroimaging, are always indicated when the history or physical examination suggest the possibility that it is a secondary headache. Despite headache doesn't have cure, most can be treated effectively. Adequate follow-up of these patients implies the recognition of the treatments (non-pharmacological and pharmacological) available, which represents an important pillar in the control of this problem. Alongside this approach, it is essential that the GP recognizes the criteria for referral to hospital treatment.

CONCLUSION: Headache, beyond its frequency, has a great impact on the quality of life of patients, thus the GP, as the first provider of health care, should be familiar with this approach to be able to monitor symptoms and properly refer the patient to Secondary Health Care, when necessary.

P-0091

Economic impact of costs incurred in monitoring atrial fibrillation. Can we improve efficiency in Primare Care?

Clara Casas, Yuri Ochiai, Isabel Boba, Anna Sanromà, Mercedes Liroz, [Mariam De La Poza](#)
 Centre de Salut Dr. Carles Ribas, Institut Català de la Salut

Background & Aim

Atrial fibrillation (AF) is one of the most prevalent cardiac abnormalities in over 65 years in Spain. Anticoagulant therapy helps prevent the risk of thromboembolic events.

Today we have a new family of oral anticoagulant drugs to which characterizes them less need for monitoring of INR and adjust dose with a favorable safety profile that leads to a reduction of non-pharmacological costs of AF and its complications.

The aims were:

To evaluate the economic cost of INR monitoring of patients with AF treated with acenocoumarol primary care level. Analyze its value compared to other oral anticoagulants in which no monitoring is required.

Methods

We evaluated patients with AF included home care program of an urban health center, during six months (1-9-14/1-3-15)

Cost analysis:

Nonpharmacological direct costs related to monitoring of acenocoumarol (acenocoumarol reflectometer, dipstick), cost of personnel involved and costs of emergency ambulance

Results

N = 29 patients with AF treated with acenocoumarol in home care program.

Costs:

Reflectometer: $2 * 753 = € 1506$

Test Strips: $264 \text{ INR}(1.21) * 264 = € 319.44$

Professionals: Nursing € 1,184, Emergency Medical 1561.2 €, Administrative 712.8 €.

Medical transport for INR > 6 = 4,164.93 (urgent ambulance: € 532.33 and ambulance back: € 62.66)

Acenocoumarol treatment 29 patients: $2.67 € 6m = € 464.58$ / NACO Treatment 6m $90.86 = € 15,809.64$

Nonpharmacological direct cost of entry into hospital: 7 revenues = € 5,901 (Observation + CBC)

Conclusions

The direct cost of monitoring treatment of AF in patients with acenocoumarol household was 17319.95 euros.

This means 1510.31 euros in six months when compared with NACO.

During 6 months, not only save 1510 euros is observed, a liberation center staff could be exchanged for use in enhancing the care of chronic patients.

Chronic heart failure. What not to miss in the treatment of our patients

Juan Manuel García López, Verónica Parent Mathias

Department of Emergencies, Regional Hospital, Málaga, Spain

OBJECTIVE: to influence the use of drugs that have shown an increase in survival of patients with chronic heart failure.

METHOD: Review of clinical practice guidelines of the European Society of Cardiology.

All family doctors have to treat patients with chronic heart failure and we must consider that there are three groups of drugs that should not be missed in the treatment of our patients:

- Angiotensin-converting enzyme inhibitors (ACEIs): If the patient is allergic to these medicines or present adverse effects (cough), is indicated using antagonists of angiotensin II (ARA II).
- Beta-blockers (BB): There is consensus that treatment should be initiated BB in combination with ACE inhibitors / ARBs as soon as heart failure diagnosed with depressed ejection fraction (<40%). They get improved ejection fraction and have anti-ischemic properties. The combination of both treatments achieved dramatically reduce mortality. They are contraindicated in asthma but not in COPD, where we employ selective beta receptor antagonists (bisoprolol, metoprolol, nebivolol). Nor are contraindicated in diabetics.
- Mineralocorticoid receptor antagonists: they have also demonstrated reduced mortality, but should only be used in patients with normal renal function and normal potassium levels. When employed, should monitor renal function and potassium.

It should be noted that diuretics have only shown improvement in terms of congestive symptoms, but not in terms of mortality improvement.

In the table, you can see the dose of the most common drugs of these groups.

Keywords: treatment, chronic, heart failure

dose

Table 14 Evidence-based doses of disease-modifying drugs used in key randomized trials in heart failure (or after myocardial infarction)

	Starting dose (mg)	Target dose (mg)
ACE inhibitor		
Captopril ^b	6.25 t.i.d.	50 t.i.d.
Enalapril	2.5 b.i.d.	10–20 b.i.d.
Lisinopril ^b	2.5–5.0 o.d.	20–35 o.d.
Ramipril	2.5 o.d.	5 b.i.d.
Trandolapril ^b	0.5 o.d.	4 o.d.
Beta-blocker		
Bisoprolol	1.25 o.d.	10 o.d.
Carvedilol	3.125 b.i.d.	25–50 b.i.d.
Metoprolol succinate (CR/XL)	12.5/25 o.d.	200 o.d.
Nebivolol ^b	1.25 o.d.	10 o.d.
ARB		
Candesartan	4 or 8 o.d.	32 o.d.
Valsartan	40 b.i.d.	160 b.i.d.
Losartan ^{b,c}	50 o.d.	150 o.d.
MRA		
Eplerenone	25 o.d.	50 o.d.
Spironolactone	25 o.d.	25–50 o.d.

ACE = angiotensin-converting enzyme; ARB = angiotensin receptor blocker; b.i.d. = bis in die (twice daily); MRA = mineralocorticoid receptor antagonist; o.d. = omni die (once every day); t.i.d. = ter in die (three times daily).

^bIndicates an ACE inhibitor where the dosing target is derived from post-myocardial infarction trials.

^cIndicates drugs where a higher dose has been shown to reduce morbidity–mortality compared with a lower dose of the same drug, but there is no substantive placebo-controlled randomized controlled trial and the optimum dose is uncertain.

^dIndicates a treatment not shown to reduce cardiovascular or all-cause mortality in patients with heart failure or after acute myocardial infarction (or shown to be non-inferior to a treatment that does).

recomendations

Pharmacological treatments indicated in potentially all patients with symptomatic (NYHA functional class II–IV) systolic heart failure

Recommendations	Class ^a	Level ^b	Ref ^c
An ACE inhibitor is recommended, in addition to a beta-blocker, for all patients with an EF ≤40% to reduce the risk of HF hospitalization and the risk of premature death.	I	A	87–91
A beta-blocker is recommended, in addition to an ACE inhibitor (or ARB if ACE inhibitor not tolerated), for all patients with an EF ≤40% to reduce the risk of HF hospitalization and the risk of premature death.	I	A	92–98
An MRA is recommended for all patients with persisting symptoms (NYHA class II–IV) and an EF ≤35%, despite treatment with an ACE inhibitor (or an ARB if an ACE inhibitor is not tolerated) and a beta-blocker, to reduce the risk of HF hospitalization and the risk of premature death.	I	A	99, 100

ACE = angiotensin-converting enzyme; ARB = angiotensin receptor blocker; EF = ejection fraction; HF = heart failure; MRA = mineralocorticoid receptor antagonist; NYHA = New York Heart Association.

^aClass of recommendation.

Hirschsprung's disease – Warning signs

Raquel Cardoso Abreu¹, Andreia Filipa Lopes Fernandes², Catarina Ferreira Leite³, Joana Silva Parente⁴

¹Family Health Care Unit Pro Saúde, Vila Verde

²Family Health Care Unit Alcaides Faria, Barcelos, Portugal

³Family Health Care Unit AmareSaude, Amares, Portugal

⁴Family Health Care Unit São Lourenço, Braga, Portugal

Background&AIM: Alert to the signs and symptoms of the Hirschsprung disease. Describe the clinical characteristics of a newborn with congenital aganglionosis total diagnosed.

Hirschsprung's (DH) disease or aganglionosis is characterized by an absence of ganglion cells and intestinal segment ganglia, being named Meissner submucosal plexus and myenteric Auerbach, respectively.

Newborn (NB), female, with a gestational age of 33 weeks and 5 days. With 18 days, resorts to his family doctor (FD), by presenting a erythema in the region peri anal in extension, being diagnosed by diaper rash.

After six days he comes back due to intense crying. His Mother Refers that the NB has had less faeces after feedings, despite having good breastfeeding.

The objective examination shows abdomen very distended and bloat to percussion.

The mother says that the NB has eliminated meconio only on the 3rd day of his life.

Faced to a patient suspected to have Hirschsprung's disease, evidenced from anamnesis and physical examination, begins the diagnostic investigation. The plain abdominal radiography may reveal gaseous distension of colon handles and the level of obstruction can be inferred by the presence of air in the colon or rectum non-dilated. The definitive diagnosis of Hirschsprung's disease should be established by histopathological examination, allows the view the ganglion cells of the enteric nervous system in tissue samples obtained by rectal biopsies.

METHOD: Case Report–Study of signs and symptoms of DH

RESULTS: Symptoms can start immediately after birth, with a delayed elimination of meconium. Other times, the history of the disease is a chronic constipation. The difficulty in eliminating feces will involve a intestinal dilatation and abdominal distension. This situation can be complicated by the proliferation of bacteria and consequent infection of variable severity.

CONCLUSIONS: The diagnosis should be suspected in any newborn with delayed intestinal transit or in children with history of chronic constipation since the neonatal period.

Keywords: Hirschsprung's disease, aganglionose

Hirschsprung's disease

Breaking the Barriers: Addressing the Patient's Understanding about Insulin in Type 2 Diabetes in Primary Care Clinic

Abdul Hafiz Mohamad Gani

Department of Health, Federal Territory of Labuan, Labuan, Malaysia

BACKGROUND: Resistant in accepting insulin as a part of diabetes treatment is a common scenario facing by most of primary care physician. Patients have their own perception in addition to the information that they received which may contribute to their compliance of treatment plan.

AIM: To identify patient myths and clinical facts that may affect their decision on insulin as one of the treatment option in Type 2 Diabetes

METHOD: 384 registered Type 2 Diabetes patients in Primary Care Clinic in Labuan, Malaysia were randomly selected. Patients who are on insulin were excluded from the study. The questionnaires consisted of socio-demographic and lists of ten questions on the most important barriers were given to them. They were also given option whether to accept insulin treatment if advice by doctor in the future.

RESULTS: Based on the interviewed data, 71.3% (n: 274) of them knew or have heard of insulin. Only 11.1% of them disagreed that insulin is given only to diabetic patient with uncontrolled blood glucose level only. However, majority of the patients agreed that insulin should be kept in a special place. Those with high score (correctly answered the questionnaires) have better acceptance toward insulin for diabetic management.

CONCLUSIONS: It is important to address the patient's understanding about insulin in Type 2 Diabetes before the decision to initiate insulin in order to rectify any misconception. Those with proper understanding regarding insulin have better acceptance towards insulin use in diabetic treatment.

Recurrent epistaxis, more than a nasal mucose alterations

Miriam Rey Seoane¹, Rabee Kazan³, Cristina Herranz Martinez¹, Ana Rascón García⁴, Julio Verastegui Cordova⁴, Franco Paniccia Cuocco²

¹Hospital de Viladecans, Barcelona, Spain

²Hospital Los Camilos, Barcelona, Spain

³Hospital La Mutua de Terrasa, Spain

⁴CAP El Castell Castelldefels, Spain

Spontaneous recurrent epistaxis is usually the earliest sign of Hereditary Hemorrhagic Telangiectasia (HHT) but in this case a casual finding in a x-ray did the diagnosis.

We present a 46 years-old female who consulted her doctor about continuous and recurrent epistaxis since the age of 24. She had clinical history of hypothyroidism, herpes zoster, discal hernia, 3 miscarriages, chronic depression. Medication. Eutirox. She referred chronic recurrent epistaxis and some tongue telangiectasia in years prior to consultation. Physical examination is normal, otorrinolagingology examination only reflects a alteration in the nasal mucosa. As a complimentary test a chest x-ray was demanded, and was commented as a alteration in the upper-right pulmonary lobe and a radiologist recommended a CT-scan. In the CT-SCAN a nidus, an arteriovenose malformation around 3,1 cm in the upper-right. pulmonary lobe was been detected and in concur with all the others clinical simtons a diagnosis was made. Differential diagnosis in recurrent epistaxis is basic in primary care but illness such as HHT are usually not in the equation, things like hypertension, nasal mucosa alteration (allergic rhinitis, arterial malformation) or blood coagulation alterations. Casual findings in other complementary test could be our best resource to solve an years problem.

Proposal of a Primary Care follow-up protocol for management of patients with chronic Heart Failure

Joana Ribeiro¹, Luís Santos², Tiago Adrega², Patrícia Morgado¹, Sofia Madanelo³, José Santos²

¹Unidade de Cuidados de Saúde Primários Aveiro I, ACES Baixo Vouga

²Department of Cardiology, Centro Hospitalar do Baixo Vouga, Aveiro

³Unidade de Saúde Familiar Santa Joana, ACES Baixo Vouga

BACKGROUND: Due to ageing population and burden of ischemic heart disease, Family Physicians (FP) are increasingly entailed to face the challenging patients with chronic Heart Failure (HF).

Although the bulk of these patients have hospital follow-up, they frequently resort to the FP, mainly due to aggravated symptoms, other comorbidities and prescription renewal.

It is therefore essential that the FP is informed about the condition and accordingly prepared for appropriate clinical management. For these reasons, we propose a clinical protocol to improve clinical practice excellence in this setting, and adapted to the Primary Care reality.

AIM: I. Individualization of care in patients with HF (NYHA class \leq II) with up-to-date evidence; II. Improve patient's quality of life; III. Prevent hospital admissions; IV. Hamper HF progression; V. Decrease the disease's economic burden; VI. Foster collaboration between Primary and Secondary Care.

METHODS: We evaluated the international guidelines with more scientific impact and performed additional literature search on HF. The information was organized and adapted in consonance with Primary Care challenges. The project was carried out with the help of Cardiology and FP experts. Finally, it has been proposed for presentation to FP of the hospital referral area.

RESULTS: an integrator document was conceived, directed to FP, proposing decision-making flow charts designed to guide the clinical judgment, and consists of eight main points: I. Patient and caregiver information and education; II. Provide social support; III. Lifestyle modification and control of risk factors; IV. Clinical monitoring (symptoms, physical examination, drug's iatrogenesis, concomitant diseases); V. Analytical, electro and echocardiographic management; VI. Pharmacological management; VII. Control of comorbidities (namely vaccination); VIII. Red flags for hospital referral.

CONCLUSION: The existence of protocols adapted to the reality of Primary Care underpin a valuable resource to optimize medical performance and ensure excellence of care for patients with chronic HF.

Keywords: Chronic Heart Failure; Primary Care; protocol; clinical management; follow-up; guidelines.

Summary of the guidelines described in the protocol for follow-up of patients with heart failure by the family doctor

I. Patient and caregiver information and education	<p>Provide information about the disease, the causes and treatment Reinforce the importance of adherence to therapy; Understand the indications, doses and effects of drugs; Teaching self-management of symptoms and warning signs</p>
II. Provide social support	<p>Family support assessment Assess the need for psychosocial support</p>
III. Lifestyle modification and control of risk factors	<p>Provide information about risk factors: - alcohol [Discouraging alcohol; consumption <2U / alcohol / day in men and <1 U / day in women] - tobacco [Stop; provide medical assistance required] - physical exercise [Regular physical activity of low intensity; 30 minutes per day during 5 weekdays] - dietary changes [Consumption <2-3g / sodium daily; water restriction <2L / day; warn of risk of malnutrition in advanced stages; consider evaluation by nutritionist] - Therapeutic alternatives [Warn of the risk of these therapies may interfere with heart function]</p>
IV. Clinical monitoring	<p>Physical examination Symptoms / signs - Related to heart failure - Related to causes of decompensation or therapy (drug's iatrogenesis) - Related to concomitant diseases</p>
V. Analytical, electro and echocardiographic management	<p>Analysis: Renal function and ionogram [regularly because side effects of HF therapeutic] Hepatic Function Hemogram [if signs or symptoms of anemia] Inflammatory markers [if signs or symptoms of infection] Thyroid function [if pathology suspected_ pro-arrhythmic risk]</p>
	<p>Ecocardiograma If signs or symptoms new or worsened [no routine indication]</p>
	<p>Electrocardiogram If arrhythmia suspected If signs or symptoms new or worsened [no routine indication]</p>
VI. Pharmacological management	<p>Dose adjustment of therapeutic drug Depending of clinical evolution, side effects and comorbidities</p> <ul style="list-style-type: none"> - ACE inhibitor: all patients with EF ≤ 40% - B-blockers: in addition to an ACE inhibitor in all patients LVEF ≤40% with a - MRA: persistent symptoms (NYHA classII-IV) and LVEF ≤ 35% despite treatment with an ACE inhibitor and a beta blocker. - Ivabradine: persistent symptoms (NYHA classII-IV) and EF ≤ 35% despite treatment with an ACE inhibitor, beta blocker and MRA. - Diuretics: control congestive symptoms.
VII. Control of comorbidities	<p>Vaccination (influenza virus; anti-pneumococcal vaccine) Early and timely response to patients with inflammatory / infectious symptoms</p> <p>Early diagnosis of factors that can be prevented and that can cause</p>

decompensation:

- Diabetes mellitus [avoid hypoglycemia; avoid glitazones; keep controlled HbA1C]
- Dyslipidemia
- Blood pressure
- Anemia
- Depression [leads to worse prognosis tricyclic antidepressants should be avoided]
- Obesity
- Sexual dysfunction
- Drop [avoid nonsteroidal anti-inflammatory drug; use colchicine]
- Sleep apnea syndrome [independent factor of poor prognosis; identify and treat]
- Travels [Traveling always accompanied by a report with medical history, the updated therapeutic and supplementary medication]

Acute clinical decompensation (referral to ER);

Worsening of symptoms despite optimal therapy

Worsening of ventricular function by echocardiography

Other concomitant pathology that requires evaluation by a cardiologist

Family doctor's difficulty in managing therapy/ symptoms

VIII. Red flags
for hospital referral

The table summarizes the main guidelines to be considered in the follow-up of patients with heart failure, which are described in the protocol proposal [Note: Most patients with heart failure are followed in the cardiologist, the Indications for referral is intended for patients who require early consultation by cardiologist or observation in the ER] [HbA1c: hemoglobin A1c; HF: Heart Failure; ACE inhibitor: angiotensin-converting-enzyme inhibitor; LVEF: Left Ventricular Ejection Fraction; MRA: Mineralocorticoid Receptor Antagonist; NYHA: New York Heart Association (NYHA) Functional Classification; ER: Emergency Room]

Proposal of a Primary Care follow-up protocol for management of patients with Valvular Heart Disease

Joana Ribeiro¹, Luis Santos², Tiago Adrega², Bruno Oliveira¹, Patrícia Morgado¹, José Santos²

¹Unidade de Cuidados de Saude Primarios Aveiro I, ACES Baixo Vouga

²Department of Cardiology, Centro Hospitalar do Baixo Vouga, Aveiro

BACKGROUND: Valvular Heart Disease (VHD) is a burgeoning condition in patients accompanied by Family Physicians (FP) that demands close monitoring since it often requires intervention.

The observation of patients diagnosed with VHD is often performed in parallel between Primary and Secondary Health Care, especially in patients with compensated, non-critical VHD.

It is therefore essential that the FP is informed about the condition and accordingly prepared for appropriate clinical management of these patients. For these reasons, we propose a clinical protocol to improve clinical practice excellence in this setting, and adapted to the Primary Care reality.

AIM: I. Standardization of care in mild to moderate cases and those stabilized after intervention, with up-to-date evidence; II. Increase disease morbidity and mortality; III. Foster collaboration between Primary and Secondary Care.

METHODS: We evaluated the international guidelines with more scientific impact and performed additional literature search on VHD. The information was organized and adapted in consonance with Primary Care challenges. The project was carried out with the help of Cardiology and FP experts. Finally, it has been proposed for presentation to FP of the hospital referral area.

RESULTS: an integrator document was conceived, directed to FP, proposing decision-making flow charts designed to guide the clinical judgment, and consists of seven main points: I. Patient information and education; II. Clinical monitoring (symptoms, physical examination, drug's iatrogenesis, concomitant diseases); III. Control of risk factors related to disease progression and endocarditis; IV. Control of comorbidities; V. Pharmacological management (namely anticoagulation in mechanical valves); VI. echocardiographic follow-up; VII. Red flags for

hospital referral.

CONCLUSION: The existence of protocols adapted to the reality of Primary Care underpin a valuable resource to optimize medical performance and ensure excellence of care for patients with VHD.

Keywords: Valvular Heart Disease; Primary Care; protocol; clinical management; follow-up; guidelines.

Follow-up of asymptomatic patients with mild-moderate valvular disease after evaluation by cardiology

	Symptoms / Physical Examination	Complementary means of diagnosis	Referencing
Aortic stenosis (AS) (A regular follow-up should be determined by the initial clinical evaluation and at each visit)	- Fatigue - Dyspnea - Dizziness - Syncope - Angina Auscultation: systolic ejection murmur (compare with previous evaluation)	Echocardiogram: Mild AS: 1-2 Years Moderate AS: 6 Months -1 Year	Presence of symptoms If asymptomatic but severe AS [Mean gradient > 40 mmHg Area <1cm ²]
Mitral Regurgitation (MR) (Primary) [Degenerative factors; rheumatic fever]	- Dyspnea - Fatigue Systolic murmur (not related to the severity) 3rd heart sound (compare with previous evaluation)	Echocardiogram: Mild MR (asymptomatic): 2-3 Years Moderate MR: Annual	Presence of symptoms AF; doubts regarding to anticoagulation
Aortic Regurgitation (AR)	- Decreased diastolic pressure - Increased arterial pulses - Dizziness Protodiastolic blow (compare with previous evaluation)	Electrocardiogram / Holter: annual Echocardiogram: Mild AR: 2-3 Years Moderate AR: Annual	Severe MR Presence of symptoms Severe AR
Mitral Stenosis (MS)	- Palpitations - Dyspnea - Fatigue Systolic murmur; Opening snap (hard to listen) (compare with previous evaluation)	Mild MS: 2-3 years; Moderate MS: 1-2 years; Holter: Annual	Presence of symptoms Severe MS

This table summarizes the main indications proposals for follow-up by family physicians of patients with valvular disease non-surgically intervened

Proposal for follow-up, by family doctor, of asymptomatic patients with history of surgical intervention to valvular disease

Biological prostheses / valvuloplasty

Prosthetic Valves

Clinical evaluation	Auscultation of the prosthetic sound [compare with previous evaluation]	Auscultation of the prosthetic sound [compare with previous evaluation] Continuous anticoagulation With Vitamin K Antagonists (VKA) (Are contraindicated new oral anticoagulants) [INR -> 2-3 If mitral or tricuspid prosthesis -> 2.5-3.5]
Anticoagulation	No need continuous anticoagulation	[Allow for patients with high thromboembolic risk: Atrial Fibrillation; mitral or tricuspid valve prosthesis; Thromboembolism history; LVEF <35%; mitral stenosis] Interruption: minor surgical procedures: consider not stop Major surgical procedures: Keep INR <1.5; stop VKA; do LMWH in therapeutic dose bid;
Endocarditis risk	Dental assessment and regular dental hygiene; Prophylaxis for dental risk procedures: (30-60 minutes prior to the procedure) - Amoxicillin 2 g po ev - Clindamycin 600mg po ev (if allergy to beta-lactam) In case of infection (respiratory, gastro-intestinal, genitourinary or dermatological, include the antibiotic treatment agent against Staphylococcus).	Dental assessment and regular dental hygiene; Prophylaxis for dental risk procedures: (30-60 minutes prior to the procedure) - Amoxicillin 2 g po ev - Clindamycin 600mg po ev (if allergy to beta-lactam) In case of infection (respiratory, gastro-intestinal, genitourinary or dermatological, include the antibiotic treatment agent against Staphylococcus).
Hemolysis risk	Without increased risk	- Complete blood count; - Haptoglobin; - LDH; Treatment: iron supplements; beta-blockadores; erythropoietin.
Echocardiogram	Yearly If further changes to auscultation (worsening of murmur, absence of the prosthetic sound	Yearly If further changes to auscultation (worsening of murmur, absence of the prosthetic sound
Referencing	- New symptoms; - Changes in cardiac auscultation (worsening of murmur); - Suspected endocarditis; - Difficulty in the management of antibiotic prophylaxis at risk procedures; - Echocardiographic signs of prosthetic dysfunction.	- New symptoms; - Changes in cardiac auscultation: worsening of murmur, absence of hearing the prosthetic sound - Difficulty in managing anticoagulation; - Suspected endocarditis; - Suspected hemolysis; - Difficulty in the management of antibiotic prophylaxis at risk procedures; - Echocardiographic signs of prosthetic dysfunction.

The proposal takes into account the main care that should be part of the evaluation of these patients: clinical, the main risk factors (thromboembolic, endocarditis, hemolysis), imaging tests and the criteria for referral depending on the type of intervention (biological or mechanical prosthesis) [LVEF: Left Ventricular Ejection Fraction; INR:

P-0098

Comorbidity in patients included in the program of Planned Home Care in the province of Lecce

Ernesto Mola¹, Silvia Aprile², Maria Alessandra Carrozzo²

¹Interdisciplinary Scientific Association of both Family and Community Medicine - ASSIMEFAC

²Vocational training in General Practice - Medical College of Lecce Province

Background

Comorbidity has been defined as the presence of two or more diseases in the same individual. It is a common condition in elderly people and a challenge mainly for general practitioners (GPs), because it implies a contemporary management of diseases of different organs and apparatus. In Italy about 5% of elderly patients are included in the program of Planned Home Care (PHC) by GPs, with a different care burden in relation with comorbidity.

Aims

- to know the predominant diseases among patients included in the program of PHC in the health district of Lecce and calculate Charlson and Barthel indexes.
- To measure the care burden in relation with comorbidity.
- To know which diseases are treated with drugs and the number of drugs daily taken.
- To know the perception of the comorbidity by patients and FDs.

Design

The trainees of the vocational training in General Practice of the Medical College of Lecce recruited the patients included in the PHC of the trainer GP. Then, for each patient they completed a form of five sections. The first three sections concerned the data of patient, the section D was a questionnaire to the FD, and the section E a questionnaire to the patient.

Results

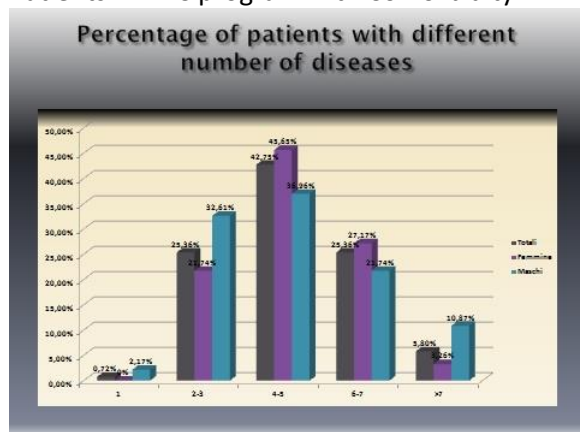

138 patients have been recruited, 92 women and 46 men. 67,9% need a help for gait and 41,30% are cared by a salaried caregiver. The predominant diseases are heart failure (42,03%) and cerebro-vascular disease (49,28%). While patients perceive rheumatic diseases (37.30%) as the most important illnesses, only 40% receive a treatment for them and only 3 out of 138 rehabilitative care.

Conclusions

Comorbidity in elderly patients is a big challenge for primary care. Health services should pay specific attention to needs and expectation of patients, and should tailor care on individual conditions.

Chronic wounds and seasons. Is there a relationship?

Anna Lanau Roig, Ángel Casado Bech, Teresa Graell Riera, Julian Martín Martín, Laia Martí Clavé, Andrea Moncau Mayola

Health centre La Marina, Institut Català de la Salut, Barcelona, Spain

BACKGROUND:

Chronic wounds have different etiologies: pressure ulcers, varicose ulcers, arterial ulcers, neuropathic ulcers and other wounds healing by second intention. All they have one thing in common, the difficult healing.

Chronic wounds represent a significant consumption of resources, material and human.

AIM:

Knowing the correlation between the incidence of chronic wounds and:

- The season
- The temperature.

METHOD:

Cross-sectional retrospective study of January 1 to December 31, 2013, with a population of 15,389 persons, aged more than 15 years, attended in a primary health care of Barcelona.

Variables were collect, through medical story, which included gender, age, wound type and date of appearance.

The monthly mean temperature values were provided by the official meteorological service.

For statistical analysis wounds were grouped according to their etiology, the season and the mean temperature.

We worked with confidence intervals of 95%.

RESULTS:

Were located 48 chronic wounds. The mean age was 72.04 years with a standard deviation (SD) of 5.78, 52.1% were women and 47.9% men.

62.5% were leg ulcers (LU), 22.9% other chronic wounds healing by second intention and 14.6% pressure ulcers (PP).

The data showed a higher incidence of LU and PP (76.7% and 71.4% respectively) in the warm seasons (spring-summer), although no statistically significant difference ($p = 0.159$) for the cold seasons (autumn-winter).

No statistically significant differences were observed ($p = 0.544$) when comparing the average temperature at the moment of appearance the wounds.

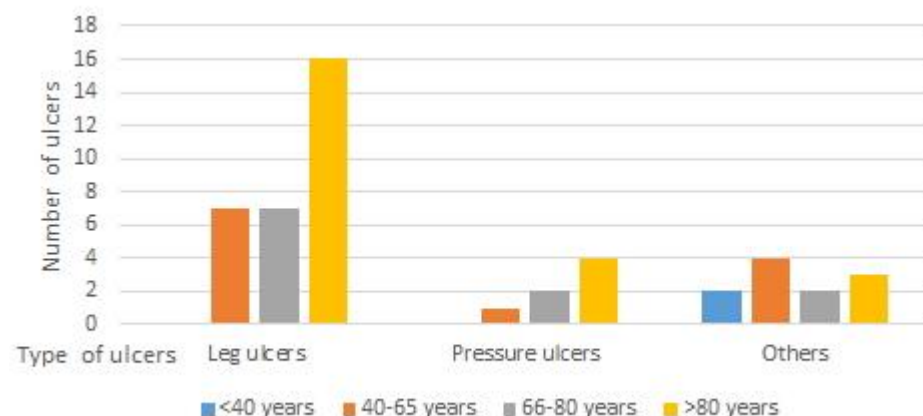

CONCLUSIONS:

A trend is observed at a higher incidence of LU and UPP in the warm seasons. A larger sample could be statistically significant. There is no relationship between the season and the appearance of other chronic wounds healing by second intention.

There is no relationship between temperature and the appearance of chronic wounds.

Keywords: skin ulcer, season, temperature, nursing care, primary health care,

Figure 1. Skin ulcers depending on age

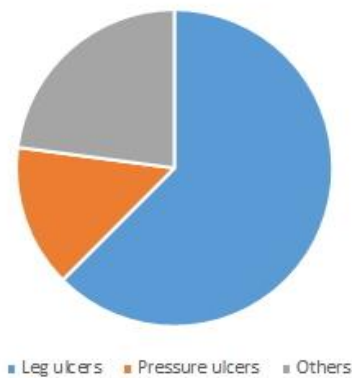

LU and PU are more common in people over 80 years

Figure 2. Skin ulcers depending on the sex

No statistically significant differences between men and women

Figure 3. Type of chronic wounds

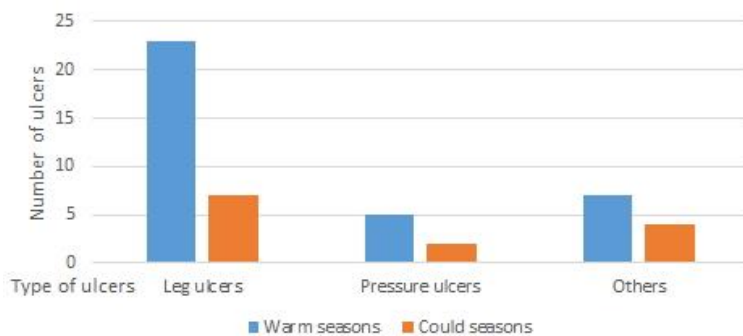

The most common chronic wounds are chronic leg ulcers

Figure 4. Average monthly temperature 2013

From April to September have been considered warm seasons From Octure to May have been considered cold seasons

Figure 5. Incidence of skin ulcers depending on season of year

In the warmer seasons there is more incidence

Case-mix adjusted differences in the treatment of cardiovascular risk factors in patients with type 2 diabetes in Sweden

Mikael Lilja¹, Bettina Julin², Gudrun Andersson³, Inga Lena Andersson⁴, Mette Axelsson⁴, Robert Kristiansson⁵, Janeth Leksell³, Agneta Lindberg⁶, Peter Lindgren², Fredrik Löndahl⁷, Karin Loström Muth⁸, Ann Marie Svensson⁹, Tobias Dahlström¹⁰

²Ivbar, Stockholm, Sweden

³The Swedish Society of Diabetes nursing

⁴The Swedish association of clinical dietitians

⁵The county council of Uppsala, Uppsala, Sweden

⁶The county council of Skåne, Malmö Sweden

⁷The association of Swedish diabetes patients

⁸The region of Västra Götaland, Vänersborg, Sweden

⁹Swedish National Diabetes Register, Göteborg, Sweden

¹⁰The county council of Dalarna, Falun, Sweden

BACKGROUND AND AIM

Proper management of cardiovascular risk factors constitutes a cornerstone in the management of type 2 diabetes. Prescription patterns vary across Sweden. However, to what extent this variation remains if account is taken to differences in patient populations has not been studied. As part of the ongoing National Collaboration for Value Based Reimbursement and Monitoring Systems, we set out to investigate this by conducting a case-mix adjusted comparison of the participating county councils.

METHODS

Persons with a health care contact and a diagnosis of diabetes during 2010-11 in the administrative systems of seven Swedish county councils (Dalarna, Jämtland Härjedalen, Skåne, Stockholm, Uppsala, Västra Götaland and Östergötland), covering ~70% of the Swedish population was linked to data from the National Diabetes Register, socioeconomic data from Statistics Sweden and data on filled prescriptions from the Prescribed Drug Register. We estimated random effects models on the number of antihypertensive classes the patients received during one year following inclusion and whether or not the patient received a statin, adjusted for age, gender, level of education, civil status, duration of diabetes, the presence of diabetic complications, systolic blood pressure, LDL-cholesterol, BMI, and smoking status.

RESULTS

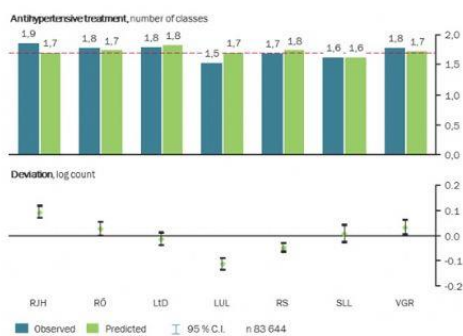

Based on a complete case approach, 83 644 patients were analyzed. Antihypertensive treatment was more intensive in Jämtland Härjedalen, Östergötland and Västra Götaland while Uppsala and Skåne prescribed significantly fewer classes per patient. Statins were more frequently prescribed in Jämtland Härjedalen, Östergötland, and Skåne, less frequently so in Uppsala and Stockholm. County councils with less intensive therapy had fewer patients at treatment goal.

CONCLUSIONS

There were significant differences in the prescription patterns of antihypertensive drugs and statins between the county councils. These differences remained when taking a wide range of clinical and socioeconomic factors into account. These data indicate that unequal treatment is not uncommon in Sweden.

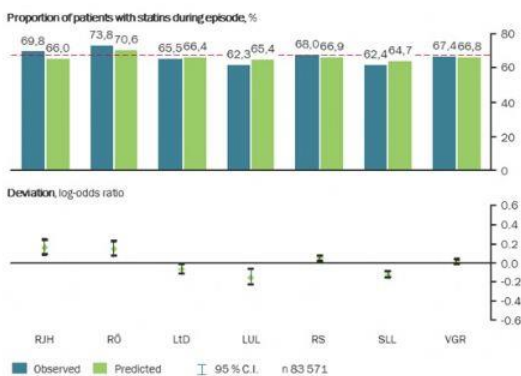

Keywords: Value based monitoring, diabetes type 2, risk factor treatment

Antihypertensive treatment, number of classes

Adjusted for: age, gender, level of education, civil status, born outside of EU, duration of diabetes, the presence of diabetic complications, systolic blood pressure, LDL-cholesterol, BMI, comorbidities, eGFR and HbA1C at start of episode, and smoking status

Statin use, proportion of patients (%)

Adjusted for: age, gender, level of education, civil status, born outside of EU, duration of diabetes, the presence of diabetic complications, systolic blood pressure, LDL-cholesterol, BMI, comorbidities, eGFR and HbA1C at start of episode, and smoking status

Asthenia and swollen legs

Paola Lievano, Patricia Lloro, David Idoipe, Yamileth Guerrero, Mercedes Cervero, Sara Sastre, Carlota Canet, Sara Lainez, Jose Antonio Ibañez, Oscar Zepeda, Miguel Lopez Del Pueyo, Jesus Tenias, Laura Urieta, Amparo Cantin, Laura Bosqued, Miguel Rivas

Department of Community & Family Medicine. Sector III. Hospital Clínico Universitario Lozano Blesa, Zaragoza, Spain.

Background & Aim

Glomerular disease is a common problem in patients consulting primary care. Urinalysis, estimated glomerular filtration rate (GFR) and patient age help to detect the most likely causes. Family history and comorbidities also may suggest particular etiologies. However, confirmation by renal biopsy is generally required.

Method

64 year-old woman with a history of psoriasis, hypertension and asthma.

Asthenia, generalized aches and edema in both legs since months. On examination shows slight ankle edema without other findings.

Results

Initial blood test shows hypercholesterolemia, hypertriglyceridemia and LDH increase, hypoproteinemia.

Proteinuria and urine albumin/creatinine ratio increased. It was recommended reducing sodium intake, diuretic therapy is added and it is sent for assessment and treatment of nephrology. Serology is prompted; EAB, iron metabolism, HbA1c, and autoimmune Ig and complement AC within normal parameters except for a decreased IgG and increased C3. Bence Jones protein urine culture and negative ion with impaired clearance. Negative fecal occult blood. Abdominal ECO with bilateral pleural effusion, normal kidneys.

Corticosteroid treatment is initiated, with poor response (deterioration of renal function, so far with urea and creatinine in normal serum, and reduced general condition), so finally renal biopsy was performed.

CONCLUSION: Among the leading causes of nephrotic syndrome are the primary glomerulopathies but we must not forget the existence of general diseases affecting the glomerulus and which have considerable prevalence in adults (up to 40% versus 60%) as the case we reviewed, that revealed presence of amyloidosis.

Keywords: Nephrotic syndrome. Glomerular disease. Amyloidosis.

Evaluation of Thalassemia Trait from Ondokuz Mayıs University, Department of Family Medicine

Aysenur Alper Gurz, Bahadır Yazicioglu, Fusun Artiran Igde

Department of Family Medicine, Ondokuz Mayıs University, Samsun, Turkey

Background & AIM: Thalassemia is a form of blood disorder characterized by hypochromic microcytic anemia, caused abnormal formation of haemoglobin. A higher frequency of thalassemia trait (TT) cases is reported mostly from the Mediterranean region, including Turkey. In this study we aimed to evaluating patients laboratory results that consulted to department of family medicine for TT. And we aimed to attend the important points for traiting.

Material&METHODS: In this study, we analyzed patients' laboratory results that consulted to department of family medicine for distinguishing trait the family whom daughter/son is thalassemia. This study investigated between April 2011-June 2014, in Ondokuz Mayıs University, Department of Family Medicine. Evaluation of the samples; MCV<80 fL=low, Mentzer index (MCV/RBC)<13= high risk for TT. HbA2>3.5% and/or HbF>2.0%= TT.

RESULTS: Between April 2011 and July 2014, 99 patients (49.5 % female (n=49) and 50.5% male (n=50)) have been examined for thalassemia. The mean of age is 34.5±7.3. 53.53% of the patients (n=53) have been diagnosed with TT. It is observed that 3.03% of mothers (n=3) have α , 17.17% (n=17) has β -TT and 7.07% of fathers (n=7) have α , 19.19% (n=19) has β -TT. The brother of a patient whose father is β -TT is observed to have β -thalassemia as well. In the examinations applied on parents, it is seen that one couple has α and two couples have β -thalassemia. The relation between the diagnoses and MCV are examined (Table 1).

CONCLUSION: To prevent the increase in the costs, complete blood counts should be performed primarily to parents for the evaluation of thalassemia trait and it should be appropriate distinguish of iron deficiency anemia

and TT and than make further examinations. Hb electrophoresis is an expensive examination and it will be much more cost-effective policy if is requested from those who believed thalassemia according to CBC results.

Surveillance of Chronic Obstructive Pulmonary Disease in a Primary Health Care Unit

Helena Ribeiro, Teresa Martins, Vânia Leite, Bruno Vaz
USF Novos Rumos, ACES Alto Ave, Vizela, Portugal

BACKGROUND: Chronic Obstructive Pulmonary Disease (COPD) is considered an important public health problem, being the fourth leading cause of death in the World. The estimated prevalence of COPD in Portugal varies between 4% and 14%.

AIM: To determine the prevalence of COPD and characterize its surveillance in the population of a primary care unit.

METHOD: Observational, descriptive, analytical and transversal study in adult patients of a primary care unit with COPD code (R95) of the International Classification of Primary Care - 2nd edition. The variables were collect in February 2015 through the electronic clinical records. Statistical analysis was performed with SPSS.

RESULTS: The prevalence of COPD was 0.92%, with a mean age of $69,7 \pm 11,9$ years and an average BMI of 27.1 kg / m². 62.3% patients were male, 13.7% smokers, 2.7% ex-smokers and 14.4% had no records. The influenza vaccine was administrated in 51.4% patients, and the pneumococcal vaccine in 16,5%. Only 34,9% performed a diagnostic spirometry with bronchodilator test. Considering the latest spirometry, 26.3% was performed in the last four years, 14.4% in more than four years and 59.6% had no record of a spirometry. In 78% patients the forced expiratory volume in one second (VEF1) was not registered. Regarding treatment, 18.5% perform short-acting bronchodilators, 26% long-acting anticholinergic (LAMA) or long-acting beta2-agonists (LABA), 3,4% LAMA and LABA, 34,2% inhaled corticosteroids (ICS) and LAMA or LABA, 4,1% ICS, LAMA and LABA and 13,7% methylxanthines.

CONCLUSION: The prevalence of COPD found is lower than reported in the literature, which may be explained by the absence of diagnose recording. Adequate surveillance of COPD may reduce patient's symptoms, which improves quality of life, prevents the disease's complications and reduces the associated morbidity and mortality. The General Practitioner is in a privileged position to diagnose COPD and ensure its proper surveillance.

Evaluation of dyslipidemia in type 2 diabetes: degree of control and associated lipid-lowering treatment

Carmen Maria Cortes Salazar¹, Jose Carlos Fernández Garcia², Diana Domínguez Jiménez³

¹Primary Care Centre of Badolatosa, Seville, Spain.

²Endocrinology Department, Virgen de la Victoria University Hospital, Málaga, Spain.

³Primary Care Centre of Estepa, Seville, Spain.

Background & AIM: Dyslipidemia is one of the major risk factors for cardiovascular disease in type 2 diabetes mellitus (T2DM). The characteristic features of diabetic dyslipidemia are a high plasma triglyceride concentration, low HDL cholesterol concentration and increased concentration of small dense LDL-cholesterol particles. In this study we aimed to evaluate the degree of control of dyslipidemia in patients with T2DM in primary care.

METHOD: Retrospective cohort study which included patients with T2DM followed in a primary care setting. Patients were classified according to the following criteria: strict control of dyslipidemia (LDL<100 mg/dl and triglycerides < 150 mg/dl), partial control of dyslipidemia (LDL≥100 mg/dl or triglycerides ≥150 mg/dl), or absence of control of dyslipidemia (LDL≥100 mg/dl and triglycerides ≥150 mg/dl). Treatment with lipid-lowering drugs (statins, fibrates, nicotinic acid, ezetimibe) was also collected.

RESULTS: 183 patients were included, with a mean age of 62.1±8.3 years (58.4% women). After stratification of patients according to previous criteria, only 32% of patients had strict control of dyslipidemia, 43% had partial control of dyslipidemia and 25% had absence of control of dyslipidemia. Associated lipid-lowering treatment was present in 72% of patients with strict control, in 81% of patients with partial control and in 90% of patients with absence of control.

CONCLUSIONS: Despite the high rate of prescription of lipid-lowering therapy in patients with T2DM, a significant percentage of patients do not achieve recommended lipid goals.

Keywords: type 2 diabetes, dyslipidemia, associated-treatment

Determinants of the risk for dying or hospitalization in heart failure patients included in homecare programs

Miguel Angel Muñoz, Jose Maria Verdú Rotellar, Jose Luis Del Val, Xavier Mundet, Ernest Vinyoles, Mar Domingo, Eva Frigola, Cilia Mejia Lancheros
Institut Català de la Salut. Primary healthcare University Research Institut IDIAP-Jordi Gol.

Background & AIM: Primary care programs oriented to provide homecare to the most fragile patients has been carried out for several years. Nevertheless, not specific analysis has been made to know the characteristics and prognosis of heart failure patients included in these programs. Our study is aimed at knowing the differences in the characteristics, mortality and hospitalization rates between heart failure patients needing medical homecare and community dwelling ones.

RESULTS: 8.376 patients with heart failure were followed since 2009 to 2012 (median of follow up: 11,6 months, P25-75, 5.9-23.6), in Catalunya (Spain). Mean age was 78.0 years (SD 10.2) and 55.9% were women. Patients included in homecare programs represented 26.8% of the total, and had more frequently cardiovascular comorbidity (hypertension, diabetes, atrial fibrillation, history of stroke, peripheral artery disease) and previous hospitalization as a consequence of HF than those community dwelling. These patients were significantly older and had a worse cognitive profile.

Probability of dying during the follow-up was higher in patients included in homecare programs: OR 1.32 (95% Confidence Interval, 1.05-1.67) but the significance disappeared when adjusting for cognitive impairment (OR 1.15, 95% Confidence Interval 0.84-1.58). Probability of being admitted at hospital for a cardiovascular episode was also higher for homecare patients, but the OR was reduced from 2.32 (95% Confidence Interval 2.07-2.60) to 1.34 (95% Confidence Interval, 1.00-1.79) when cognitive impairment was introduced in the multivariate models.

CONCLUSIONS: HF patients included in homecare programs had higher cardiovascular comorbidity. Cognitive impairment determines the higher risk of dying or being admitted at hospital as a consequence of a cardiovascular event in this population.

Keywords: Primary care, homecare, Heart Failure, prognosis

Efficacy of liraglutide in type 2 diabetes: analysis of 23 patients attended in primary care

Carmen Maria Cortes Salazar¹, Jose Carlos Fernández Garcia², Diana Domínguez Jiménez³

¹Primary Care Centre of Badolatosa, Seville, Spain.

²Endocrinology Department, Virgen de la Victoria University Hospital, Málaga, Spain.

³Primary Care Centre of Estepa, Seville, Spain.

BACKGROUND & AIM: To evaluate the efficacy of liraglutide (a novel glucagon-like peptide 1 receptor agonist) in patients with type 2 diabetes mellitus (T2DM) followed in primary care.

METHOD: Observational, retrospective study conducted in adult subjects with T2DM and obesity (IMC ≥ 30 kg/m²) who were started on liraglutide. Anthropometric data, blood tests, and blood pressure at the time of initiation of treatment and after 4 months were collected.

RESULTS: 23 patients were included in this study (mean age 56.4 ± 12.3 years, 56.5% females. After a mean of 4 months of follow-up, a significant decrease in body weight was found (-4.3 kg, baseline 102.1 kg, $p < 0.05$), in HbA1c levels (-1.3%, baseline 8.8%, $p < 0.01$), in systolic blood pressure (-7.4 mmHg, baseline 147.2 mmHg, $p < 0.01$) and in LDL concentrations (-25.8 mg/dl, baseline 138.2 mg/dl, $p < 0.05$). No significant changes, however, were observed in triglycerides, HDL cholesterol or diastolic blood pressure.

CONCLUSIONS: Liraglutide is an effective treatment in obese patients with type 2 diabetes, improving metabolic control, reducing LDL cholesterol and lowering body weight and systolic blood pressure.

Keywords: type 2 diabetes, obesity, liraglutide

Outcomes of a high-resolution thyroid clinic in patients referred from primary care

Carmen Maria Cortes Salazar¹, Jose Carlos Fernández Garcia², Diana Domínguez Jiménez³, Isabel Mancha Doblaz²

¹Primary Care Centre of Badolatosa, Seville, Spain.

²Endocrinology Department, Virgen de la Victoria University Hospital, Málaga, Spain.

³Primary Care Centre of Estepa, Seville, Spain.

BACKGROUND & AIM: The finding of a thyroid nodule is a very common occurrence in clinical practice. Management of thyroid nodules requires a multidisciplinary approach that may be eased by a high-resolution thyroid nodule clinic. We report our clinical experience and outcomes of patients from primary care referred to a high-resolution thyroid nodule clinic.

METHOD: Retrospective cohort study which included patients from primary care and suspected thyroid nodule referred to a high-resolution thyroid nodule clinic. Demographic data and clinical characteristics were collected and all patients underwent a thyroid ultrasound.

RESULTS: 987 patients were included in this study (mean age 47.3±14.7 years, women 90.6%). 38.3% out of patients had family history of thyroid disease. Nodule was detected mostly by the patient (35.6%) or by the primary care physician (29.6%). Most of the patients (98.5%) reported no symptoms of thyroid dysfunction. 57.2% of patients had palpable goiter. After performing thyroid ultrasound, a thyroid nodule was detected in 79.5% of patients (785 nodules) with a mean nodular diameter of 2±1.15 cm.

CONCLUSIONS: Most patients referred from primary care to a high-resolution thyroid nodule clinic are middle-aged women. Usually, the finding of the nodule is done by the patient himself or by the primary care physician. Goiter is frequently present and mean nodule diameter is approximately 2 cm.

Is the polypharmacy a challenge in general practice?

Gergana Hristeva Foreva, Daniela Mileva, Zornitsa Ambareva, Levena Kireva, Maria Semerdjieva, Radost Asenova
Dept of General Practice, Medical University Plovdiv

BACKGROUND: Polypharmacy and potentially inappropriate prescriptions should be considered in general practice in order to decrease the risk for adverse drug events. In addition, general practitioners don't use computerized drug interaction alerts. Nevertheless the studies related to the topic are scarce in Bulgaria. Research question: To investigate the GPs' attitude about the polypharmacy in general practice with validated tool.

METHODOLOGY: A cross-sectional study among 217 GPs in Bulgaria, using a questionnaire focused on polypharmacy, was done. The sample consisted of 77 males (35.5%) and 140 females (64.5%), average age 50.9±9.5 years.

The results were processed by SPSS 17.0 version, using descriptive statistics and nonparametric test (Chi-square).

RESULTS: Polypharmacy is known as a widespread issue but there is no generally accepted definition. Our data reveal that the most common definition used by the GPs is multiple, often unjustified, prescriptions. 53.0% of the respondents always give information for adverse drug events, 37.3% in their judgment and 7.8% in patients' demands.

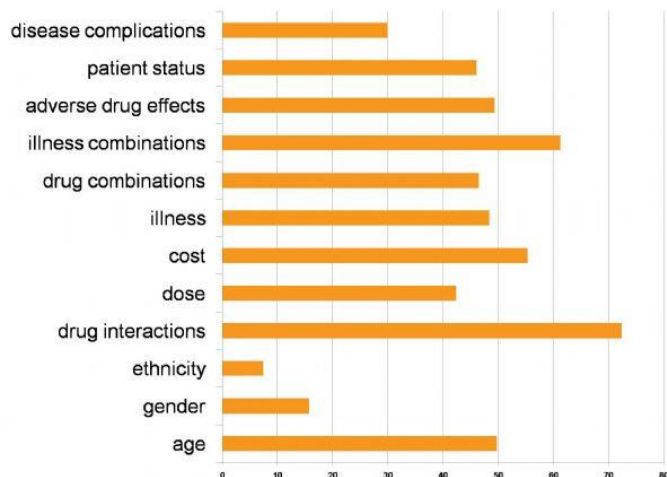

54.4% of the GPs have documented adverse drug events in the patient's records. The polypharmacy affects the quality of life of patients. According to 70% of the participants it is related to financial burden and 35.9% have emphasized on the psychological effect of the polypharmacy.

CONCLUSIONS: Polypharmacy negatively influences the health related quality of life, including with frequent adverse drug events. Specific attitude and attention is needed to facilitate the management of polypharmacy in general practice.

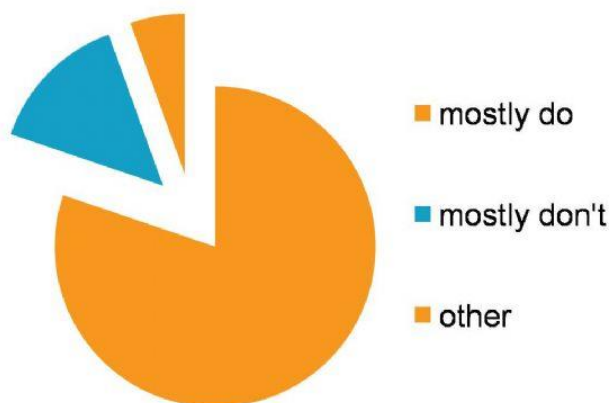

The research is supported by the university grant № HO - 15/2014 Polypharmacy and multimorbidity among geriatric patients in general practice – implementation of patient-centred approach.

Keywords: polypharmacy, general practice, adverse drug events

P-0109
Family based treatment of childhood obesity in primary care

Milena Blaž Kovač, Antonija Poplas Susič, Barbara Ferjan
Community Health Centre Ljubljana

Background

Based on the latest estimates in European union countries the number of overweight and obese children rose steadily. Family obesity is often factor for developing child obesity, which leads in adulthood with various health problems. Obesity treatment programmes for children and all family members are rare.

Aim

The programme based on family treatment was developed by a team of family doctors, graduated nurses and professors of physical education. The aim is to manage the obese children and their family members with moderate healthy goals and with sticking on the changes achieve weight reduction.

Methods

The 5- months initial programme following with 18-months maintaining programme includes children older than 7 years with BMI>95th percentile and their family members who are obese; after assesment readines for change. It is based on behaviour approaches, dietary modification, increased physical activity and monitoring body weight. The children follow the 5-4-3-2-1-0 plan: 5 fruits or vegetables per day, 4 to 5 daily meals, at least 3 hours of family physical activity per week, less than 2 hours of screen time, 1 hour daily physical activity and 0 sweeted

drinks.

The programme consists of group and individual therapy. The group therapy is repeated every two weeks for children and their family members and on alternate weeks with meeting a physician. Physical activity is organized twice a week, inside or outdoors. All family members are invited to support the changes. Targets and achieved goals are monitored.

Results

Preliminary results show the effectiveness of programme.

Conclusions

Child obesity treatment including the whole family are challenge for primary care.

Programme is supported by Norway Grants

Keywords: Childhood obesity treatment, family based obesity treatment, primary care

Multimorbidity management in general practice

Daniela Mileva, Zornitsa Ambareva, Levena Kireva, Maria Semerdjieva, Gergana Foreva, Radost Asenova
Dept of General Practice, Medical University Plovdiv

BACKGROUND: Demographic changes are leading to an increasing number of people with chronic conditions and multimorbidity. The management of the long-term conditions is a major challenge for GPs who are responsible for comprehensive care. However, the health care systems are largely configured for individual diseases rather than multimorbidity.

Research question: The aim of the study was to explore the opinion of the GPs about the management of multimorbidity in general practice consultations.

METHODOLOGY: A cross-sectional study among 217 GPs in Bulgaria, using a questionnaire focused on management of multimorbid patients, was done.

Measured outcomes - socio-demographic data, difficulties in patient management, communication barriers.

The results were processed by SPSS 17.0 version, using descriptive statistics and nonparametric test (Chi-square).

The study was conducted as part of a PhD thesis.

RESULTS: Appropriate management of multimorbid patients was one of the main challenge in general practice consultations. 53% of the GPs defined multimorbidity as the presence of two or more chronic conditions. The participants pointed out that multimorbidity affects the emotional status of patients and according to 68.7% of them patients were depressed. Only 46% claimed that patients accepted their condition.

44.7% of studied revealed that the main difficulties in counseling were related to the lack of financial resources.

32.7% reported about administrative barriers, 35.9% about difficulties associated with legislative limitations.

65.0% of the GPs considered that care for multimorbidity patients required more time, 54.8% more explanations for patients and 37.8% special attitude. 37.8% noted that multimorbidity requires an assessment of the psychological status of the patient. 39.2% of responders underlined the need of communication skills.

CONCLUSIONS: This study indicates the need for adjustment in the function of the health care system as well as the need of applying the guidelines for multimorbidity management in general practice.

Predictive factors of metabolic control in patients with type 2 diabetes mellitus

Carmen Maria Cortes Salazar¹, Jose Carlos Fernández Garcia², Diana Domínguez Jiménez³

¹Primary Care Centre of Badolatosa, Seville, Spain.

²Endocrinology Department, Virgen de la Victoria University Hospital, Málaga, Spain.

³Primary Care Centre of Estepa, Seville, Spain.

BACKGROUND & AIM: Despite elevated use of antidiabetic drugs, a significant proportion of patients with type 2 diabetes mellitus (T2DM) do not achieve adequate metabolic control. In this study we evaluate the clinical characteristics and predictive factors of metabolic control in patients with T2DM.

METHOD: Cross-sectional study including patients with T2DM from a rural population (3600 inhabitants). Data about age, sex, body mass index (BMI), years of evolution of diabetes, associated-diabetes treatment and glycosylated hemoglobin (HbA1c) was collected. A binary logistic regression analysis (HbA1c <7% or HbA1c ≥7%) was used to evaluate potential predictors of inadequate metabolic control.

RESULTS: 62 patients were evaluated: mean duration of T2DM 6.3 years (standard deviation [SD] 5), mean age 71.16 years (SD 10.2), 64.5% men. Mean weight was 77.8 kg (SD 12.9) and BMI was 30.5 kg/m² (SD 5.3). All patients were receiving antidiabetic drugs: oral antidiabetic drugs (OAD) 74.2%, OAD plus insulin 22.6%, insulin alone 3.2%. An average of 1.45 OAD was used; monotherapy 58.1% of patients, 30.6% dual therapy and 8.1% triple therapy. Most commonly used drugs were metformin (85.2%), DPP4 inhibitors (34.4%) and sulfonylureas (19.7%). Regarding insulin therapy, most patients were on basal/bolus routine (56.2%), 37.5% were on basal insulin alone and 6.3% on mixed insulin. Mean insulin dose was 62 units (SD 38.1) and mean HbA1c levels was 6.9% (SD 0.9). 60.7% of patients achieved good metabolic control (HbA1c <7%). Among predictive studied factors (gender, age, BMI, OAD therapy, insulin therapy and years of diabetes evolution), insulin treatment was the only predictor factor for having HbA1c ≥7% (OR 10.6, 95% confidence interval 1.8 to 61.7, p=0.008).

CONCLUSIONS: Most patients with T2DM from a rural setting are elderly obese men. Most of these patients are

treated with OAD (metformin mainly). Insulin use is an important predictive factor for inadequate metabolic control.

{Parsonage -Turner} Syndrome - a case report

Maria Inês Araújo Antunes¹, Sara Almeida Magalhães¹, Ana Leite Abreu²

¹USF Ponte

²USF physis

Background & AIM

Parsonage -Turner syndrome, also called brachial neuritis or neuralgic amyotrophy, is an uncommon syndrome with an annual incidence of 1.64 per 100,000 persons. An acute or sub acute neuritis of the brachial plexus is the syndrome main expression, manifesting itself by an intense arm pain, with possible cervical irradiation. It is usually followed by paralysis and muscle atrophy, days, weeks or months after onset. Although an unknown etiology, around 25-50% of the cases have a precipitating factor, more often an infection, intense exercise or traumatism. RMN and electromyography are the best exams for diagnosis and exclusion of other lesions. Treatment is symptomatic and it can be used corticosteroids in some patients. After acute phase, rehabilitation is the gold treatment to reach a full recovery, which can take between 1 and 3 years.

METHOD: Clinical interview and clinical process consultation.

RESULTS: Case report

ACSR, 28 years old, nuclear family, Stage I in Duvall cycle.

In June 2013, patient expressed pain in left arm with posterior bilateral affection and muscle weakness with paresthesia, three weeks after onset. Patient was referenced to physical medicine and rehabilitation consultation and then to Neurology, where diagnosis was confirmed by RMN and electromyography. Therefore, patient initiated corticosteroids during 2 months and also physiotherapy to relieve the pain, with significant improvement of the condition.

CONCLUSIONS: Parsonage -Turner syndrome is confused with other causes of pain and paresis of the upper limb. The family physician, first interlocutor in the primary health care, should be aware to this diagnosis due the high prevalence of similar symptoms. The early diagnosis allows the correct orientation, minimizing psychosocial damage associated to symptoms and functional and work disability.

Keywords: Parsonage -Turner syndrome, brachial neuritis, neuralgic amyotrophy.

A case of Irritable bowel syndrome

Cláudia Teixeira¹, Isabela Carvalho²

¹USF 3 Rios, ACES Tâmega II - Vale Sousa Sul, ARS Norte, Portugal

²USF Salvador Lordelo, ACES Tâmega II - Vale Sousa Sul, ARS Norte, Portugal

Background & AIM: Irritable bowel syndrome (IBS) is a gastrointestinal syndrome characterized by chronic abdominal pain and altered bowel habits in the absence of any organic cause over a period of at least three months. It is one of the most commonly diagnosed gastrointestinal conditions responsible for a significant number of visits to primary care physicians.

METHOD: Clinical process and interview with the patient. Research articles in Medline and EBM sites (evidence-based medicine), in English published in the last 5 years.

RESULTS: 49 years old Caucasian woman, nuclear family in the stage V Duvall's cycle, Graffar III, presents with symptoms of recurrent abdominal pain and distention. During the last year, she became unemployed and was submitted to hysterectomy. Her symptoms have been occurring more frequently and with greater severity resulting in several medical observations. The bloating seems to worsen with food intake, as a consequence she started to avoid eating leading to weight loss. Abdominal pain significantly improves after defecation but sense of incomplete evacuation persists. Colonoscopy and routine laboratory tests are normal. After a lifestyle and dietary modification the patient initiated antispasmodics on a needed basis.

CONCLUSIONS: Patients with irritable bowel syndrome (IBS) can present with a wide array of gastrointestinal symptoms. However, the symptom complex of chronic abdominal pain and altered bowel habits remains the nonspecific yet primary characteristic of IBS.

Perhaps because IBS is such a heterogeneous disorder, there is no single therapeutic approach and the aim of treatment is to minimize the costs and possible adverse effects of therapies. Establishment of the clinician-patient relationship and continuity of care are critical to the management of all patients with IBS.

Salivary gland growth – Clinical diagnosis

Diana Sofia Duarte¹, Miguel Marques Ferreira¹, Avelina Pereira Moniz², João Silva Bastos¹

¹Family Physician resident, USF Tejo, Lisbon, Portugal

²Family Physician, USF Tejo, Lisbon, Portugal

BACKGROUND:

Salivary glands tumors are frequent and parotid gland represents 80-85% of them. 25% are malignant. Radiation exposure, smoking viral infections and environmental factors are important risk factors. The clinical presentation is usually a painless mass, swelling, related with facial nerve involvement. The history, physical examination and imaging studies are important for diagnosis.

Description

Female, 28 years old, Asian race, married, unemployed. Extended family, no family risk factors and no relevant

personal past history. She attended our family practice with a recent (up to 5 weeks) painless swelling in the right parotid region. Observation: we felt a 4x4 cm well demarcated growth petrous mass reaching the mandibular angle, firm consistency fixed to neighboring tissues not painful on palpation. The patient shows a good opening mouth with good oral hygiene. The ultrasound scan reveals mixed tumor of the parotid gland. We refer the patient to head and neck surgery. She waits the histology exam that will give perspectives about this case.

Discussion

Most of parotid gland tumors are benign, the common presentation is an incidental mass found in physical exam. The clinical features about this issue are the most important modality of identifying malignancy. The histology of tumor is required to establish a plan therapy. Family physician is usually the first one to see the patient and is important for a preliminary diagnosis and soon refers. Family doctor integrates the knowledge about family and environmental factors to contribute for a differential diagnosis.

This case shows the importance of good clinical history and attentive physical exam to an attempted reference to the secondary care and surgical approach.

Keywords: salivary gland, parotid gland, tumor

P-0115

Scrotal mass in a young adult – benign semiology vs cancer histology

Diana Sofia Duarte¹, [Miguel Marques Ferreira](#)¹, Avelina Pereira Moniz²

¹Family Physician resident, USF Tejo, Lisbon, Portugal

²Family Physician, USF Tejo, Lisbon, Portugal

BACKGROUND:

Scrotal masses can represent a wide range of medical issues, from benign congenital conditions to life-threatening malignancies and acute surgical emergencies. Testicular swelling may be caused by local infections, cancer, or testicular torsion. Testicular tumors are the most common malignant tumors encountered in men 25 to 35 years of age. The history, physical examination and imaging studies are important for the differential diagnosis.

Description

Man, Caucasian, 32 years, married, nuclear family, recent parenting, working as upholsterer (14 years exposure). No relevant personal or family history. One week after a sport trauma, he went to his family physician with a Painful mass on the right scrotum. Observation: swelling of right scrotum without skin changes, painful mass in the right testis, with soft consistency and no transillumination.

An ultrasonography revealed well differentiated mass with hemorrhagic areas. Beta-hCG – 760.3 mU/ML. Staging imagiology was favorable and an orchiectomy was done, leading to Beta-hCG -5.3 mU/ML.

The histology was compatible with diagnosis of seminoma.

On behalf elevated beta-hCG - 310 mU/ML, 3 weeks after surgery, body PET revealed solitary pulmonary metastasis (17 x 14 mm), obliged intensive chemotherapy regimen, (5 cycles).

Semen preservation was performed.

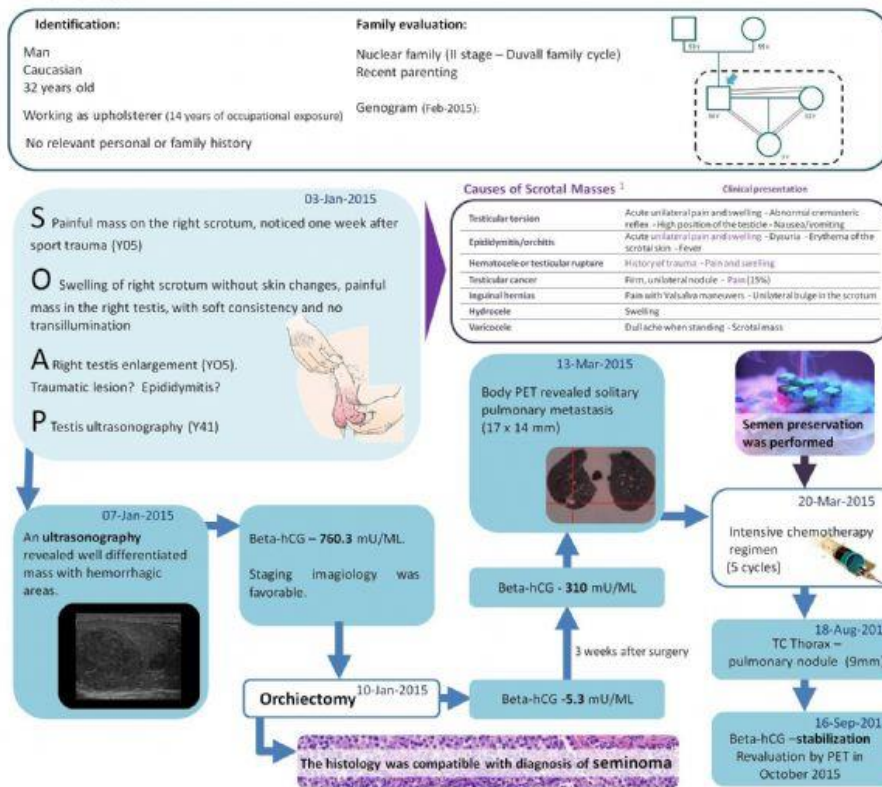

Discussion

The clinical presentation of scrotal mass with pain and association with trauma, confirmed by innocent ultrasound, is suggestive of benign etiology, possibly traumatic. However, the presence of a mass at this location associated with an increased beta-hCG, are indicators of possible malignancy - confirmed by histology. This case shows the importance of the clinical approach of testes masses; although the high prevalence of malignancy in younger males justifies exclusion of other diagnosis hypothesis.

In young couples we should respect the patient will of paternity and a semen preserve must be offered.

Lifestyle changes to improve symptoms of gastroesophageal reflux disease – is there evidence?

F. Charrão¹, C. Pina², C. Mata³

¹Esposende Norte Family Health Unit, Esposende, Portugal

²Cuidar Family Health Unit, Santa Maria da Feira, Portugal

³Santiago Family Health Unit, Leiria, Portugal

Background & Aim

Lifestyle changes are often suggested in the presence of gastroesophageal reflux symptoms.

The aim of this review is to assess the effect of lifestyle changes on the reduction of gastroesophageal reflux disease's (GERD) symptoms.

Methods

Data Sources

A search for meta-analyses, systematic reviews, clinical guidance and controlled and randomized clinical trials was conducted in Medicine Based on Evidence databases (National Guideline Clearinghouse, Guidelines Finder, Canadian Medical Association Practice Guidelines Infobase, The Cochrane Library, Clinical Evidence, DARE, Bandolier and Pubmed).

Review methods

Articles included were published between January 2006 and February 2015 in English, Portuguese and Spanish. To assess the quality of the studies and establish the strength of recommendation the "Strength of Recommendation Taxonomy" (SORT) scale of the American Family Physician was used.

Results

95 articles were obtained from the research, of which five met the inclusion criteria: one systematic review, one meta-analysis and three standards of clinical guidance. Weight loss in obese or overweight patients appears to be effective in reducing GERD symptoms.

Conclusions

The majority of studies and clinical guidelines analyzed showed a decrease of GERD symptoms when associated with weight loss, in obese or overweight patients (SOR B). However, one cannot assign strength of recommendation to the other changes in lifestyles, given the low level of evidence.

Keywords: lifestyles, gastroesophageal reflux disease, adults

Table 1. Clinical Guidance

Reference	Conclusions	Strength of the Recommendations	Evidence Level
AGA Medical Position Statement on the Management of Gastroesophageal Reflux Disease 2008	Weight loss should be advised for overweight or obese patients with oesophageal GERD syndromes. Other measures – adjust to each patient	B B	1 1
Gastroesophageal reflux disease (GERD) – UMHS, 2012 U.S. Department of Health e Human Services	All measures associated should be recommended throughout the treatment of GERD Only Weight loss and avoidance recumbency several hours after meals should be recommended	B B	2 2
Guidelines for the diagnosis and management of gastroesophageal reflux disease. Constipation - How to use laxatives?

Lisete Aires Silva, Sónia Marcelo

USF Terras de Souza, ACES Tâmega II - Vale do Sousa Sul, Portugal

INTRODUCTION and OBJECTIVES: Constipation is a public health problem. Studies have reported that the prevalence of constipation ranges from 2 to 27 percent. The use of laxatives is also very prevalent, and the aim of this study was to review the therapeutic indications of the use of laxatives, adverse effects and contraindications.

METHODS: We conducted a search in Pubmed using the MeSH terms constipation, adult and laxatives.

RESULTS: Non-pharmacological treatment of constipation, with high fiber diet and regular exercise, should be recommended.

We should start the pharmacological therapy with laxatives after the bankruptcy of non-pharmacological treatment (after 4 weeks of beginning the treatment); secondary constipation follows from a therapy impossible to stop or replace; elderly patient and hypocaloric diet; association with comorbidity, surgery or preoperative period; as well as pregnancy or breastfeeding, when the bankruptcy of non-pharmacological treatment and the presence of fecaliths.

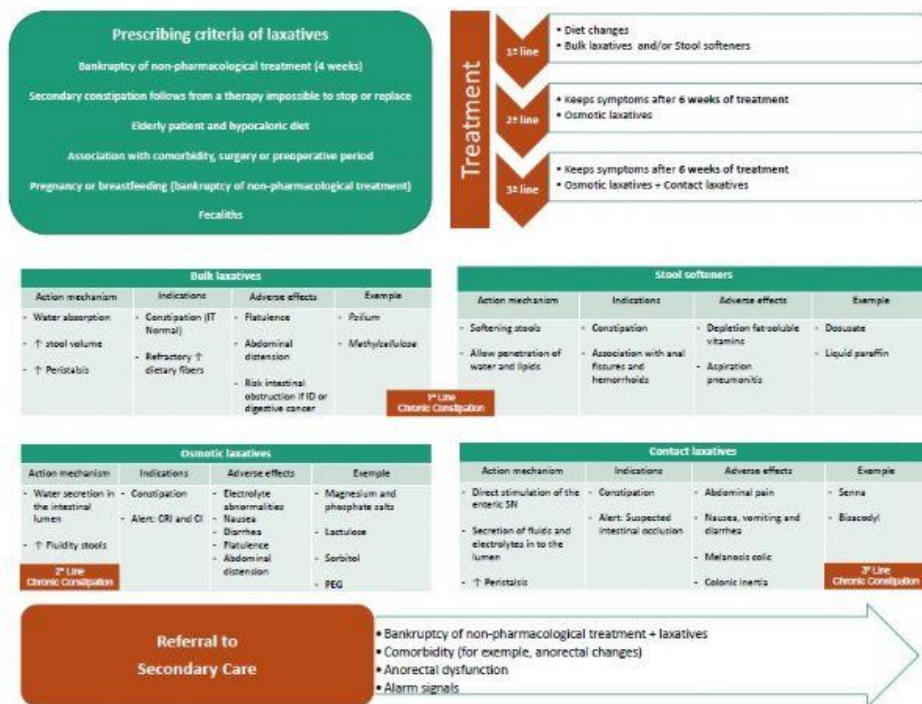

We suggest bulk laxatives or stool softeners as first line of therapy. Osmotic laxatives could be used as second line of therapy, and if necessary we should use the contact laxatives associated as a third line of therapy.

Special attention should be given to situations like constipation in the elderly, palliative, care comorbidity with diabetes mellitus, kidney or heart failure, in travel situations and pregnancy.

CONCLUSION: The correct use of laxatives is a major asset in the constipation therapy. We highlight the role of the Family Doctor in the surveillance of this disease by promoting the maintenance of healthy lifestyles and their treatment. Treatment failure is a criterion for referral to secondary care.

Keywords: Constipation, adult and laxatives.

Total Cardiovascular Risk: How to calculate and how to use it?

José Carlos Da Silva Russo, Márcia Sofia Dos Reis Gonçalves Lopes Braga
 Unidade de Saúde Familiar Descobertas, Belém, Lisboa, Portugal

Background and AIM:

The atherosclerotic disease is very common after the age of 60 and occurs due to the presence of several risk factors. The interaction between these risk factors determines the Total/Global Cardiovascular Risk. In this way, the prevention and treatment of the atherosclerotic disease focuses on Total Cardiovascular Risk and not just in each risk factor by itself. The estimated Total Cardiovascular Risk (low, moderate, high or very high), allows us to arrange the appropriate therapeutic strategies and to avoid sub therapeutic or excessive therapeutic measures. The aim of this poster is to illustrate how to calculate and how to use the Total Cardiovascular Risk in the day-to-day clinical practice of primary health care.

METHODS: Literature review of the Total Cardiovascular Risk, its calculation formula and its usefulness. This review was performed in multiple recognized databases.

CONCLUSIONS: The Total Cardiovascular Risk is determined by various diseases and cardiovascular risk factors. The SCORE model is applied to patients between 20 and 65 years of age. It evaluates: age, gender, systolic blood pressure, total cholesterol, HDL cholesterol and cigarette smoking habits.

Informing the patient about his Total Cardiovascular Risk is a crucial measure to motivate him to cooperate with changing some aspects of his lifestyle and to not forget to take the prescribed pills.

In the future, the estimated Total Cardiovascular Risk is likely to be improved by the inclusion of other factors and biological markers of cardiovascular risk. In this way, there are expected new models with higher power prediction of the Total/Global Cardiovascular Risk.

Keywords: Adult; Cardiovascular diseases/mortality; Coronary disease/mortality

Cholesterol targets by the Total cardiovascular Risk

	Total-Cholesterol (mg/dL)	LDL-Cholesterol (mg/dL)
SCORE 1 - 5%	190	115
SCORE 5 - 10 %	190	100
SCORE > 10%	190	70

The Total Cardiovascular Risk evaluation is indicated in the following situations

- Patient's will;
- ≥ 1 risk factor
- Family history of cardiovascular disease or premature familial dyslipidaemia;
- Cardiovascular symptoms;
- >45 years.

P-0119

«I'm finally growing up» - a case report of hypogonadism

Mariana Sousa Silva, Rui Queiroz Valério

UCSP Povoá de Santa Iria, ACES Estuário do Tejo, Portugal

BACKGROUND: Male hypogonadism represents an altered testicular function with infertility and decreased testosterone production. It can be caused by an intrinsic testicular damage, hypothalamic-pituitary dysfunction or decreased end organ response to testosterone. Signs include hair loss, decreased sexual function, voice changes, eunuchoidal habitus and gynecomastia. The diagnosis is clinically suspected usually after late onset of puberty and is confirmed with decreased circulating testosterone concentrations.

CASE: A 44 year-old divorced male patient, without assigned family doctor, came to consultation with complaints of hypospermia. Physical examination pointed absence of facial hair, normal penis and testicles, gynoid pubic hair distribution and absence of body hair at the remaining areas. There was also history of infertility on his previous marriage. Given this findings, we put the hypothesis of hypogonadism and requested blood tests (serum concentrations of sex hormones and pituitary hormones) and prostatic and testicular ecography. We also requested a referral to endocrinology.

The patient returned after a month with results that revealed low serum testosterone concentration and also low serum luteinizing hormone and follicle stimulating hormone concentration. The ecography showed a small volume prostate and normal testicles. We admitted the diagnosis of secondary hypothyroidism. After this, we requested a CT scan for the pituitary gland, and at this moment the patient awaits the endocrinology consultation to get the proper treatment and finally go through complete puberty.

CONCLUSION: The fact this patient didn't have an assigned family doctor delayed the diagnosis of a clinically relevant situation. Hypogonadism can significantly reduce the quality of life and has resulted in the loss of livelihood, infertility and separation of couples, leading to divorce. There is a clear need to increase the awareness of hypogonadism throughout the medical profession, especially in primary care physicians who are usually the first port of call for the patient.

How to Study Constipation in Primary Health Care?

Lisete Aires Silva¹, Joana Andrade Barros¹, Marta Santos⁴, Simão Martins³, Umbelina Mesquita²

¹USF Terras de Souza, ACES Tâmega II - Vale do Sousa Sul, Portugal

²USF Torrão, ACES Tâmega III - Vale do Sousa Norte, Portugal

³USF Hygeia, ACES Tâmega III - Vale do Sousa Norte, Portugal

⁴UCSP Boticas, ACES Alto Tâmega e Barroso, Portugal

INTRODUCTION and OBJECTIVES: Constipation is a very common problem. It is associated with some risk factors, such as women, elderly, lower educational level and dietary errors. It is a disease with high impact on life quality. The aim of this study was to review step by step management of constipation.

METHODS: We conducted a search in Pubmed using the MeSH terms constipation, adult and causality.

RESULTS: The first step in the investigation of constipation, to determine if it is a acute or chronic condition, was the duration of symptoms. Appropriate management requires an evaluation for secondary etiologies, such as systemic disorders and drugs.

Primary constipation, may be associated with normal or slow colonic transit or defecatory dysfunction.

Secondary constipation may be due to comorbidities as endocrine or metabolic diseases (diabetes mellitus, hypercalcemia or hypothyroidism), neurological diseases (autonomic neuropathy, Hirschsprung disease, multiple sclerosis or Parkinson's disease), psychiatric disorders (anxiety, depression or somatization) structural changes (anal fissures and pelvic inflammatory disease) or drugs (antidepressants, antihistamines, antipsychotics, diuretics, opiates, calcium channel blockers, antacids, aine's, calcium and iron supplements).

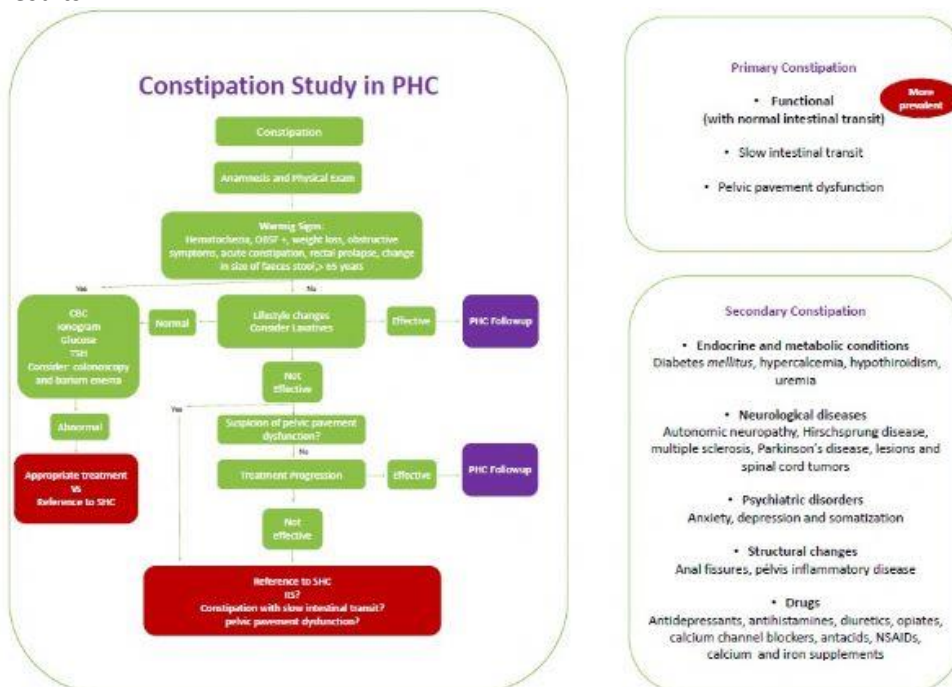

The presence of warning signs, as well as chronic and severe constipation, guides to the request for additional investigation, with blood tests, X-ray and endoscopic tecnics.

CONCLUSIONS: Functional constipation is the most frequent cause of chronic constipation. However other causes should be properly excluded, towards the best therapeutic orientation.

Special focus on alarm signals history and fysical examination must guided the study of constipation within primary health care, with special attention to referral criteria to secondary care.

Keywords: Constipation, adult and causality.

Initial approach and monitoring of Obstructive Sleep Apnea Syndrome in Primary Health Care

Sara Quelha, Felicidade Malheiro

USF Arca d'Àgua; ACeS Porto Oriental; Porto; Portugal

Background and AIM: The Obstructive Sleep Apnea Syndrome (OSAS) is a sleep disorder, and its prevalence estimated in Portugal is 20%, predominantly in obese men between 40-60 years. OSAS is associated with various diseases, such as hypertension, being fundamental a correct follow-up of these patients to better control these diseases. The objective is to optimize the evaluation of patients with suspected OSA and monitoring in Health Primary Care (PHC) after introduction of non-invasive mechanical ventilation (NIV).

METHOD: Bibliographic Search System Dynamed and search engines Cochrane Library and PubMed.

RESULTS: The suspicion of OSAS should fall before complaints of snoring and daytime sleepiness and results ≥ 11 the Epworth Sleepiness Scale. The diagnosis is established by polysomnography with an Apnea/hypopnea Index (AHI) $\geq 5/h$ and the NIV is the treatment of choice. When stabilized and after hospital discharge, the patient's adherence to NIV and its control should be reviewed annually by the Family Physician (FP), always emphasizing the importance of hygiene and dietary measures for therapeutic success. Ideally the patient should use the NIV $\geq 90\%$ of nights and $\geq 6h$ / night, with tolerable use $\geq 70\%$ of nights and $\geq 4h$ / night. It is considered controlled when presenting a normal AHI, or $< 5 / h$. The referral should be considered when clinical worsening, variation $> 10\%$ by weight, $AHI \geq 5 / h$, use of NIV $< 70\%$ of the nights, use of NIV $< 4h$ / night or when the patient does not tolerate NIV.

CONCLUSIONS: OSAS is associated with various diseases causing high cardiovascular morbidity. The FP should assess compliance and effectiveness of NIV, referencing the patient when necessary therapy optimization.

Keywords: obstructive sleep apnea syndrome; apnea/hypopnea index; non-invasive mechanical ventilation

Patients with optimal control and tolerable control

Ideally	Tolerable
Asymptomatic Epworth Sleepiness Scale < 11 Weight variation $< 10\%$

³Akinci Outpatient Clinic, Primary Care & Family Health Center, Etimesgut Military Hospital, Ankara, Turkey

⁴Department of Psychiatry, Gulhane Military Medical Faculty, Ankara, Turkey

⁵Department of Internal Medicine, Gulhane Military Medical Faculty, Ankara, Turkey

AIM: Generalized anxiety disorder (GAD) is one of the most prevalent psychiatric disorder in the world. In order to treat GAD and related illnesses, many drugs are used. In this research we aimed to identify which drugs are used for GAD and related illnesses.

METHOD: Between 2009 to 2012, 73 patients enrolled in this study. Diagnoses were done by using Beck Anxiety Scale and DSM-IV criteria. Data was analysed by using SPSS 20 for MAC.

RESULTS: There were 61 (83.6%) female and 12 (16.4%) male. Fifty nine (81%) of patients were using SSRI, 8 (11%) were using SNRI, 4 (5.5%) were using TAD, 5 (6.8%) were using Tetracyclic Antidepressant, 3 (4.1%) were using Trazodon, 8 were using alprazolam, 1 (1.4%) was using Clonazepam, 1 (1.4%) was using Risperidon, 1 (1.4%) was using Stilizan, 1 (1.4%) was using Haloperidol, 1 (1.4%) was using Antihistaminic, 3 (4.1%) were using B-Blocker, 4 (5.5%) were using OAD, 12 (16.4%) were using antihypertensive therapy, 2 (2.7%) were using antihyperlipidemics, 2 (2.7%) were using vasodilators, 7 (9.6%) were using anti-thyroid drugs, 7 (9.6%) were using B12 vitamins.

CONCLUSIONS: SSRIs and antihypertensive drugs are the most used drugs in GAD.

Is there a role for tamsulosin in the treatment of distal ureteral stones?

Ana Margarida Pinho, Célia Gomes Silva

ACES Entre Douro e Vouga I Feira/Arouca, USF Famílias, Lourosa, Santa Maria da Feira, Portugal

Background & Aim

The incidence of urinary tract stones in the general population appears to be increasing. Therefore, urolithiasis is a chronic disease with substantial economic consequences and great public health importance.

In the last few years, medical expulsive therapy for ureteral stones has been developed, which includes α 1-adrenergic antagonists.

Alpha blockers mainly produce relaxation of the distal human ureter by reducing ureteric smooth muscle tone.

Tamsulosin (0.4 mg/day), an α 1-adrenergic antagonist, has been used because of its tolerability.

The aim is to review the available evidence on the efficacy of Tamsulosin in the expulsion of distal ureteral calculi.

Method

A search for clinical practice guidelines, meta-analyses, systematic reviews, evidence-based reviews and clinical trials published between January 2010 and March 2015, in English, Spanish and Portuguese was performed using the MeSH terms: Tamsulosin and Urolithiasis. The Strength of Recommendation Taxonomy of the American Family Physician was used for the assessment of levels of evidence and the strength of recommendations.

Results

Of the sixty-two articles found, only ten fulfilled the inclusion criteria and were selected. These included one practice guideline, one meta-analysis (MA) and eight randomized clinical trials (RCT).

The practice guideline recommended Tamsulosin for the medical expulsive therapy for ureteral stones. The MA found evidence for the efficacy of Tamsulosin in facilitating the expulsion of ureteral calculi. Seven RCT found that Tamsulosin increase spontaneous passage of distal ureteral stones. Only one RCT showed that Tamsulosin did not accelerate the expulsion of distal ureteral stones.

Conclusions

Evidence from available studies suggests that Tamsulosin can facilitate the expulsion of distal ureteral calculi

(Strength of Recommendation B).

However, more studies are needed to establish the efficacy in others populations and to compare Tamsulosin with other medical expulsive therapy.

Keywords: Tamsulosin, Urolithiasis, Urinary Calculi

Inclusion Criteria

P Population/patient Adult patients with distal ureteral stones
 I Intervention/indicator Tamsulosin
 C Comparator/control Placebo or other Medical expulsive therapy
 O Outcome Expulsion of distal ureteral stones

Meta-Analysis and Randomized Clinical Trials

Studies	References	Population/ Intervention	Results	Conclusions	Levels of Evidence
MA	Fan B et al. 2013	20 trials n=799 Tamsulosin vs Conventional Treatment	Tamsulosin vs Conventional Treatment RR=1.51; 95% CI 1.40–1.63 p < 0.0001	Tamsulosin facilitates the expulsion of ureteral calculi.	2
RCT	Kumar S et al. 2015	n= 285 patients Tamsulosin (Group A) vs Silodosin (Group B) vs Tadalafil (Group C) Follow-up: 4 weeks	There was a statistically significant expulsion rate of 83.3% in group B compared with 64.4% and 66.7% in groups A and C, respectively, with lower time of stone expulsion (P value =.006 and P value =.016, respectively)	Medical expulsive therapy for the distal ureteric stones using tamsulosin, silodosin, and tadalafil is safe, efficacious, and well tolerated.	2
RCT	Alizadeh M et al. 2014	n=96 patients Tamsulosin and indomethacin vs fluids (hydration) and indomethacin Follow-up: 4 weeks	Spontaneous expulsion of stone was occurred in 62.5% (30 patients out of 46) of control group patients and 82% (41 patients out of 50) that there was no significant difference (P>0.05).	Addition of tamsulosin to conservative treatment of distal ureteral stones in the distal ureteral stone expulsion showed no significant difference between the two groups.	2
RCT	Imperatore V et al. 2014	n=100 patients Silodosin vs Tamsulosin Follow-up: 4 weeks	Stone-expulsion rate in the silodosin and in the tamsulosin groups were 88% and 82%, respectively (p not significant).	Tamsulosin and silodosin are equally effective as MET for distal ureteric stones sized 10 mm or smaller.	2
RCT	Gupta S et al. 2013	n= 100 patients Tamsulosin (Group 1) vs Silodosin (Group 2) Follow-up: 4 weeks	A spontaneous stone expulsion was observed in 58% of the patients in group 1 and in 82% of the patients in Group 2, which was statistically significant.	Silodosin was found to be clinically superior to tamsulosin, both in terms of the stone expulsion rate and the stone expulsion time.	2
RCT	Zhou SG et al. 2011	n= 131 patients Naftopidil (group 1) vs Tamsulosin (Group 2) vs Control group	A statistically significant difference was noted in the stone expulsion between groups 1 and 3, and groups 2	Tamsulosin could significantly increase spontaneous passage of distal ureteral stones.	2

		(Group 3) Follow-up: 2 weeks	and 3 (P = 0.000 and P = 0.000, respectively).		
RCT	Ye Z et al. 2011	n= 3189 patients Tamsulosin (Group 1) vs Nifedipine (Group2) Follow-up: 4 weeks	There was a significant variation in stone-expulsion rates between groups 1 and 2 (P < 0.01).	Tamsulosin and nifedipine in MET was determined to be safe and effective for distal ureteric stones with renal colic.	2
RCT	Kaneko T et al. 2010	n= 71 patients Tamsulosin (Group 1) vs Control Group (Group 2) Follow-up: 4 weeks	The stone expulsion rate was significantly higher in group 1 than in group 2 (77% vs 50%, P = 0.002).	Low dose tamsulosin can significantly facilitate spontaneous passage of ureteral stones without significant side-effects.	2
RCT	Vincendeau S et al. 2010	n= 129 patients Tamsulosin (Group 1) Vs Placebo (Group 2) Follow-up: 42 days	Expulsion delay distributions during 42 days did not show any difference (P =.30).	A daily administration of 0.4 mg of tamsulosin did not accelerate the expulsion of distal ureteral stones in patients with ureteral colic.	1

Practice Guideline

Practice Guideline	Year	Conclusion	Strength of recommendation
European Association of Urology	2013	Tamsulosin is recommended for the medical expulsive therapy for ureteral stones.	B

Restless Legs Syndrome: Primary Healthcare Approach

Susana Cordeiro Rita¹, Ana Matos Coronha², Ana Paula Cardoso¹, Mariana Anete Mira¹, Ana Sofia Pena¹

¹USF Samora Correia, ACES Estuário Tejo, ARSLVT, Santarém, Portugal

²Extensão Porto Alto, UCSP Benavente, ACES Estuário Tejo, ARSLVT, Santarém, Portugal

Introduction and PURPOSE: Restless Legs Syndrome (RLS) is characterized by an urge to move the legs, frequently secondary to an unpleasant sensation. Although relatively common (5-10% of the European population), its diagnosis is difficult, frequently mistaken for other conditions. In this paper, the authors review the management of RLS from the family physician (FP) perspective.

MATERIALS-METHODS: the authors performed a narrative review, searching Pneumology and Neurology monographies and English articles between 2000 and 2014 from Pubmed, Medline, Medscape and UptoDate databases.

RESULTS: by providing both transversal and longitudinal healthcare, the FP is in a privileged position to identify RLS. When this condition is suspected, the FP should:

a) enquire about RLS associated symptoms, according to the International Restless Legs Syndrome Study Group – 2012: 1) an urge to move the legs usually but not always accompanied by uncomfortable and unpleasant sensations in the legs; 2) symptoms begin or worsen during rest or inactivity; 3) symptoms are relieved or resolved with movement; 4) symptoms only occur or worsen during the evening or nighttime; 5) the before

mentioned criteria are not caused by any other condition, and results in functional and quality of life repercussions;

b) perform a complete physical examination, with a special focus on the cardiovascular, respiratory and neurological systems;

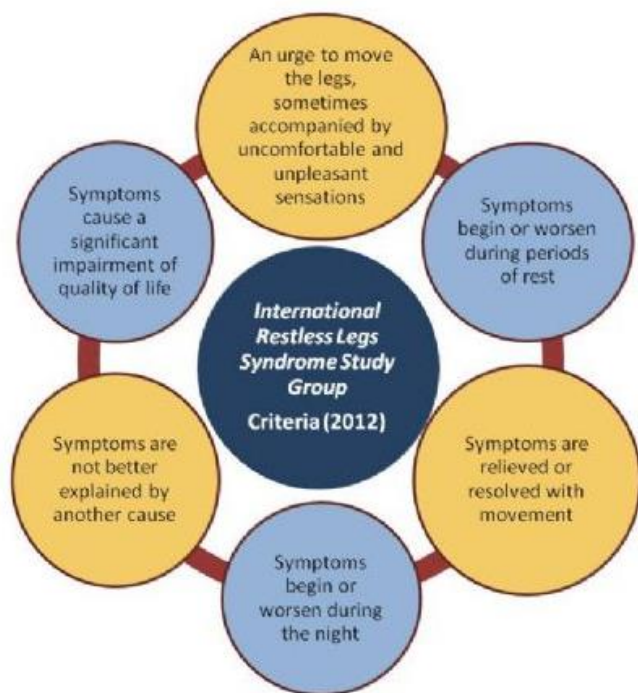

c) request diagnostic tests to exclude confounding factors (Eg: iron metabolism tests, thyroid function tests or polysomnography);

d) classify RLS as either primary (etiology unknown or likely familial) or secondary (associated with pregnancy, iron-deficiency, diabetes mellitus, multiple sclerosis, Parkinson's, pharmacological, among others);

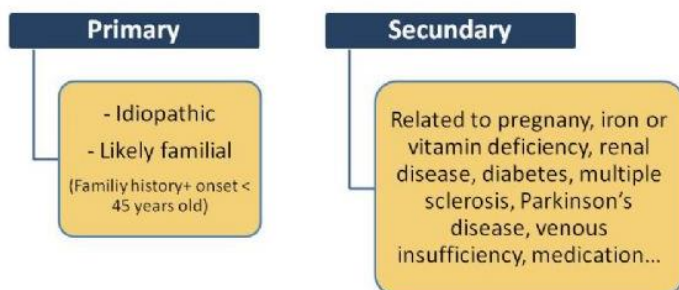

CONCLUSIONS: resulting from the management of the patient as a whole and the proximity and accessibility of primary healthcare, the FP has an essential role in the early diagnosis and follow-up of RLS, minimizing its detrimental impact in the quality of life of the patient.

Chronic-disease management in the patient's home environment

Simona Repar Bornšek, Tonka Poplas Susic

DEPARTMENT OF GENERAL PRACTICE, COMMUNITY HEALTH CENTRE LJUBLJANA, LJUBLJANA, SLOVENIA

Background & AIM: People with a chronic disease are the most frequent users of national health services.

Furthermore, chronic, non-communicable diseases are the leading cause of mortality in the developed world. Most complications can be prevented by a timely intervention, so early treatment is of vital importance.

METHODS: Effective chronic-disease management requires a sustained follow-up and continuous stimulation of the patient's compliance. Therefore a graduated nurse and community nurse were introduced in the physician's team to provide follow-up in the office and at patient's home.

RESULTS: Indicators that are systematically followed are: survey on patients and staff satisfaction – annually, establishing registers of patients with diabetes, asthma, COPD, hypertension, benign hypertrophy of prostate, osteoporosis, depression, and coronary heart diseases, annually measured blood pressure in all registered chronic patients, annually checked smoking status in all registered chronic patients, annually verified side effects of medications used in asthma patients, annually performed spirometry in patients with COPD, annually verified side effects of medications used in COPD patients, All data are entered in the computer program and automatically reported to the national central office. First analysis is expected in 2016.

CONCLUSION: The community nurse also monitors the patient's risk factors in their home environment. Due to his/her direct contact and the possibility to enter the patient's home environment, the nurse can identify the causes of a patient's failure to meet treatment goals, give advice about a safe environment (prevention of falls in patient with osteoporosis) or recommend a lifestyle change. A close collaboration between the family practitioner's team and a community nurse presumably increases patient satisfaction and compliance, allows treatment surveillance and monitoring of medication side effects.

Disclosure: Chronic-disease management in the patient's home environment is a part of a project funded by the Norwegian financial mechanism programme.

Keywords: : chronic disease, community nurse, treatment at home

CHRONIC-DISEASE MANAGEMENT IN THE PATIENT'S HOME ENVIRONMENT

Simona Repar Bornšek, Tonka Poplas Susic

Community Health Centre Ljubljana, Ljubljana, Slovenia

Patient’s satisfaction with work of graduated nurse in family physician’s team

Andrej Škrinjar¹, Liljana Klančnik¹, Antonija Poplas Susič¹

¹Andrej Škrinjar, MD, Community Health Center Ljubljana, Ljubljana, Slovenia

²Liljana Klančnik, graduated nurse, Community Health Center Ljubljana, Slovenia

³doc.dr. Antonija Poplas Susič, MD, Community Health center Ljubljana, Slovenia

Background & AIM: Graduated nurses can undertake substantial part of the management of chronic diseases and decrease the workload of family physicians. In 2011, a graduated nurse was introduced in the family physician’s team as a part of national project supported by Ministry of Health. In 2015, with a financial support of Norway Grants also a graduated nurse has been implemented with a purpose to manage patients at home (chronic diseases and preventive screening) as a pilot project in The Health Centre Ljubljana.

METHODS: The study evaluates a patient’s satisfaction in the Health Centre Ljubljana with the work of graduated nurse. Patients fulfilled questionnaires and assessed on the scale from 1(not good) to 5 (excellent) 3 groups of questions: the content of work, the time providing to patients and usefulness of information given by nurse.

RESULTS: In one month period, 235 patients assessed the work of 20 graduated nurses in Health Centre Ljubljana. The average score of patients satisfaction with graduated nurse is assessed by 77% of patients as excellent (grade 5) and by 23% as very well (grade 4). The average assessment of earlier mentioned areas are as follows: a content of work -77% excellent, 20 % very well, 2% good (grade 3) and 1% of patients did not answered; time providing to patients- 78% excellent, 19% very well, 2% good and 1% of patients did not answered; usefulness of information- 75% excellent, 21% very well, 2% good and 2% of patients did not answered the questions.

CONCLUSIONS: The majority of patients are very satisfied with the contribution of graduated nurses and we do believe that this is the appropriate way to upgrade primary care.

The Role of the Family Physician in the Diagnosis and Management of Orofacial Dyskinesia: a Case Report

Susana Cordeiro Rita, Ana Paula Cardoso, Virgínia Carreiras

USF Samora Correia, ACES Estuário Tejo, ARSLVT, Santarém, Portugal

Introduction and PURPOSE: dyskinesia is a greek term applied to abnormal involuntary hyperkinetic movement disorders, which may involve any part of the body. Diverse etiologies include Parkinson's disease, organic acidemia, conversive syndrome or anti-dopaminergic medications, which should guide the clinical investigation. The purpose of our case report is to demonstrate the role of the family physician in the multidisciplinary care of a patient with orofacial dyskinesia.

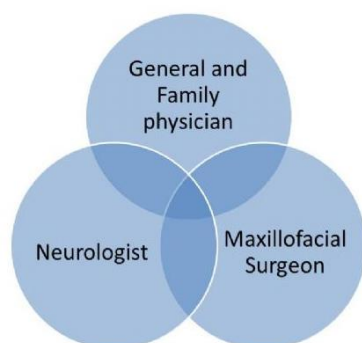

MATERIALS-METHODS: case report.

CASE: the authors present the case of a 74 year-old female, with a personal history of arterial hypertension, cardiac arrhythmia, vertiginous syndrome and reactive depression to the death of a son 18 months ago, medicated with valsartan, hydrochlorothiazide, lercanidipine, amiodarone, dabigatran etexilate, beta-histine and escitalopram. 12 months after the passing of her son, the patient reports the onset of bruxism and a mild degree of orofacial dyskinesia, characterized by involuntary lateralization movements of the jaw and tongue, and involuntary biting. This presentation was accompanied by trismus and temporo-mandibular joint limitation of movement and crepitation. A CT scan and Maxillofacial specialist consultation were requested, both discarding osteoarticular disease. The patient was then referred to a Neurology consultation and by this time her clinical picture had worsened to the point of a marked difficulty with speech and consequent social reclusion. After the appropriate laboratorial and imaging tests, the diagnosis is considered to be a conversive syndrome. The patient was prescribed clonazepam 1mg, 2 times a day, reporting a discrete improvement in the symptoms.

CONCLUSIONS: this clinical picture illustrates the role of the family physician as a pivot in complex cases, contributing to the early diagnosis and inter-disciplinary management of these patients. The importance of the familial and social context in this case, both contributed to the etiological investigation and the mitigation of detrimental effects in the patient's daily life.

P-0128

"Scleroderma": A hard approach in a hardened skin

Helena Marques, Cristina Ferreira Tavares

USF S.Félix da Marinha, ACeS Espinho/ Gaia, São Félix da Marinha, Portugal

Background & Aim: Systemic Sclerosis (SSc) is a rare connective tissue disease, characterized by hardened skin, vascular dysfunction and involvement of multiple organ systems with fibrotic complications. SSc's prevalence ranges from 30 to 240 per million inhabitants, being females mostly affected.

Considering that SSc has the highest disease-related mortality of connective tissue conditions and its significant impact, it is crucial the early recognition.

Method: Interview/ Family evaluation and consultation of clinical data.

Results: A 43-year-old woman, married, from a nuclear family in stage I of Cycle of Duvall and a public transport driver. Previous history of esophagitis, hiatal hernia and dyslipidemia. Family's history of psoriasis (father's patient). The patient consulted her family doctor in May-2013, complaining of fatigue, myalgia, hand's arthralgia and thumb's paresthesia. On physical examination, it were found hand's swelling (without other skin alterations) and a dubious Raynaud.

She was referenced to Rheumatology and was observed in August-2013. It were requested immunologic studies, serology and protein's electrophoresis. In differential diagnosis, it were mainly considered Rheumatoid Arthritis, Psoriatic Arthritis and SSc. In September-2014, the patient presented with thickened/hardened skin (fingers-3+; forearm/face-0/1 – Modified Rodnan skin score) and Raynaud phenomenon. Capillaroscopy's results were compatible with SSc. Therefore, patient was diagnosed with Limited Cutaneous SSc (lcSSc), probably associated with CREST Syndrome and was treated with Methotrexate. This burden of uncertainty to diagnosis, enhancer of anxiety and familiar instability, accompanied with symptomatology's fluctuation/deteriorating, led to patient's temporary professional incapacity.

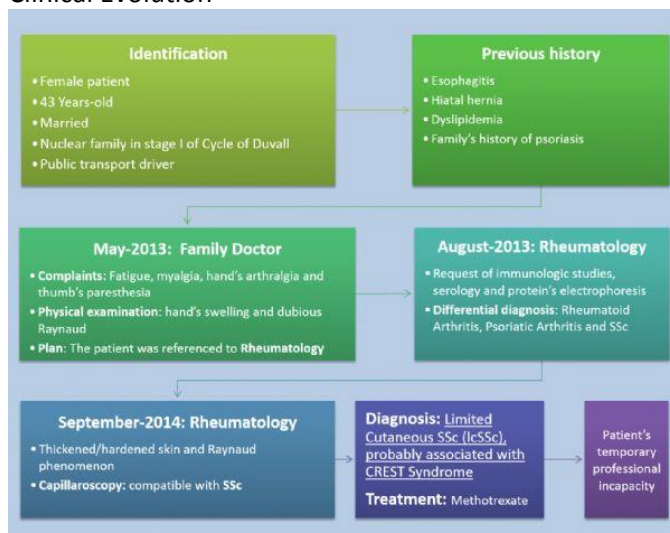

Conclusions: Musculoskeletal complaints, a considerable bulk as far as General Practice consultations are concerned, are often integrated in incipient presentations, which could be either valuable or confounding. Diffuse symptomatology's approach highlights the applicability of the core capacities of the family doctor such as problem solving skills in undifferentiated disease's stages, person-centered care and holistic approach.

Clinical Evolution

Supplementation of vitamin D in fibromyalgia, is it important? A systematic review

Mariana Gayo, Ana Beatriz Figueiredo, Maria Manuela Bernardo
 USF das Conchas, Lisbon, Portugal

AIM: To review the literature that supports an association between the deficit of vitamin D and fibromyalgia and if its diagnosis and treatment should be routinely considered on these patients.

METHODS: Literature review in Medline and Cochrane, through Pubmed and Medscape using the Mesh-Terms: “Fibromyalgia” and “Vitamin D”. Inclusion criteria: guidelines, systematic reviews and original studies written in english, published between 2005 and January 2015.

RESULTS: Based on inclusion criteria, 12 original studies, 5 systematic reviews and 1 guideline review were included. The results obtained were conflicting. In 5 studies there is no association between fibromyalgia and vitamin D deficiency, but in the other 7 studies with different features they found a high prevalence of hypovitaminosis D among fibromyalgia patients. Most of the authors defend that an early nutrition program rich in calcium and vitamin D associated with medical treatment should be considered in fibromyalgia patients. A recent randomized placebo-controlled trial further states that vitamin D supplementation may be regarded as relatively safe and economical treatment in fibromyalgia. The current guidelines and Cochrane database defends that, the evidence base for the use of vitamin D supplementation for fibromyalgia is rather poor and there’s no evidence sufficient quality to guide clinical practice.

Discussion and CONCLUSION: All the studies so far are limited to a small number of participants and a highly selected patient population, so further investigation is needed to show the effect of vitamin D supplementation in fibromyalgia patients. We conclude that the association between low levels of vitamin D and fibromyalgia remains unclear; nevertheless treating hypovitaminosis D is relatively safe and inexpensive and may improve patients’ long-term bone health, muscle strength and therefore their symptoms.

Thyroid hemiagenesis: a rare finding in primary health care

Joana Parente¹, Paula Ferreira¹, Joana Araújo¹, Catarina Ferreira Leite², Raquel Abreu³, Andreia Fernandes⁴, Marta Ferreira¹

¹São Lourenço Family Health Care Unit, Braga, Portugal

²AmareSaúde Family Health Care Unit, Amares - Braga, Portugal

³Pro Saúde Family Health Care Unit, Vila Verde - Braga, Portugal

⁴Alcaides Faria Family Health Care Unit, Barcelos, Portugal

BACKGROUND & AIM: Thyroid development abnormalities are rare and include thyroid hemiagenesis, a congenital anomaly characterized by the absence of a thyroid lobe associated in 50% of cases with absence of the isthmus. Its prevalence is 0,5 to 0,2% with very few cases described to date. Most frequently, it is observed in the left lobe (4:1) and in female (3:1). It may be associated with thyroid dysfunction, but many cases are euthyroid and the diagnosis is incidental. Thyroid ultrasound has a role in the diagnosis and follow-up of these patients. Our aim is to report an incidental finding of thyroid hemiagnesis in a 33-years-old caucasian woman and present a review of literature. The patient, with a medical history of asthma, had her first appointment with her new family physician at january 2014. Biochemical analyzes were requested, which reported a TSH level slightly elevated. For enlightenment, the patient repeated thyroid function and it was requested a thyroid ultrasound. The results revealed thyroid hemiagenesis and subclinical primary hypothyroidism. It was decided to manage it with thyroid function and thyroid ultrasound every six months. In follow-up, patient remains asymptomatic.

METHODS: Case report and review of literature.

RESULTS: Thyroid ultrasound revealed "left lobe of the thyroid not displayed and since there is no surgical history, there is probably an agenesis of the left lobe. Right lobe and isthmus are normal." The results of thyroid function were TSH of 5,3 mU/L (0,4-4mU/ml) and T4 of 1,23 ug/dl (0,7-1,8ug/dl).

CONCLUSIONS: Thyroid hemiagenesis is a rare congenital anomaly in most cases associated with an euthyroid state, but it can also be related to hypothyroidism, hyperthyroidism, adenomas, carcinomas, thyroiditis, among others. The awareness of this association should lead to a regular and proper follow-up with thyroid function and ultrasound.

Keywords: Thyroid hemiagenesis, agenesis hemithyroid, thyroid congenital anomaly

Platelet dysfunction in type 2 diabetes

Mehmet Aytug Dikililer¹, Adem Parlak², Muammer Korkmaz³, Umit Aydogan², Oktay Sari², Kenan Saglam⁴

¹Ankara Mevki Asker Hastanesi Anittepe Polikliniği Birinci Basamak Muayene ve Aile Sağlığı Merkezi / ANKARA

²Department of Family Medicine, Gulhane Military Medical Academy, Ankara, Turkey

³Department of Neurology, Gulhane Military Medical Academy, Ankara, Turkey

⁴Department of Internal Medicine, Gulhane Military Medical Academy, Ankara, Turkey

Background and AIM: Platelet activity and aggregation potential are essential components of thrombogenesis and atherosclerosis and can be conveniently estimated by measuring mean platelet volume (MPV). It has been shown that MPV was significantly higher in Diabetes Mellitus (DM). The aim of this study was to investigate MPV in type 2 DM.

METHODS: 110 patients (60 Diabetics, 50 controls) admitted to Gulhane School of Medicine Internal Medicine outpatient clinic from June 2009 to April 2010 have been included in this study. Heart failure, renal failure, hypertension, CVO and other chronic diseases which were excluded by history and physical exam and patients with anormal Hb and trombosit were not included our study.

RESULTS: There were 19 male (% 31,7), 41 female (% 68,3) in diabetic group; 18 male (% 36), 41 female (% 64) in control group. Mean MPV in diabetic group ($8,54\pm 1,07$ fL), were higher than control group ($7,99\pm 0,87$ fL) ($p=0.004$). There was a close relationship between HbA1c and MPV ($r=0,562$ $p<0,001$).

CONCLUSION: Our results have showed a close relationship between poor glycemic control and increased platelet activity in patients with type 2 DM. Furthermore, Platelet activity recovered through improved glycemic control, which may prevent the possible role of platelets in vascular events in these patients.

Musculoskeletal Disorders In Diabetes Mellitus

Marisa Batarda¹, Diana Costa Marques¹, Diogo Silva², Jenny Duarte¹, Ricardo Vicente¹

¹USF Tornada, Caldas da Rainha, Portugal

²USF Pedro e Inês, Alcobaça, Portugal

BACKGROUND AND AIM:

Diabetes Mellitus (DM) is a metabolic disorder of increasing prevalence accompanied by important multiorgan compromise. Various musculoskeletal manifestations have been associated with this disease, causing significant functional limitations in Diabetic patients. This review discusses the principal musculoskeletal changes in DM.

METHOD: The search engine used for this review was PubMed, with the following MeSH terms: diabetes mellitus, Dupuytren's contracture, trigger finger, bursitis and carpal tunnel syndrome. Five reviews pertaining to the last ten years were selected.

RESULTS: Many authors have tried to classify the musculoskeletal manifestations in DM, which proves difficult, due to the fact that the majority of the physiopathological mechanisms still remain unclear.

In patients with DM, the following musculoskeletal changes have been described: limited joint mobility syndrome, Dupuytren's contracture, trigger finger or stenosing flexor tenosynovitis, carpal tunnel syndrome, calcific tendinitis and adhesive capsulitis of the shoulder, muscular infarction, diffuse idiopathic skeletal hyperostosis, Charcot's arthropathy or diabetic neuropathic arthropathy.

CONCLUSIONS: This review points out the importance of an early diagnosis and timely therapeutic orientations for these different DM-related musculoskeletal manifestations.

Keywords: diabetes mellitus, Dupuytren's contracture, trigger finger

³Home for Health Care Zagreb Center, Zagreb

INTRODUCTION: It is well-known that Oswestry questionnaire (OQ) is an extraordinary useful and widely used tool for initial check and identification of subjective patients' potentials and difficulties/disabilities, which is as a standard applied mainly in low back surgery and physical medicine.

MATERIALS-METHODS: In this paper in details are reviewed the results of OQ application at a group of 46 patients (before and after selected medical treatments) in 3-months period of GP group praxis in 2014-2015. According to subjective patients' perception of their problem levels intensities, the most of them were treated by NSAIDs. Only few of them were treated with physical therapy to which they were referred from their GPs.

Results. Through OQ GPs patients were able to express in a simple way their subjective perception of back pain level and its negative consequences on their daily activities. On the other hand, GPs can recognise patient's problems and immediately react in three directions:

- by recommending preventive behaviour and moderate activities to minimize risks of further minor pains development to patients with low level of symptoms intensity,
 - by proscribing and providing adequate medical treatments for the majority of low back pains patients etc
- With post-treatment OQ as a feedback GP can easily control the efficiency of all described activities with the aim of eventually further activities for improvements of patients' condition.

Conclusion: Besides physical rehabilitation related issues, OQ (when applied cyclically, e.g. once in every 3-5 years) may also contribute to insight of overall patient's lifestyle – quality, behaviours, capabilities and changes: this makes OQ an important source of knowledge about their patients to GPs (taking them in combination with patients' ages, personal, social, employment, tradition and other specific circumstances) and thus the input for possibly needed preventive activities and/or advices for improvements in different areas.

Keywords: post-treatment, back pain level, minor pains development

Results

Through OQ GPs patients were able to express in a simple way their subjective perception of back pain level and its negative consequences on their daily activities. On the other hand, GPs can recognise patient's problems and immediately react in three directions:

- by recommending preventive behaviour and moderate activities to minimize risks of further minor pains development to patients with low level of symptoms intensity,
 - by proscribing and providing adequate medical treatments for the majority of low back pains patients,
 - by indicating physical therapy treatments only for minor group patients with the highest level of pains (present in different daily situations).
- With post-treatment OQ as a feedback GP can easily control the efficiency of all described activities with the aim of eventually further activities for improvements of patients' condition.

Within the observed and treated group of 46 patients, initial average general pain level was reported as 3.3 (according to standard OQ), with the greatest problems at lifting (average score: 3.2) and standing (average score: 3.0). After treatments provided during 3 months the reported average general pain level is less than 1 point lower.

Diagnosis and Management of Generalized Anxiety Disorders in Primary Care - Practical Guide

Sílvia Martins¹, Carla Silva¹, Dalila Teixeira²

¹Unidade de Saúde Familiar Lagoa - Unidade Local de Saúde de Matosinhos

²Unidade de Cuidados de Saúde Personalizados de Matosinhos - Unidade Local de Saúde de Matosinhos

INTRODUCTION: Generalized anxiety disorder (GAD) is amongst the most common of mental disorders in primary care (PC); however it is often not recognized because of the range of different anxiety disorders, co-morbidity, widespread lack of awareness of anxiety affected individuals and health practitioners, and the low confidence of many practitioners in their management. This emphasizes the need to provide strategies to improve clinical practice.

OBJECTIVE: Provide a practical, evidence-based guide on key steps in diagnosis and management of GAD, to PC physicians.

METHODS: A search was performed through databases, of English and Portuguese publications (2004-2015), using as search terms: “Generalized Anxiety Disorder”, “Treatment”, “Management”, “Primary Care”.

RESULTS: The general practitioners faces a significant challenge to establish GAD diagnosis, because anxiety symptoms are usually not the presenting complaints; therefore a structured clinical interview should be the first step to establish an accurate diagnosis, aided by the Diagnostic and Statistical Manual of Mental Disorders. The need for treatment is influenced by disease severity, impact of symptoms and the presence of comorbid disorders. The choice of a particular treatment should be influenced by patients characteristics, preferences and local availability options. Psychological therapy, based on cognitive behavior therapy and the first-line pharmacologic agents, selective serotonin reuptake inhibitors, are effective treatments. However, evidence suggests that the effects of psychological therapies may be more durable. It should be emphasized that treatment response is not immediate and that prolonged courses are needed to maintain results. Psychiatric referral should be considered in patients who fail to demonstrate improvement or if serious comorbid problems, such suicidal ideation or substance abuse.

CONCLUSION: The personal and societal burden associated with GAD is considerable, but many people who might benefit from treatment are not recognized or treated. The therapeutic approach should be based on educational, psychological or pharmacological interventions, according individual factors.

Keywords: “Generalized Anxiety Disorder”, “Treatment”, “Management”, “Primary Care”

Table 1: Diagnostic Approach of GAD

Diagnostic approach: Key Points

Diagnostic approach: Key Points

Symptoms identification of anxiety

Excessive anxiety, worry, restlessness and stress and difficult to control, associated with functional impairment

Symptoms characterization	Intensity, frequency, duration, timing, development, relief or worsening factors
Somatic symptoms	Autonomic hyperactivity (palpitations, tachypnea, sweating), headache, dizziness, "light-headedness", muscle tension, tiredness, difficulty concentrating, sleep disturbances
Identification of psychosocial factors triggering anxiety	Life changes, separation, bereavement, recent or past trauma
Psychosocial exploration	Beliefs, expectations, content of thought, affection
Medical and psychiatric pathology, alcohol and drugs consumption	Personal history, physical examination and laboratory study, if appropriate

Table 2: Risk factors for GAD

Risk factors for GAD

Personal and familiar history of mood or anxiety disorders

Woman

Low socio-educational level

Presence of chronic medical illnesses

Susceptible pre morbid personality

Adverse life events (divorce, unemployment, serious illness, bereavement, adverse parenting in childhood)

Table 3: Differential Diagnosis of GAD

Differential Diagnosis	Differential Diagnosis
Non pathological anxiety	Less pervasive concerns, without psychosocial functioning impairment
Substances consumption or withdrawal	Sympathomimetics, xanthine derivatives, steroids, alcohol, illicit drugs, antidepressants, antipsychotics, hypnotics / sedatives, anticholinergics
Medical diseases	Neurological, cardiopulmonar or endocrine diseases
Psychiatric illness	Specific and social phobia, adjustment disorder, obsessive-compulsive disorder, depressive syndrome, psychotic disorder, posttraumatic stress and bipolarity

⁵Department of Internal Medicine, Gulhane Military Medical Faculty, Ankara, Turkey

AIM: Age seems to be one of the important factors in psychiatric disorders. This research was done to determine the relationship between age and anxiety levels of patients with generalized anxiety disorder (GAD).

METHOD: Between 2009 to 2012, 73 patients enrolled in this study. Age and Beck Anxiety Scale score were (BASS) compared. SPSS 20 for Mac used to analyze the data.

RESULTS: There were 61 (83.6%) female and 12 (16.4%) male. Older patients had lower BASS than younger (p=0.009).

CONCLUSIONS: BASS seems to be lower in elderly patients.

Keywords: age, anxiety level, relationship

Madelung's disease VS Thyroid disease: report of a clinical case

Marta Lopes¹, David Rodrigues¹, Nídia Nunes¹, Susana Grilo Lourenço¹, Teresa Pereira Leite²

¹USF Planície, ARS Alentejo, Évora, Portugal

²USF Alcaides, ARS Alentejo, Montemor-O-Novo, Portugal

BACKGROUND & AIM: Madelung's disease, or multiple symmetric lipomatosis, is a rare disease, characterized by accumulation of unencapsulated fat, generally located symmetrically around the neck and shoulders. It is commonest in countries bordering the Mediterranean. Approximately 300 cases have been published. Benign symmetrical lipomatosis of the neck has to be differentiated from goiter, obesity or lymphatic tumor. This study describes the case of a patient with Madelung's disease whose diagnosis is often confused with thyroid pathology.

CASE DESCRIPTION: Patient male, 72 years old, Caucasian, inserted into nuclear family in the phase VIII of Duvall Cycle. Previous history of hypertension, dyslipidaemia, hyperuricemia, cerebral vascular disease and chronic alcoholism. In 2002 the patient was hospitalized for ischemic stroke, and it was detected a bilateral neck swelling compatible with enlarged thyroid. The patient had laboratory analysis, ultrasound and thyroid gammagraphy which were normal.

After hospital discharge, the patient appealed for the first time to your family doctor's consultation. The family doctor's realized bilateral neck swelling and returned to run tests and thyroid ultrasound that revealed no changes in the gland. However, the ultrasound showed a heterogeneous thickening of soft tissues prior to the thyroid. The patient had cervical computed tomography identified diffuse hypertrophy of adipose tissue in the neck, consistent with Madelung's disease.

In 2010 the patient it was hospitalized again. At the increase in cervical patient volume, the doctors returned consider the diagnosis of substernal goiter. The patient repeated analyzes and thyroid ultrasound, which again revealed no changes. The patient underwent a second cervical computed tomography that confirmed the

diagnosis of Madelung's disease.

CONCLUSIONS: Although the Madelung's disease can be diagnosed right after detailed clinical examination, this study pointed out possible diagnostic mistakes when a physician in a differentiation of symmetrical neck swellings doesn't consider the possibility of diagnosing a Madelung's disease.

Evaluation of Health Related Quality of Life in Obese Individuals

Fatma Kocaman¹, Berrin Telatar², Albena Gayef³, Can Öner²

¹Istanbul Bölge Hospital, Nutrition and Dietetics Specialist, Istanbul, Turkey

²Istanbul Bilim University, School of Medicine, Department of Family Medicine, Istanbul, Turkey

³Istanbul Bilim University, School of Medicine, Department of Medical Education and Informatics, Istanbul, Turkey

Background & AIM: Obesity increases morbidity, mortality and reduces the quality of life. The aim of this study is to investigate the effect of obesity on health-related quality levels of life.

METHOD: The study was conducted with 150 patients and their relatives admitted to the clinic within 2013. The ethics committee approval was taken. Individuals over 18 years of age were enrolled. Sociodemographic questionnaire form, health-related quality of life scale (SF-36) were used for data collection. Body Mass Index (BMI) was calculated. Questionnaires were administered through face to face interviews. The obese, overweight and normal individuals were compared by SF-36 subgroup mean scores. NCS 2007 was used for statistical analysis.

RESULTS: In the study (23.3%) individuals were obese, (35%) were overweight, (46.7%) were normal weight. Obesity was higher in women, in married and non-working individuals. ($p < 0,05$). 82.8% of obese individuals were dissatisfied with their weight ($p = 0,0001$). Familial, environmental and social pressure were significantly higher in obese ($p = 0,002$, $p = 0,042$). Individuals in each of the three groups want to lose weight primarily for health reasons and appearance at a lesser degree. Weakening demand for health reasons was highly significant in the obese group. Compared to sub-groups of the SF-36 scale, significant difference was found in physical function, general health and physical function components. Obese group's physical function means were significantly lower compared to the other two groups. Increasing weight had no effect on the mental dimension ($p > 0.05$).

CONCLUSIONS: Obese individuals are aware of the negative impacts of this situation. Psychological problems may arise as a result of prolonged obesity. Primary health care should be able to play more active role in obesity; presence of nutritionist, social worker and psychologist at primary healthcare institutions will provide a more holistic approach.

P-0138

Prevalence of Peripheral Arterial Disease in Patients Who Require Home Care

Halis Yılmaz, Çiğdem Apaydın Kaya, Seda Arslan Özkul, Pemra Ünalın
Marmara University

Background & AIM: Most of the patients who need home care services are in high risk groups in terms of peripheral arterial disease (PAD). But, PAD may be asymptomatic in these patients due to inactivity. Determination of PAD in home care patients, may decrease ischemic events and risk of death. The aim of this study is to identify the prevalence of PAD and related factors in patients who are cared at home.

METHOD: This study is a cross-sectional study. The study was carried out among home care patients followed by Home Care Unit of Marmara University Hospital between June-December 2014. Two hundred eighty five patients (99 M, 186 F) who were older than 40 years old were included in the study. Ankle-brachial index (ABI) was assessed with a hand-held Doppler device and PAD was defined as ABI>0.9. Socio-demographic features, medical history and physical examination findings were recorded. Data were analyzed in terms of prevalence of PAD age and gender relation and other risk factors.

RESULTS: The mean age of the patients was 76±1.17 (42-100). The PAD prevalence of home care patients were 16.8% (12.4% for female, 25.3% for male). In the univariate analysis, male gender, skin fold thickness, diabetes mellitus, hypertension, CAD and ever smoking were associated with PAD (p<0.005). In multivariate analysis, ever smoking (OR:5.63), hypertension (OR:2.44) and high skinfold thickness (OR:1.11). were the risk factors for PAD.

CONCLUSIONS: This study is the first study that determined the prevalence of PAD and related risk factors in patients who require home care. Our study showed that the prevalence of PAD is high in home care patients. The patients who require home care, may be asymptomatic for PAD depending on inactivity. So, ABI measurement is very important for these patients.

ETHICCAR: Evaluation of therapeutic education for patient with high cardiovascular risk in primary care in France

Mélanie Afonso, Jean Philippe Joseph, Jean Louis Demeaux, Marie Laure Marty, Bernard Gay
 General Practice Department, Bordeaux University, Bordeaux, France

Background and AIM: Therapeutic Patient Education (TPE) takes a larger place in the management of chronic diseases, particularly in primary health care. Educative interventions can have a positive impact on the patient outcomes in cardiovascular diseases, who are one of the leading causes of death in France, especially for untimely mortality. The research question is: what is the effect of TPE on risk score in patient with high cardiovascular risk? The aim is to analyse the efficacy of TPE on risk score and to compare individual or collective interventions. METHOD: Cluster-randomized controlled trial, comparing the effectiveness of individual or collective methods of TPE, vs usual follow-up (control group). Inclusion criteria: patients with at least 3 cardiovascular risk factors. Primary endpoint: cardiovascular risk score calculated using the Framingham and SCORE equations. Intention-to-treat analysis of risk evolution.

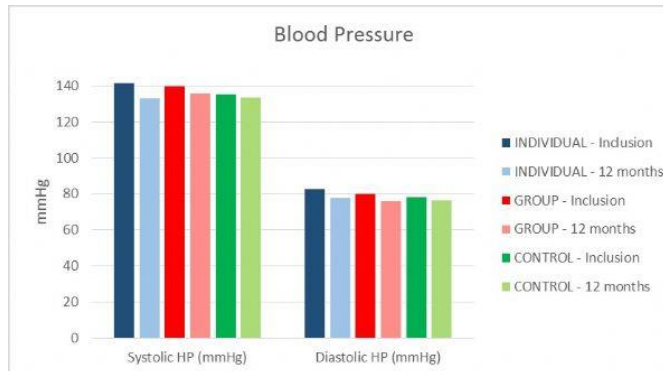

RESULTS: Of the 219 patients included (81 in the collective group, 78 in the individual group, 60 in the control group) from 72 GPs, 153 were followed in one year. Patient's characteristics were not significantly different in the 3 groups. The comparison of the risk score from the inclusion to one year in each of the 3 groups highlighted a significant difference in the individual group according to Framingham ($p=0.009$) and SCORE ($p<0.001$), and a significant difference in the collective group according to SCORE ($p=0.03$). The risk score between inclusion and 12-month declined overall by 1.7% according to Framingham and 0.6% according to SCORE, but this decrease appeared not significant in the 3 groups. There was no significant difference between the 3 groups in the percentage of patients with a risk score improved in 12 months.

CONCLUSIONS: At 12 months, despite a significant difference in intervention groups, the ETHICCAR study cannot highlight a possible effect of TPE in individual and collective groups vs control group.

Behçet disease – a case

Ana Patrícia Rodrigues Carvalho Rosa, Eliseo Manuel Álvarez Martínez, Carlos Filipe Martins Dos Santos, Andreia Filipa Lopes Fernandes

Family Health Care Unit Alcaides Faria, Barcelos, Portugal

Behçet's disease is a multisystemic disorder characterized by a generalized vasculitis with potential involvement of the blood vessels of all sizes, arterial and venous. There are no pathognomonic laboratory tests for this disease based on clinical diagnosis.

The authors describe a clinic case of a 43 years old woman, caucasian race, without a relevant clinical history. On September 2011 began recurrent episodes of maculo-papular skin lesions with some pustules and vesicles, variable location with achievement of upper and lower members. On suspicion of impetiginized allergic dermatitis was treated with corticosteroids and topical antibiotics with partial response and limited in time. Extended analytical study was made with nonspecific results. Skin biopsy was performed and result was consistent with Sweet's syndrome, so was made treatment with oral prednisone and dapsone. From September 2012 there is emergence of multiple episodes of recurrent oral and tongue aphthous ulcers, red eye and altered bowel habits. Endoscopic study performed with no significant results. There wasn't complete clinical remission despite established therapy. On May 2013, after the appearance of a massive vulvar ulceration, was established the diagnosis of Behçet's disease and started multidisciplinary hospital monitoring.

Initially treated with prednisolone and cyclophosphamide, without good response, had multiple hospital admissions for neurologic involvement of Behçet's disease. Currently in remission with combination therapy with prednisolone, azathioprine and infliximab. Behçet's disease is characterized clinically by recurrent presence of oral aphthae and other systemic manifestations including genital ulcers, eye disease, skin lesions, gastrointestinal disorders, neurological disease, vascular disease and arthritis; being the most frequent symptoms and earlier oral aphthae, skin lesions and urogenital ulcers. With this clinical case the authors want to emphasize the importance of the family doctor in the timely detection of systemic disorders with manifestations initially mucocutaneous.

COPD Screening in smokers and former smokers in primary care

Nuria Sanchez Ruano¹, Amparo Hervas¹, Cristina Colungo¹, Nora Selvi¹, Silvia Alvarez², Xavier Flor²

¹CAP Comte Borrell, CAPSBE, Barcelona, Spain.

²CAP Chafarinas, Barcelona, Spain.

Justification

Chronic obstructive pulmonary disease (COPD) is the fourth leading cause of death in the world. Underdiagnosis of COPD seems to be common. Early diagnosis through case finding will allow for early actions, to influence smoking cessation and can achieve a reduction in the burden of COPD symptoms and reduced disease impact. Spirometry is required to make the diagnosis in the clinical context. The role of primary care is very important in the detection of patients with COPD. Recently designed several portable electronic devices that allow obtaining quickly FEV1, FEV6 and FEV1/FEV6 ratio, and replaces FVC (patient's ability to exhale all the air), for only the patient is able to exhale in 6 seconds. These devices are useful for screening for COPD in primary care and the ratio FEV1/FEV6 has a good correlation with the ratio FEV1/FVC. This "office spirometry" is validated for the detection of airway obstruction. They are an excellent screening tool for obstructive diseases. If results are normal COPD is discarded. If the results are altered we perform spirometry to confirm the diagnosis.

Content

We will screen all patients at risk, smokers or former smokers over 40 years with cumulative dose >10 pack-year in consultations at the center of the urban primary care. A screening test will be done with the portable device(COPD-6). If the result is the FEV1/FV6(COPD-6)<0.70 or FEV1%(COPD-6)<80% rate will perform a chest x-ray and standard spirometry to confirm or rule COPD. The following variables will be evaluated: gender, age, smoker or former smoker, cumulative dose pack-year, asymptomatic or symptoms: cough, dyspnea (mMRC), mucus; Portable spirometry RESULTS: FEV1(COPD-6), FEV6(COPD-6) and FEV1/FEV6(COPD-6) and pulmonary age; Results of conventional spirometry FEV1, FVC, FEV1/FVC post-bronchodilator, and finally new COPD diagnosis, GOLD classification and patients who quit smoking after our intervention.

Amyotrofik Lateral Skleroz (ALS) ALS patients in Marmara University Training and Research Hospital

Seyhan Hidirođlu, Tunç Laçın, Int.dr. Safa Tuncar, Int.dr. Beray Karademir, Int.dr. Ufuk Birim Öncü Öncü, Int.dr. Aykan Baş Baş, Int.dr. Mehmet Solmaz Solmaz, Int.dr. Levent Ođuzhan Demire Demirel, Melda Karavuş
Marmara Üniversitesi Tıp Fakóltesi Halk sađlığı

PURPOSE: To investigate environmental, occupational and heavy metal exposure in ALS patients in Marmara University Training and Research Hospital.

METHOD: Questionnaires, that includes 21 personal information and multiple choice questions, are administered by telephone to ALS patients in Marmara University Training and Research Hospital. The data was evaluated using the SPSS 16.0 program.

FINDINGS: To our study 30 diagnosed ALS patients and 70 people without ALS has participated.

%61 percent of 100 people in our research were female, %39 percent were male. %57 percent of the ALS patient group were female, %43 percent were male. %20 percent of the participants were college graduates, %16 percent of them were high school graduates, %52 percent of them were primary school graduates, %6 percent of them were just literate, %6 percent of them were illiterate. In our study to the question about the previous history of accident-trauma %86 percent answered "no", %14 percent answered "yes". In the ALS patient group this question was answered % 70 "no" and %30 as "yes". We found meaningful relation to this question however regarding the other questions we couldn't find a meaningful relation between the patient and the control group. There has been no meaningful relation in between the patient and the control group about the usage of sea products, tuna fish, oyster, salmon. There was no meaningful difference between the participants previous living areas and their occupations as well.

RESULTS: According to the data we acquired, there has been no meaningful result between the control and the patient groups. Relatively most important meaningful result we had was the accident trauma history in the ALS patients. In order to learn more about the disease more studies are required.

Hypertension (HT) and Thiol/Disulphide Homeostasis

Basri Furkan Dađciođlu¹, İrep Karataş Eray², Tuncer Kılıç¹, Ahmet Keskin¹, Aylin Baydar Artantaş², Yusuf Üstü¹, Mehmet Uđurlu¹

¹Department of Family Medicine, Yıldırım Beyazıt University, Faculty of Medicine, Ankara, Turkey

²Family Medicine Clinic, Atatürk Training And Research Hospital, Ankara, Turkey

Background/AIMS: Thiol / disulphide homeostasis has a critical role in cellular events such as antioxidant protection and apoptosis. There is increasing evidence that deterioration in this balance plays role in the pathogenesis of various diseases including Hypertension. In this study, we aimed to investigate the relationship between HT and thiol/disulphide homeostasis which is a new indicator for the oxidative stress.

METHODS: Thiol / disulphide homeostasis parameters were studied in the blood samples of 51 patients with HT and 60 patients in the control group, who were 18 years or over and admitted to outpatient clinic of our hospital between December 2014 and March 2015. Subjects were selected from 574 patients according to exclusion criteria including history of chronic disease, smoking, alcohol consumption and malignancy. Venous blood samples were obtained from patients and centrifuged for 15 minutes at 3600 rpm to obtain plasma. After that, native thiol, disulphide, total thiol, index 1 (disulphide/native thiol), index 2 (disulphide/total thiol) and index 3 (native thiol/total thiol) levels were measured by an automated colorimetric analyzer. Statistical analyzes were performed on 111 patient who were included to the study. All statistical analyzes were performed with IBMSPSS Statistics (V.16) computer program. $P < 0,05$ was accepted as statistically significant.

RESULTS: Native thiol and total thiol levels of patients with HT were significantly lower than the control group [($p < 0,01$; $Z: -3,60$) and ($p < 0,01$; $Z: -3,96$) respectively]. Disulphide, index 1 and index 3 levels tended to be lower on patient group too, whereas the difference was not significant. (Table 1)

CONCLUSION: These findings are the first results of our continuing study and we aim to finish the process with higher amounts of patient data in order to publish the final results. Further studies may reveal the clinical importance of dynamic thiol/disulphide homeostasis on many conditions like HT.

Keywords: Thiol Disulphide Homeostasis, Hypertension, Oxidative stress

Prognostic value of ambulatory blood pressure monitoring in patients at high cardiovascular risk: diabetes mellitus type 2

Daniel Rey Aldana¹, Sergio Cinza Sanjurjo², Enrique López Paz³, Álvaro Hermida Ameijeiras³, Gaila Calvo González³, Carlos Calvo gomez³

¹centro de salud de a estrada, pontevedra, sergas, spain

²centro de salud de porto do son, a coruña, sergas, spain

³unidad de hipertensión y riesgo cardiovascular, servicio de medicina interna, complejo hospitalario universitario de santiago de compostela, a coruña, sergas, spain

Introduction and Objectives. Ambulatory Blood Pressure Monitoring (ABPM) defines the circadian variation and is the method of BP measurement that best defines the cardiovascular (CV) risk. Patients with Diabetes Mellitus (DM), are characterized by alterations in the circadian rhythm of ambulatory BP. The objective was to analyze the prognostic value of ABPM in a cohort of diabetic patients after 10 years of follow up.

Material and Methods. Cohort study in a sample of 766 unselected patients diagnosed with DM and HT. In all cases, a clinical-biological and MAP-24h evaluation was performed using monitors SpaceLabs and individualizing all reports. The follow-up of patients was performed by reviewing medical records, recording the event type (peripheral-EAP artery disease, coronary heart disease-CC, congestive heart-IC-stroke or cerebral vascular accident) and the date thereof.

Results. Follow up of 715 patients (274 women) was completed. During follow-up study, 319 events were recorded. Clinical variables, the presence of previous cardiovascular disease and established diabetic nephropathy negatively influence the CV prognosis and increase the incidence of events. From the values of MAP, those with greater prognostic correlation were nocturnal BP and circadian profiles in which a decrease or loss of depth of ambulatory blood pressure, $p < 0.0001$ is objective. The Kaplan-Meier curve shows that the circadian rhythms riser and non dipper are those with less free time of events.

Conclusions. Nocturnal blood pressure and decrease or loss of depth PA objectified by MAP, along with the presence of previous cardiovascular disease (including impairment of renal function and / or microalbuminuria) are the parameters that are associated with a worse cardiovascular prognosis of diabetic hypertensive patients, confirming the importance of the prognostic value of ABPM, and early diagnosis and treatment of these patients.

Analysis of the temporal trend in poor control of anticoagulated patients in a cohort of primary care patients

Daniel Rey Aldana¹, Sergio Cinza Sanjurjo², Enrique Gestal Pereira², German Allut Vidal², Carmen Lires Rodríguez², Antonio Garcia Rechou², Beatriz Martínez Pérez²

¹centro de salud de a estrada, pontevedra, sergas, spain

²centro de salud de porto do son, a coruña, sergas, spain

Objective. Knowing the variables that influence the TRT, and especially the temporal trend in patients with insufficient TRT.

Material and methods. A longitudinal study from an unselected sample of all patients treated at a rural health care center over three years. Patients who received anticoagulation with antivitamin K for at least six months, for a non-valvular AF obtaining a final sample of 130 patients were selected.

Results. 53.1% were male, with a mean age of 77.0 ± 1.5 years. The prevalence of hypertension and DM was 90% and 33.8% respectively, and 11.5% and 14.9% had had heart failure or stroke. The average number of drugs consumed by patients was 7.6 ± 0.6 . The prevalence of inadequate control of TRT, calculated by Rosendaal, was 60.2% in 2011, 54.2% in 2010 and 43.4% in 2012. Analyzing the behavior of TRT in patients with insufficient control in the first quarter of follow-up, we observed that would remain low in the following years (69.7% vs 55%, $p = 0.0005$, in 2011), (71.9% vs 59.3%, $p = 0.0015$, in 2012) and (74.7% vs 60.0%, $p < 0.0005$, in 2013).

Conclusions. Our study shows that patients with poor INR control in the temporary exhibit no tendency to achieve the therapeutic goal, so we raised the need for early clinical decision making in patients anticoagulated given the prognostic implications of atrial fibrillation.

Evaluation of Obesity and Blood Pressure Status of Health Care Workers: A Cross Sectional Study

Elif Altunbaş Ates, Turan Set

Department of Family Medicine, Karadeniz Technical University, Trabzon, Turkey

Background&AIM: According to one of the core-competencies of family medicine discipline community oriented care, it is important to identify the population and health needs. In this study we try to identify blood pressure levels, obesity status of health care workers at our hospital.

METHOD: This cross-sectional study was carried out among 341 health care workers between January 2015 and February 2015 in Karadeniz Technical University Research Hospital. Under the umbrella of periodic health examination these workers attended to Family Medicine Clinic. We designed a questionnaire which includes demographic characteristics and measurement of blood pressure, weight, height, waist and hip circumference. The data obtained were analyzed.

RESULTS: Female and male participants rates were 55.4% and 44.6% respectively. The mean age of male was 31.6 ± 8.5 ; mean age of women was 25.9 ± 7.5 years ($p < 0.001$). The percentage of hypertensive people was 4.3% ($n=15$). The mean BMI was 24.4 ± 4.1 kg/m²; average BMI of men was 25.6 ± 3.7 , women's average BMI was 23.5 ± 4.2 kg / m² ($p < 0.001$). Ratio of underweight, normal, overweight, obese participants were 4.4% ($n=15$), 56.8 % ($n=192$), 29.3% ($n=99$) and 9.5 % ($n=32$) respectively. While 50.3% of men are overweight or obese, this rate for women was 29.5% ($p < 0.001$). While the percentage of waist/hip ratio greater than 0.85 in women was 32.60% ($n=60$), this percentage was 4% ($n=6$) in men for waist/hip ratio greater than 1.

DISCUSSION: Participant's prevalence of hypertension was low according to the output of the population in Turkey. This might be attributed to doing research in the young population. According to our results obese participant's rate was low if we compare with Turkish population. But overweight population was greater than Turkish data which are at risk for obesity. We need to prepare a structured program for our health care workers not being an obese.

Acute Stress Disorder - The beginning of an essential hypertension

Nuno Guerra, Joana Almeida, Marta Magalhães

Health Unity Camélias, Health Center Porto VII, Vila Nova de Gaia, Portugal

BACKGROUND: Stress, in its many different ways, can lead to a temporary blood pressure (BP) rise. Nevertheless, it is under discussion whether an acute stress situation can or not lead to a permanent blood pressure rise.

OBJECTIVE: The aim of this study is to report a case of essential hypertension in a young woman with no cardiovascular risk factors, detected after an acute stress situation.

Description: Female, 37 years old, belonging to a nuclear family in the I phase of Duvall Cycle, with a personal history of migraine without aura. During a period in which her father was under an induced coma due to hemorrhagic stroke, she visited her general practitioner (GP) presenting with insomnia, irritability, lack of concentration and fatigue. The physical examination showed a BP of 170/110mmg, so she initiated treatment with 5 mg alprazolam and self-measurement of blood pressure. On account of maintaining high blood pressure, she was medicated with Lisinopril 20 mg and secondary hypertension screening was carried out with no significant findings and a diagnosis of essential hypertension was assumed.

DISCUSSION: Although there is no scientific evidence that supports a relation between an acute stress situation and hypertension, some studies defend the hypothesis that an acute stress could lead to an excessive cardiovascular reactivity, due to autonomic neuro system stimulation, injuring the blood vessels and changing the blood pressure receptors.

One of the six core competences of family physicians is the Holistic Approach which uses a bio-psycho-social model, taking into account emotional and biological dimensions. This case report intends to raise awareness about biological alterations that can appear after an acute stress event.

Keywords: Hypertension, acute stress disorder

December 2013

Soap - Insomnia, irritability, lack of concentration and fatigue

sOap - BP: 170/110 mmHg with no other findings

soAp - High blood pressure, Anxiety

soaP - Alprazolam 0,5 mg/day + self-measurement of blood pressure

January 2014

Soap - Better from the anxiety symptoms. Maintain the high blood pressure

sOap - BP: 160/100 mmHg

soAp - Arterial Hypertension

soaP - Secondary hypertension screening (hemogram, cortisol, calcium, TSH, T4, urin exam, aldosterone, kidney ultrasonography, cerebral tomography, tyroid ultrasonography). Initiated lisinopril 20 mg

January 2014

The secondary hypertension screening showed no significant findings and a diagnosis of essential hypertension was assumed. The BP was controlled with lisinopril 20 mg.

P-0148**Factors affecting treatment compliance in iron deficiency anemia**

Süheyl Asma, Çiğdem Gereklioğlu, Aslı Korur

Başkent University, Department of Family Medicine, Adana, Türkiye

BACKGROUND: Treatment compliance is an important issue in long lasting treatments. We aimed to evaluate treatment compliance in patients who use peroral iron due to iron deficiency anemia.

MATERIAL-METHODS: A total of 120 patients aged between 18-53 years (30 ± 10.1) who were admitted to Family Medicine Clinic in March 2015 and who had the history of iron treatment due to iron deficiency anemia were included in the study.

RESULTS: Of the patients, 48% were detected not to use iron pills regularly or sufficiently. When the reasons were evaluated, 17% were found not to be informed adequately by their doctors, 10% discontinued the treatment as their symptoms relieved, 51% were found to develop gastrointestinal side effects and 25% of them were detected to discontinue the treatment due to this side effect, 13% were detected to forget to take the medication, 52% found to gain weight during the treatment and 23% of them reported that they discontinued the treatment due to this reason.

CONCLUSION: We may conclude that treatment compliance is poor in iron deficiency anemia. The most important factors seem as gastrointestinal side effects followed by weight gain. We believe that sufficient information may improve treatment compliance and further studies are required to investigate these factors in detail.

Keywords: iron treatment, compliance, primary care

P-0149**Self-esteem, Social Appearance Anxiety, Body Cathexis In Obese Individuals**

Niyazi Yilmaz, Mehtap Kartal

Department of Family Medicine, Dokuz Eylul University, Izmir, Turkey

Obesity is a medical situation that is easiest to recognize and hardest to treat. Its effect on mortality and morbidity is well-known, however studies on the psychosocial aspect of it increases. This study aims to put forth the relation between obesity and self-esteem, social appearance anxiety and body cathexis.

The study planned as a case-control included 18-65 years of age who have applied to 24th Family Health Center (FHC) in Konak, Izmir between April 2014 and December 2014 and completed with 361 people where 180 obese and 181 normal weight had similar gender ($p=0.564$), age ($p=0.508$). Permissions were taken from Ethical Committee of Dokuz Eylul University and Public Health Directorate of Izmir. A questionnaire prepared by the researcher in addition to the Rosenberg Self Esteem, Social Appearance Anxiety and Body Cathexis Scales applied to the participants face to face, and their weights and heights were recorded.

Compared to the control group obese had lower education level ($p=0.001$), lower income ($p=0.033$), having an obese mother ($p<0.001$) and father ($p<0.001$) more. Obese had more hypertension ($p<0.001$), diabetes ($p<0.001$), depression ($p<0.009$), higher quitting smoking rate ($p<0.001$) and exercising rate ($p<0.001$). The self esteem ($p<0.001$), social appearance anxiety ($p<0.001$), and body cathexis of the obese is ($p<0.001$) much lower than the control group.

Besides its well-known medical problems, obesity causes loss in psychosocial aspects. The feeling of guilt and stigmatization result in focusing on body and self perception in the obese. Thereby, in addition to their negative body and self perception they develop anxiety regarding their appearance. When evaluating their obese patients, family physicians should be aware of their psychosocial problems and should inform them to get support when needed.

Keywords: Obesity, self-esteem, social appearance anxiety, body cathexis

Usefulness of retinography by non-mydriatic camera in diabetic patients in a primary care center

Victor Lopez Marina¹, David Rodriguez Vargas¹, Rosa Alcolea Garcia², Teresa Rama Martinez³, Gregorio Pizarro Romero⁴, Dolors Costa Picañol², Maria Petra Perez Hervada²

¹Primary Care Center of Piera. Catalanian Health Institute. Barcelona. Spain.

²Primary Care Center of Besos. Catalanian Health Institute. Barcelona. Spain.

³Primary Care Center of Masnou-Alella. Catalanian Health Institute. Barcelona. Spain.

⁴Primary Care Center of Badalona 6-Llefià. Catalanian Health Institute. Barcelona. Spain.

- **Background and AIMS:** Diabetic retinopathy is a leading cause of blindness, appearing in 2% of patients with diabetes mellitus (DM) of less than 5 years of evolution and in 25% of those over 25 years. This study evaluates the usefulness of retinography by non-mydriatic camera (NMC) for the diagnosis of diabetic retinopathy and other visual disturbances suspected.
- **METHODS:** Design: a descriptive transversal study. Emplacement: an urban primary care center. Subjects: 614 patients referred in 2014 to review the ocular fundus by NMC. Variables: age, gender, diabetes type, treatment and outcomes of the NMC. Statistics: mean, standard deviation, percentages, Chi-square test for inferential statistics.
- **RESULTS:** Age: 66,3±14,1 years, 47% having an age of 61-80 years. Gender: 55% male and 45% female. Diabetes type: 3% DM-1, 91% DM-2 and 6% have not DM (hyperglycemia, secondary diabetes, etc). Treatment: 17% diet, 61% oral antidiabetics, 15% oral antidiabetic+insulin, 7% insulin. Outcomes of the NMC: 88% submitted to the prove and 12% not submitted. 68% with NMC normal, 32% pathological (7% non-proliferative retinopathy, 22% diminished visual acuity, 3% ocular high tension, 26,05% cataracts, 12,61% drusen, 5,6% proliferative retinopathy) (figure 1). Inferential statistics: 39,2% are men with normal NMC ($p < 0,0066$); 27,29% are men with oral antidiabetic agents ($p < 0,0001$); 33,05% are men and have normal visual acuity ($p < 0,0001$); 60% of patients diagnosed with DM in 2014 made NMC that year ($p < 0,0001$); 47,35% of diabetics which made retinography perform monitoring control in 24 months ($p < 0,0001$).
- **CONCLUSIONS:** Most are patients >60 years treated with oral antidiabetics. In 1/3 of cases were observed

various visual disturbances, which may coexist: 26,05% cataracts, 22% diminished visual acuity, 7% non-proliferative retinopathy and proliferative 5,6%, etc. The NMC performed in primary care is a good diagnostic tool of diabetic retinopathy and other visual disturbances suspected.

The Evaluation On The Quality Of Life In The Patients Receiving Home Care Service

Yeşim Cengiz Balyen, Tahsin Çelepkolu, P. Gamze Erten Bucaktepe, Vasfiye Demir, Yeşim Doğrusöz, Serap Y. Aslan, Ahmet Yılmaz, Murat Orak, Mehmet Üstündağ
Dicle University Faculty of Medicine, Family Medicine, Istanbul, Turkey

INTRODUCTION:

Home care service is a healthcare model in which in-home health support including psychosocial, physiological, and medical support as well as social service is supplied for the individuals who are disabled or old, or the ones who are present with chronic diseases or spend their post-treatment recovery, which is aimed to help the patient readapt to social life and reduce family caregiver burden.

AIM: The aim of this study was to assess the quality of life of the patients receiving home care service and to discuss what regulations could be devised for this system.

METHOD: The universe of our study included the patients registered at the Home Care Services in Diyarbakır. The study included a total of 151 patients using a short form-36 (Sf-36) quality of life questionnaire including socio-demographic form.

RESULTS: All the mean quality of life scores were significantly lower than the standardized mean scores for Turkish community. The raw vitality, scaled vitality and mental health scores were significantly higher in unmarried patients. The raw general health perception (RGHP) scores were significantly lower in the uneducated group. RGHP, raw mental health, scaled general health perception and scaled mental health scores were significantly lower in the group with low level of income. RGHP and raw vitality scores were significantly higher in the patients cared for by a first-degree relative.

Conclusion and Suggestions:

Home care service should not be perceived as a mere service which only provides medical support for the patients; rather, it should be viewed as a service aiming to improve the quality of life of the patients by taking into account the sociodemographic characteristics of the patients and their families with a special focus on their material and pecuniary assets and by achieving active participation of state-run institutions, civil societies, and foundations.

Introduction:

Home care service is a healthcare model in which in-home health support including psychosocial, physiological, and medical support as well as social service is supplied for the individuals who are disabled or old, or the ones who are present with chronic diseases or spend their post-treatment recovery, and to their family which is aimed to help the patient readapt to social life, prepare him/her for reintegration into society for a comfortable and powerful life, and reduce family caregiver burden.

Aim:

The aim of this study was to assess the quality of life of the patients receiving home care service and to discuss what regulations could be devised for this system.

Method:

The universe of our study included the patients registered at the Home Care Services subordinate to the Diyarbakir Provincial Health Directorate. The study included a total of 131 patients who were interviewed face-to-face in their homes using a short form-36 (SF-36) quality of life questionnaire including socio-demographic and cultural information between July 2013-2014. Data were analyzed using SPSS 20.0 (SPSS Inc., Chicago, IL, USA).

Results:

All the mean quality of life scores obtained in our study were significantly lower than the standardized mean scores for Turkish community (see Table). The evaluations of the quality of life scores based on the demographic characteristics of the patients were as follows:

Gender-based comparison revealed that the difference between the raw emotional role functioning scores for women and men were slightly significant ($p=0.045$). The comparison based on marital status indicated that the raw vitality, scaled vitality and mental health scores were significantly higher in unmarried patients compared to married patients ($p<0.001$, $p<0.001$, $p<0.002$, respectively). The raw physical functionality and raw physical role functioning scores were significantly higher in the group with high level of education compared to other two groups ($p<0.001$, $p<0.001$, respectively). The raw general health perception scores were significantly lower in the uneducated group ($p=0.010$). The raw general health perception and raw mental health scores were significantly lower in the group with low level of income ($p<0.006$, $p<0.010$, respectively). The raw general health perception and raw vitality scores were significantly higher in the patients cared for by a first-degree relative ($p<0.006$, $p<0.010$, respectively). The raw general health perception and scaled general health perception scores were significantly lower in the group with a monthly income of <1.000 compared to the group with a monthly income of 1.000-1.500 ($p<0.006$ for both) and the raw mental health and scaled mental health scores were significantly lower in the group with a monthly income of <1.000 compared to the group with a monthly income of 1-1.500 ($p<0.010$ for both).

Subscales	Mean±Standard Deviation		p
	Turkish community	Patients (95% Confidence interval)	
Physical functionality	86.6±25.2	10.46±0.20 (10.7-10.86)	<0.0001
Physical role functioning	89.5±29.6	4.03±0.03 (3.97-4.08)	<0.0001
Pain	86.1±20.6	4.50±0.09 (4.31-4.68)	<0.0001
General health perception	73.9±17.5	9.72±0.25 (9.22-10.22)	<0.0001
Vitality	67.0±13.8	8.46±0.32 (7.82-9.09)	<0.0001
Social functionality	94.8±14.2	2.83±0.08 (2.68-2.99)	<0.0001
Emotional role functioning	94.7±20.9	2.97±0.01 (2.95-3.00)	<0.0001
Mental health	73.5±11.6	13.86±0.45 (12.97-14.75)	<0.0001

CONCLUSION:

Home care service should not be perceived as a mere service which only provides medical support for the patient and improve their quality of life, rather, it should be viewed as a service aiming to improve the quality of life of the patients by taking into account the socio-demographic characteristics of the patients and their families with a special focus on their material and primary assets and by addressing their perception of various situations, civil society, and information. Accordingly, establishing a systematic and applicable approach with minimum cash support will not undermine the value of home care service but also will provide a thoughtful workflow for this system.

The Evaluation On The Quality Of Life In The Relative Caregivers Providing Home Care Service

Yeşim Cengiz Balyen, Tahsin Çelepkolu, P. Gamze Erten Bucaktepe, Vasfiye Demir, Yeşim Doğrusöz, Serap Y. Arslan, Ahmet Yılmaz, Murat Orak, Mehmet Üstündağ
 Dicle University Faculty of Medicine, Family Medicine, Istanbul, Turkey

INTRODUCTION: Home care service is a healthcare model in which in-home health support including psychosocial, physiological, and medical support as well as social service is supplied for the individuals who are disabled or old, or the ones who are present with chronic diseases or spend their post-treatment recovery, which is aimed to help the patient readapt to social life and reduce family caregiver burden.

AIM: The aim of this study was to assess the quality of life of the relative caregivers providing home care service and to discuss what regulations could be devised for this system.

METHOD: The universe of our study included the patients', who are registered at the Home Care Services subordinate to the Diyarbakır Provincial Health Directorate, relative caregivers. The study included a total of 153 caregivers using a short form-36 (Sf-36) quality of life questionnaire including socio-demographic and cultural information between July 1 and August 31, 2014.

RESULTS: All the mean quality of life scores obtained in our study were significantly lower than the standardized mean scores for Turkish community (see Table). Gender-based comparison revealed that the scaled pain scores were significantly lower in women compared to men ($p=0.039$). Both the raw and scaled physical functionality scores were significantly higher in the group with low level of income ($p=0.010$, $p=0.004$, respectively).

Conclusion and Suggestions: Home care service is not a service that can be overcome by the caregivers alone. Caregivers should be trained about the disease of their patient and also full-time nursing services should be provided for caregivers in order to prevent their work losses and help them with physical difficulties. Establishing a systematic and applicable approach with minimum fault tolerance will not only enhance the value of this service but also will provide a thoroughgoing workflow for this system

Introduction:
Home care service is a healthcare model in which in-home health support including psychosocial, physiological, and medical support as well as social service is supplied for the individuals who are disabled or old, or the ones who are present with chronic diseases or spend their post-treatment recovery, and to their family, which is aimed to help the patient readapt to social life, prepare him/her for reintegration into society for a comfortable and peaceful life, and reduce family caregiver burden.

Aim:
The aim of this study was to assess the quality of life of the relative caregivers providing home care service and to discuss what regulations could be devised for this system.

Method:
The universe of our study included the patients', who are registered at the Home Care Services subordinate to the Diyarbakır Provincial Health Directorate, relative caregivers. The study included a total of 153 caregivers who were interviewed face-to-face in their homes using a short form-36 (Sf-36) quality of life questionnaire including socio-demographic and cultural information between July 1 and August 31, 2014. Data were analyzed using SPSS 20.0 (SPSS Inc., Chicago, IL, USA).

Results:
All the mean quality of life scores obtained in our study were significantly lower than the standardized mean scores for Turkish community (see Table). Gender-based comparison revealed that the scaled pain scores were significantly lower in women compared to men ($p=0.039$). Both the raw and scaled physical functionality scores were significantly higher in the group with low level of income ($p=0.010$, $p=0.004$, respectively).

Quality of life and sleep disturbances in elderly symptomatic patients with stable Chronic Obstructive Pulmonary Disease

Apostolos Manolis¹, Eleni Leontidou¹, Evangelia Nena⁴, Grigorios Trypsianis², Theodoros Konstantinidis⁴, Pashalis Steiropoulos³

¹Health Center of Iasmos, Komotini, Greece

²Department of Laboratory of Medical Statistics, Democritus University, Alexandroupolis, Greece

³Department of Pneumology, Democritus University, Alexandroupolis, Greece

⁴Department of Laboratory of Hygiene and Environmental Protection, Democritus University, Alexandroupolis, Greece

BACKGROUND: Impairment of health-related quality of life (HRQoL) and sleep quality are common but underestimated in patients with Chronic Obstructive Pulmonary Disease (COPD). Purpose of the study was to assess HRQoL and sleep characteristics of COPD patients with severe dyspnea and poor disease control.

METHODS: Consecutive patients with stable COPD (n= 60) were included. Their score in the Medical Research Council Dyspnea Scale (MRC) was indicative of severe dyspnea (MRC \geq 2). Additionally, their scores in COPD Assessment Test (CAT) indicated poor COPD control (CAT score \geq 10). All included patients answered the following questionnaires: Athens Insomnia Scale (AIS; for insomnia), Epworth Sleepiness Scale (ESS; for daytime sleepiness), Pittsburg Sleep Quality Index (PSQI; for sleep quality) and WHO-5 Well-Being Index (for QoL).

RESULTS: Patients were all males, mean aged 74.4, overweight (mean BMI of 28.2 ± 2.7 kg/m²) with impaired respiratory function (FEV1 $40.8 \pm 13.5\%$ pred, FVC $57.4 \pm 14.3\%$ pred, FEV1/FVC $54.7 \pm 9\%$ pred). In 86.7% of patients (n=52) the WHO-5 questionnaire was indicative of poor quality of life. Overall, 83.3% of patients (n = 50) reported poor sleep quality (PSQI score $>$ 5). Insomnia (AIS score \geq 6) was reported by the vast majority (n = 56; 93.3%). On the contrary, daytime sleepiness (ESS score $>$ 10) was reported only by four patients (6.7%).

CONCLUSIONS: COPD patients with poor disease control, apart from the disease-related symptoms, also experience insomnia, poor sleep quality and impaired QoL. This should be always kept in mind of family physicians, in order to deliver best quality care to their patients

A case of Takayasu arteritis presenting with weight loss and elevated erythrocyte sedimentation rate

Süheyl Asma, Çiğdem Gereklioğlu, Aslı Korur

Başkent University, Department of Family Medicine, Adana, Türkiye

BACKGROUND: Takayasu arteritis known as pulseless disease is a granulomatous vasculitis characterized by massive intimal fibrosis and affecting large vessels. It is common among middle-aged women.

MATERIAL-METHOD: In this case report, a 24-year-old female patient who was admitted to Family Medicine Clinic due to fatigue, weight loss and elevated erythrocyte sedimentation rate (ESR) with unknown origin lasting for six month and diagnosed with Takayasu arteritis as pulse could not be detected in the left arm is presented. Her medical history was uneventful. The left radial and ulnar pulses could not be palpated on her physical examination.

RESULTS: She was referred to Interventional Radiology and MR angiography revealed normal arcus aorta and normal main vascular structures originating from arcus aorta, severe stenosis approximately 3 cm in the left axillary artery and also a mild stenosis in the proximal part of the right renal artery. Her blood tests were normal except ESR of 68 mm/h, C-reactive protein (CRP) of 101 mg/L. She had no additional radiologic abnormality. She was referred to Rheumatology Clinic and diagnosed with Takayasu arteritis, steroid+methotrexate treatment was started. Acute phase reactant levels were detected to regress and her clinical condition was seen to improve after immuno-suppressive treatment.

CONCLUSION: We may conclude that diagnosis should not be based on only laboratory findings but a careful and detailed physical examination is essential in primary care. Further tests should be planned according to the preliminary data.

The prevalence of metabolic syndrome in Hashimoto's thyroiditis patients and correlation with various parameters

Murat Atmaca, Zeynep Tuzcular Vural, Işık Gönenç, Refik Demirtunç
Haydarpaşa Numune Training And Research Hospital Family Medicine Department

Background & AIM: Hashimoto's thyroiditis is an autoimmune disease in which the immune system attacks the thyroid gland, causing primary hypothyroidism. In this study, we aimed to investigate the prevalence of metabolic syndrome in Hashimoto's thyroiditis patients and correlation with various parameters.

METHOD: In this cross-sectional study, 116 women with Hashimoto's thyroiditis, followed up in our outpatient clinic, constituted the material of our research. Examinations and laboratory tests included thyroid function tests, anti-TPO and anti-TG levels and thyroid nodule presence. ATP III criteria were used for diagnosing metabolic syndrome.

RESULTS: We found the prevalence of metabolic syndrome to be 37.9% in our study. Correlation with age, showed that metabolic syndrome increased with age. The BMI levels of 18-29 year olds were lower and the insulin levels of 30-39 year olds were higher compared to other age groups. In regard to insulin resistance, there were no statistically significant differences amongst different age groups. There was negative correlation with higher education levels and work status and the prevalence of metabolic syndrome. Thyroid nodule diameters were statistically significantly higher in women with metabolic syndrome. Although our results correlate with other studies showing higher risks of metabolic syndrome with presence of thyroid nodules, large scale studies and widespread research should be conducted for more definite results. Receiving thyroid replacement therapy, anti-TPO and anti-TG positivity was not related to metabolic syndrome, insulin resistance, or BMI measurements.

CONCLUSIONS: As a result we believe that the prevalence of metabolic syndrome was very high in our study group. Family medicine specialists and physicians working in primary care health services should be aware of the age-related increasing risk for metabolic syndrome and should advise their patients to make lifestyle changes whenever necessary.

Relation between severity of hyponatremia and comorbidity in elderly patients who develop hyponatremia

Nuket Bayram Kayar¹, Yusuf Kayar², Dede Sit³

¹Department of Family Medicine, Bagcilar Education and Traditional Hospital, Istanbul, Turkey

²Department of Internal Medicine, Bezmialem Vakif University, Istanbul, Turkey

³Department of Internal Medicine, Bagcilar Education and Traditional Hospital, Istanbul, Turkey

INTRODUCTION: Hyponatremia has a higher incidence among elderly individuals. There are few studies include uptodate information on the relationship between severity of hyponatremia and comorbidity. The aims of our study are that; comorbid conditions in elderly inpatients diagnosed with hyponatremia and the relationship between hyponatremia severity and comorbid conditions.

MATERIALS-METHOD: A total 978 patients aged 65 years and older admitted for inpatient care at our clinic over the past one year were considered for our study. 176 patients with serum sodium <135 mEq/L were included in the study. Sodium levels between 126 and 135 mEq/L were defined as mild, between 116 and 125 mEq/L as moderate and 115 mEq/L and below as severe hyponatremia. The concomitant hyponatremia and comorbid conditions, the relationships between severity of hyponatremia and comorbid conditions were studied.

RESULTS: 7.2 years (65–95 years). Hyponatremia was significantly higher among women (female/male: 109/67; 61.6% vs. 38.4%). 121 patients (68.7%) had mild, 41 (23.2%) had moderate and 14(7.9%) had severe hyponatremia. Ninety-two patients (52.2%) had diabetes mellitus, 130 (73.8%) had hypertension and 87(49.4%) had chronic renal failure. A significant relationship was found between hyponatremia severity and ischemic and congestive heart diseases, neurological disorders, psychiatric disorders and thyroid dysfunction. In addition moderate and severe hyponatremia increased with higher number of comorbidities.±Patients' mean age was 76.1

CONCLUSION: Comorbid conditions may cause hyponatremia through several mechanisms but hyponatremia severity may differ. Hospitalizations, morbidity, mortality rates and healthcare expenses due to hyponatremia can be reduced with regular care of geriatric patients.

Keywords: Hyponatremia; Geriatric patients; Comorbidity

The Factors That Influence Physical therapy Patients' Lower Back Pain

Edibe Pirincci¹, Ferit Kaya², Eyyup Demirpolat³

¹Firat University School of Medicine. Department of Public Health

²Public Health Institution

³Training and Research Hospital

BACKGROUND & AIM: This study analyzes the factors that influence the lower back pain of patients in the Physiotherapy Unit of an Education and Research Hospital.

METHOD: The study sample included 102 patients who came to the physiotherapy unit and voluntarily participated in the study. The data were collected using a 23-question survey form created by the authors based on a review of the relevant literature. The data were entered into the SPSS Program For comparisons, p values below 0.05 were deemed to be statistically significant.

RESULTS: The average age of the participants is 46.78±14.40. Of the participants 65.6% are female. By occupation, lower back pain is most common among housewives. Of the patients who suffer from lower back pain, 57.8% are overweight or obese. Of the patients who suffer from lower back pain 11 times or more a year, the percentage of smokers is 66.7%, while this rate is 35.7% among nonsmokers (p<0.05). The increase in lower back pain with body mass index is not statistically significant (p>0.05). Of those experiencing lower back pain, 73.5% stand on their feet for long periods of time, and 67.6% lift heavy loads. The frequency of lower back pain among patients who do not receive drug therapy is greater than that of patients who do (p<0.05). Of the patients, 69.6% have lower back pain in their family, and 29.4% of the family members with lower back pain are their mothers.

CONCLUSION: More than half of the patients who have this pain are overweight or obese. Patients with lower back pain also tend to have family members with lower back pain. Smoking increases the frequency of lower back

pain. If measures are taken to reduce risk factors, the frequency of lower back pain which hinders daily life activities can be reduced.

Amaurosi fugax: a wake-up call for General Practitioner

Camilla Bersani, Nelson Gentile

Department of Primary Care, Ausl Bologna, Italy

BACKGROUND and AIM: Symptomatic carotid disease is defined as focal neurologic symptoms, sudden in onset and referable to the appropriate carotid artery distribution, including transient ischemic attacks (like amaurosi fugax; differential diagnosis in Tab.1), or minor strokes. The aim of this case report is to underline the role of General Practitioner (GP) to educate and first evaluate his patients.

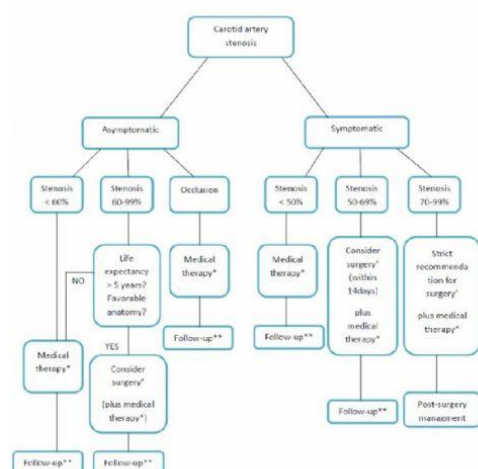

METHODS: M.S., male, 58 years old, overweight (BMI 28,6), smoker, pre-hypertension (140/86 mmHg), psoriasis with spotty dermatological manifestation, monocular since childhood for a trauma injury, hypercholesterolemia with hypertriglyceridemia in therapy only with omega-3-fatty-acid, not eligible to statins for high serum CPK baseline level. The patient was visiting his doctor for some right eye episodes of amaurosi fugax in march 2015. Physical examination: regular heart beats, blood pressure 156/86 mmHg, bilateral carotid bruit. GP added olmesartan and cardioaspirin, then sent MS to do carotid duplex ultrasound that evidenced bilateral stenosis (internal right 65-70 %). Afterwards the patient underwent right carotid endoarterectomy in last april 2015. Finally was started a therapy with amlodipina, doxazosina (plus enoxaparina for a week).

DISCUSSION: Stroke is the third cause of death in Italy and the first for disability. A common process leading to ischemic stroke is the complication of a carotid artery atherosclerotic plaque. Atherosclerosis is strictly connected with everyday life behavior. Primary prevention consist in stopping smoking, keeping fit, management of hypertension, diabete and/or dislipidemia. Carotid stenosis is suspected by carotid bruit at auscultation and detected with duplex ultrasound. Second level examinations are Computed Tomography Angiography and Magnetic Resonance Angiography. The treatment is medical therapy or surgery (endoarterectomy or stenting) according to stenosis percentage (Image 1).

CONCLUSIONS: Amaurosi fugax is a red flag for serious conditions. GP is the first to evaluate and manage correctly such pathologies to prevent morbidity and mortality.

Keywords: amaurosi fugax, carotid artery stenosis, stroke, prevention, general practitioner

Image 1. Flow-chart of carotid artery stenosis management

*Antiplatelet agents, anti hypertensive drugs, diabet and/or dyslipidemia treatment
 **Follow-up every 6-12 months
 *Endoarterectomy or stenting after careful evaluation of age of patient, co-morbidities, anesthesiologic and surgical risks

Table 1. Differential diagnosis of transient visual loss.

ETIOLOGY	TYPICAL DURATION	PATTERN OF VISUAL LOSS	ASSOCIATED SIGNS AND SYMPTOMS	MECHANISM
Monocular ischemia, carotid disease, other embolic source	1-10 minutes	Monocular, rapid onset, altitudinal onset	Hollenhorst plaque, hemispheric symptoms	Retinal embolism (usually)
Giant Cell arteritis	Variable	Usually monocular	Headache, neck pain, jaw claudication	Optic nerve ischemia
Papilledema	Seconds	Monocular blurring	Headache, diplopia	Elevated intracranial pressure
Idiopathic retinal vasospasm	5-60 minutes	Monocular positive or negative symptoms	Transient retinal arterial narrowing, headache	Vasospasm
Migraine	10-30 minutes	Usually binocular, positive symptoms with spread	Usually followed by migraine headache	Spreading cortical depression, possibly retinal vasospasm
Vertebrobasilar ischemia	1-10 minutes	Homonymous hemianopsia	Isolated or accompanied by other brainstem deficits	Embolic
Seizure: Ictal	3-5 minutes	Binocular, lateralized, positive phenomenon common	Altered consciousness, motor symptoms	Epileptic discharge
Post-ictal	20 minutes or more	Binocular visual field loss	Preceding ictus	Cortical inhibition

Use and adverse effects in oral anticoagulation:: Dicoumarol / NOACS

Pilar Aznar¹, José Ignacio Torrente¹, Roberto Gonzalez¹, Belen Gay¹, Silvia Castan², Silvia Torrente¹

¹Primary Health Center

²Public Health Technic

Atrial fibrillation (AF) is the most frequent arrhythmia in primary care, and it is associated with an increase in morbimortality due to the risk of embolism.

Our objectives were:

1. To learn about the type of anticoagulant used by our patients: Dicoumarol / NOACS (New oral anticoagulants), the causes for use, and the possible adverse effects.

2. To assess the level of INR (International normalized ratio) control of patients treated with dicoumarols.

We made a transversal, multicentre study on the use of anticoagulants in primary care.

In our study, we found an increase in the use of NOACS compared to our study made last year.

The level of INR control was deficient.

The increase in the number and duration of NOACS administrated was accompanied by the presence of some complications

Keywords: Atrial fibrillation, Dicoumarol, NOACS, Adverse effects

Use of anticoagulants

A 71-year-old Turkish female patient, a passive smoker from Turkey, admitted to our outpatient clinic for progressive shortness of breath and cough. She reported that her breathlessness and coughing episodes had become particularly severe in the preceding week. She has excessive daytime sleepiness and apnea. She stated that her husband died due to chronic obstructive pulmonary disease and she has 40 pack-years passive smoking history.

Her medical history revealed type 2 diabetes mellitus, systemic hypertension, arrhythmia, coronary artery disease, cerebrovascular disease. She had a history of farming. She hasn't stated any recent travel history. She has no family history of asthma or allergy.

On examination, she was in moderate respiratory distress and had decreased breath sounds and apparent cyanotic skin, +2 lower extremity edema.

Respiratory rate: 30

Heart rate: 88

Is Anorexia Nervosa or Celiac? A Case Report

Orkide Kutlu¹, Selma Pekgor², Samil Ecirli¹, Özlem Çakır¹, Yasemin Alagöz², Humeyra Yaka², Sule Erayman Demirbas¹, Abdulkadir Basturk¹

¹Department of Internal Medicine, Konya Training and Research Hospital

²Department of Family Medicine, Konya Training and Research Hospital

INTRODUCTION: Celiac disease is an autoimmune disease of the small intestine triggered by gluten containing food in patients with genetic predisposition. The immune response in the small bowel mucosa is characterized by inflammation, villous atrophy and crypt hyperplasia. The prevalence in the community is very high (1/100-300). It is usually diagnosed at 6 months to 2 years of age in children and 40-50 years of age in adults. The classic symptoms are chronic recurrent diarrhea, abdominal distension and weight loss. In adults, the most common finding is iron deficiency anemia. It may mimic irritable bowel syndrome. Herein, we report a patient diagnosed celiac disease while investigating with suspicion of anorexia nervosa.

CASE: A 26 year old female patient was admitted to the internal medicine department with complaints of decreased weight gain, nausea and vomiting after meals in the last 6 months. The patient was around 28 kg for many years. 3 months ago, psychiatric experts has began citalopram treatment and offer her admission to the hospital because of suspicion of anorexia nervosa. On physical examination, there was cachexia and cardiac 2/6 systolic murmur. Height 155cm and weight 23.5 kg. BMI was 9.9 kg/ m². In laboratory findings, glucose 66 mg/dL, total protein 4.3 g/dl (6.6-8.3), albumin 2.3 g/dl (3.5-5.2), proteinuria in 24-hour urine sample 2760 mg/dl. gastroesophageoduedonoskopi revealed grade B esophagitis, slow gastric motility movements and severely swollen/deformed duodenum (compatible with gluten enteropathy). The biopsies showed duodenitis. Antigliadin IgA (+), anti-endomysium IgA (++). ANA, ANCA were negative. C3,C4 were normal. The patient was treated with gluten-free diet.

CONCLUSION: It is not difficult to diagnose celiac disease, but diagnosis can be skipped when not suspected. In patients with anorexia nervosa, exclusion of organic pathology is extremely important. So mistakenly considered treatment resistant patients may be avoided.

Keywords: Celiac disease, anorexia nervosa, cachexia

Bisphosphonates-related adverse events: a survey of Lebanese physicians' knowledge, attitude and experience

Lana El Osta¹, Badi El Osta², Nazek Saadallah¹, Reine Tannous¹, Sara Lakiss¹, Maria El Gemayel¹, Nada El Osta³

¹Department of Public Health, School of Medicine, Saint-Joseph University, Beirut, Lebanon

²Georgia Regents University Cancer Center, Augusta, GA, USA

³Department of Prosthetic Dentistry, School of Dentistry, Saint-Joseph University, Beirut, Lebanon

BACKGROUND AND AIM: Bisphosphonates are widely used in the prevention and treatment of osteoporosis. They are also recommended to prevent skeletal complications and relieve bone pain induced by malignancies. However, these benefits are associated with multiple undesirable events, some of which may be serious and not previously recognized.

This study aims to assess the knowledge and attitude of Lebanese physicians regarding bisphosphonates-related complications.

METHODS: An observational cross-sectional survey was conducted at a major tertiary teaching hospital in Beirut city. Data were collected through an anonymous structured self-administered questionnaire distributed to physicians expected to regularly prescribe bisphosphonates (n=215). The questionnaire assessed participants' knowledge, fear and experience regarding bisphosphonates-reported side effects.

RESULTS: A total of 157 physicians completed the questionnaire (response rate: 73%): 77.7% and 75.2% considered that gastrointestinal intolerance and osteonecrosis of the jaw (ONJ) are linked to bisphosphonates, respectively. Conversely, the least recognised complications are ocular inflammation (7.6%) and severe musculoskeletal pain (37.6%). The association of bisphosphonates with oesophageal cancer, atrial fibrillation and hepatotoxicity was wrongly reported by 11.5%, 13.4% and 24.8% of respondents, respectively. The multivariate

analysis showed a significant association between the level of knowledge and physicians' specialty (-p-value=0.043), their gender (-p-value=0.044), whether or not they prescribe a bisphosphonate (-p-value=0.012), and the number of bisphosphonate prescriptions delivered per month (-p-value=0.012).

Physicians are mainly concerned about ONJ, atypical fractures and nephrotoxicity when prescribing a bisphosphonate. However, the complications frequently encountered in their practice are gastrointestinal intolerance (44.6%) and flu-like symptoms (26.7%).

CONCLUSIONS: Practitioners' awareness of bisphosphonates-related side effects can potentially lead to prevent the occurrence of more serious complications due to an earlier detection and management. Our study revealed that the adverse effect profile of these drugs is not well known by our physicians. Appropriate training strategies to increase their knowledge are needed.

Tophaceous chronic gout: A Case Report

Orkide Kutlu¹, Samil Ecirli¹, Vedat Gencer², Abdullah Sakin³, Şule Erayman Demirbas⁴, Humeyra Yaka⁴, Abdulkadir Basturk¹, Ahmet Yıldırım¹

¹Department of Internal Medicine, Konya Training and Research Hospital

²Department of Nephrology, Konya Training and Research Hospital

³Department of Oncology, Okmeydanı Training and Research Hospital

⁴Department of Family Medicine, Konya Training and Research Hospital

INTRODUCTION: Gout is more common in men at middle ages, and its incidence has reached 3%. After recurrent arthritis, chronic arthritis and tophaceous gout may develop. Allopurinol and uric acid lowering therapy has provided significant reduction in tophaceous gout. Herein, we report a patient with dense tophus deposits on the hands, olecranon bursa and first metatarsophalangeal joints as it is rarely encountered today.

CASE: A 71-year-old male was admitted to our outpatient clinic with complaints of masses on his extremities. He had been diagnosed gout 30 years ago. He has been taking colchicine 1.5 mg/day and allopurinol 150mg/day for last 1 year. There were significant tophus deposits on his hands, olecranon and first metatarsophalangeal joints (Figure). In laboratory findings

; Uric acid 3.8 mg/dL (2.6-6), sedimentation 26 mm/h (0-25), CRP 28.6 mg/l (0-5). CBC, urea, creatinine, albumin, ALT, CK levels were normal.

DISCUSSION: In patients with asymptomatic hyperuricemia without arthritis, renal stone or tophus formation, there is no need to start the long-term, expensive, and potentially toxic treatments. Colchicine, NSAIDs or corticosteroids provide dramatic improvements in the acute attacks. In periods between the acute attacks, the poor purine diet (meat products, alcohol, fructose corn syrup) getting plenty of fluids, to avoid treatments reducing uric acid excretion (thiazide/loop diuretics, low-dose aspirin, niacin, cyclosporine) and using colchicine is important to prevent new attacks. Uric acid lowering treatments (allopurinol, febuxostat) can be used in patients with 2/more acute arthritis attacks in a year, grade 2/above CRF or tophus deposits to decrease serum uric acid levels <6 mg/dL. Uricosuric agents (probenecid, urine, alkylating agents) or uricase (pegloticas A) also can be used. Allopurinol may cause life-threatening form of hypersensitivity (hepatitis, toxic epidermal necrolysis, vasculitis) in 2% of patients. Excision of the tophus may be performed in selected patients.

The association between hematologic parameters and disease activity in patients with ankylosing spondylitis

Ayşe Nur Topuz¹, Ipek Türk², Nafiz Bozdemir¹, Mustafa Topuz³

¹Department of Family Medicine, Çukurova University, Adana, Turkey

²Department of Rheumatology, Çukurova University, Adana, Turkey

³Department of Cardiology, Adana Numune Hastanesi, Adana, Turkey

AIM: Ankylosing spondylitis (AS) is a type of chronic inflammatory arthritis resulting in ankylosis of the spine and inflammation in the tendons. In this study, we aimed to investigate the usability of hematologic parameters to determine disease activity in patients with AS.

MATERIALS-METHODS: The study enrolled 65 patients diagnosed with AS. Patients were divided into two groups according to their Bath Ankylosing Spondylitis Disease Activity Index (BASDAI) scores. Thirty one (% 47) patients had BASDAI score ≥ 5 served as Group 1 and 34 (%53) patients had BASDAI score <5 served as Group 2. Patients' medications, demographic and laboratory findings were also recorded.

RESULTS: The demographic and clinical features of both groups were comparable. There was no significant differences between groups in terms of use of medications, duration of AS and presence of uveitis, enthesopathy and peripheral arthritis. The Erythrocyte Sedimentation Rate (ESR), C-reactive Protein (CRP) and Neutrophil/Lymphocyte Ratio (NLR) were significantly higher in patients of Group 1 compared to those in Group 2 (43.04 ± 31.4 vs 23.20 ± 17.20 $p=0.002$, 7.20 ± 1.74 vs 5.39 ± 1.43 $p=0.003$ and 3.14 ± 1.21 vs 2.33 ± 0.94 $p=0.004$, respectively) whereas the, Mean Platelet Volume (MPV) was significantly lower in Group 1 patients than in Group 2 patient (7.67 ± 1.62 vs 8.72 ± 2.30 $p=0.016$). BASDAI score was significantly negatively correlated with MPV ($r= -0.309$, $p=0.012$) and significantly positively correlated with ESR, CRP and NLR values ($r=0.427$, $p<0.001$, $r=0.328$, $p=0.008$ and $r=0.316$, $p=0.010$, respectively). These variables were entered into uni-and multivariate regression analysis and MPV was found a significant risk factor for predict the disease activity (OR 2.03 $p=0.012$).

CONCLUSION: As inflammation marker, MPV can predict disease activity in AS and could be used in primary care as an easy and inexpensive method.

GP Eye Health Network

Waqaar Shah¹, Annette Dinnall²

¹Royal College of General Practitioners

²UK Vision Strategy

Introduction

The Royal College of General Practitioners (RCGP) have selected eye health, with a focus on ageing and sight loss, as a clinical priority.

Dr Waqaar Shah, RCGP Clinical Champion for Eye Health, is working with the RCGP Clinical Innovation and Research Centre and UK Vision Strategy to provide clinical leadership for this programme of work.

Method: The aim of a GP Network is to bring together GPs and practice staff from across the UK to raise the profile of eye health within general practice and improve the quality of care for patients with sight loss by enabling them to:

- Access and share relevant research and examples of good practice
- Share innovative ways of managing patients with sight loss
- Develop care pathways with local eyecare providers including ophthalmologists and optometrists
- Collaborate with other practitioners in the health, social care and voluntary sectors at UK, national and regional levels.

Results

- The programme has established a UK wide GP Eye Health Network. It is the first network of its kind and currently has over 480 members from across the UK.
- A dedicated web page and resources have been set up for members on the UK Vision Strategy website
- A series of clinical factsheets have been developed for members by Dr Gilli Vafidis (an Ophthalmologist) and peer reviewed by a member of the Royal College of Ophthalmologists Professional Standards council, experts at the College of Optometrists, the Optical Confederation and British and Irish Orthoptic Society.

Conclusion: Early feedback on the usefulness of this network is very encouraging. Our aim is to increase membership and promote local champions in eye health, which would ultimately improve patient care.

- To join the free GP Network or for more information, <http://www.ukvisionstrategy.org.uk/GPnetwork>
- UK Vision Strategy website, <http://www.ukvisionstrategy.org.uk/clinicalpriority>
- Clinical Priority Programme: <http://www.ukvisionstrategy.org.uk/clinicalpriority>
- To contact Dr Waqaar Shah: email ukvisionstrategy@rnib.org.uk

Asthma would require a more individualized follow-up?

M Teresa Magdalena Carreres, Juan Carlos Montalvá Barra, Pilar Herrera Rodriguez, Rosa Albelda Vendrell
CENTRO SALUD CARCAIXENT - H DE LA RIBERA

Asthma is a chronic disease that causes inflammation and narrowing of recurrent pathology whose cause is variable and risk factors are a combination of genetic predisposition with environmental exposure to inhaled substances and particles (dust mites, pollens, molds, smoke snuff...)

According to the OMS estimates that there are currently 235 million asthma patients and is present in all countries.. Often asthma is not correctly diagnosed and properly treated, creating a substantial burden for patients and their families, and may limit the patient's activity throughout their lives.

A prospective study is proposed in health center with monitoring and smoking cessation in 25 asthmatic smokers (Richmond with medium-high motivation and test unit-high moderate Fragerström) of our consultations and assess whether individually controlled abandonment of snuff is achieved and a decrease in asthma attacks.

RESULTS

Of the 25 patients, 68% (17) they were male, with a mean age of 47.52 years and a follow-up at nurse and regular

physician while smoking cessation is achieved.

Three months, 50% of men achieved an improvement in dependency while women 30% reduction was achieved in 100% dependent (8 women).

The emergency number was 8 patients (3.2%) and symptom control 90% reduction was achieved with 2 drugs in 90% (salbutamol and ipratropium bromide)

CONCLUSIONS

The individual adjustment and better monitoring of our patients can achieve improvement of symptoms and a cost-effectiveness much higher compared to patients not controlled in our consultations primary.

Use of liraglutide to improve metabolic control in patients with diabetes type 2 treated with insulin

⁴Centro de Salud de Fuente de San Luis, Hospital Doctor Peset, Valencia, Spain; nowadays in Urgencias Hospital Doctor Peset

⁵Centro de Salud de Fuente de San Luis, Hospital Doctor Peset, Valencia, Spain

Diabetes Mellitus type 2 is a chronic and underdiagnosed disease in our country, with a high impact in the health system which treatment should be directed to the control of the comorbidities. GLP-1 receptor agonists is a group of drugs that induces loss of weight, improve blood pressure and dyslipemia in these patients by the incretin effect.

We present a case and a review of the literature on the role of liraglutide in the control of cardiovascular risk. It is a man, 69 years old, diagnosed of Diabetes Mellitus type 2 in 2003 treated with metformin. In 2008, due to a poor metabolic control, he was admitted, adding to the treatment insulin glargina and rapid insulin. During the remaining years, he continued with poor metabolic control so, in 2012, we decided to remove the rapid insulin and add liraglutide. Patient was followed throughout their cardiovascular risk. Currently, we can see a better blood pressure, cholesterol-LDL lowering and a loss of 6.3% of his initial BMI. The most important thing is that, before of the treatment, he has got HbA1c of 8.2 %, decreasing at 12 weeks of HbA1c to 7.7 % and 7.1 % in a year. Liraglutide Effect and Action in Diabetes (LEAD) program has demonstrated that liraglutide is effective and well tolerated in various stages of Diabetes type 2, as monotherapy or in combination with one or two oral agents. A recent meta-analyzes has evaluated the various randomized clinical trials comparing treatment with GLP-1 analogues associated with insulin, concluding that improved glycemic control, particularly postprandial with the combination is achieved, allowing a lower dose of insulin.

Finally, treatment with liraglutide has a lower rate of hypoglycemia than other treatments, being somewhat higher if it is associated with sulfonylureas, a fact not observed by associating with metformin or insulin.

Keywords: liraglutide, Diabetes, Cardiovascular Risk.

The Effect of Group Visits on Body Weight, Well-being, and Health Locus of Control in Overweight and Obese Women

Merthan Tunay¹, Hatice Kurdak¹, Sevgi Özcan¹, Çiğdem Özdemir², Funda Coşkun³, Özgür Günaşır²

¹Department of Family Medicine, University of Cukurova, Adana, Turkey.

²Department of Physiology, Division of Sports Physiology, University of Cukurova, Adana, Turkey

³School of Physical Education And Sports, University of Cukurova, Adana, Turkey

AIM: The aim of this study is to investigate the effect of group visits on weight loss, well-being, and health locus of control in overweight and obese women.

METHODS: Sixty volunteers meeting the inclusion criteria were enrolled in the study. Multidimensional Health Locus of Control and Short Form-36 scales were completed for each participant. Blood variables, resting metabolic rate, exercise stress test and arteriography measurements were performed. Diet and exercise programs were organized. The scales, blood analysis, exercise stress test and resting metabolism measurements were repeated for 30 participants who have completed the eight group visits in six months.

RESULTS: Participants mean body weights measured in the beginning of the study were significantly decreased 8,2% in the end (84.7±13.8 kg, 77.8±14.1 kg, p <0.001, respectively). Significant decreases were found in mean body mass index, waist-hip circumference and waist-height ratio (p<0.001 for each). While significant increase was found in HDL cholesterol values, WBC, TSH, ft4, Hgb, Plt, AST, ALT, heart rate and systolic-diastolic blood pressures were significantly decreased. In the end of the study, significant improvement was observed in physical functioning, bodily pain, general health, vitality, emotional role and mental health subscales (p=0.011, p=0.003, p=0.004, p=0.04, p=0.014, p=0.024, respectively). Significant improvements were found both in physical (p=0.002) and mental component (p=0.038) summary scales. Participants' Health Locus of Control scores did not changed significantly. The time spent on a patient during the group visits was found to be 2,5 to 2,8 times shorter than that of individual interviews.

CONCLUSION: Our results showed that significant weight loss and quality of life improvement may be achieved with group visits in overweight and obese women. Our results may motivate physicians to use group visits for their overweight and obese patients.

Impact of body size on risk factors and target organ damage

Ioannis A Kyriazis¹, Manolis S Kalistratos², Athanasios J Manolis²

¹1st Internal Medicine Department - Voula General Hospital, Athens, Greece

²Cardiology Department - Voula General Hospital, Athens, Greece

INTRODUCTION: Although increased body size represents an established risk factor for cardiovascular disease development, there is an ongoing research as to whether or not there is a threshold above of which the association of obesity and cardiovascular risk becomes less evident. This type of concern which is graphically represented by a J-type curve is also extended at the lower values of body size measures.

OBJECTIVE: To differentiate the sub-clinical impact of adiposity on risk factors, target organ damage, including cardiac adaptations, especially beyond hypertension.

METHODS: In this observational study with a cross-sectional design, 231 patients referred or self-referred to our outpatient institution were prospectively enrolled. In all patients, medical history and physical examination as well as routine biochemical exams, clinic and 24-h blood pressure (BP) evaluation and finally echocardiography was performed.

RESULTS: Patients enrolled were mainly females (51%) aged $49,81 \pm 10$ years. 34,8% of the patients were obese while 38% overweight. Body mass index (BMI) was highly related to office and 24-hours blood pressure levels, lipidemic and glucose profile, but not with central BP levels, pulse wave velocity (PWV) and renal function. More precisely, overweight, obese but also underweight patients had increased mean 24 hours systolic and diastolic BP levels in comparison to normal weight patients (127/76 mmHg, 126/75 mmHg, 129/74 mmHg vs 118/71 mmHg ($p < 0.001$), higher morning and evening 24 hours mean BP levels ($p < 0.001$), higher office diastolic BP levels ($p < 0.001$) without any significant difference in office systolic BP levels, central BP and PWV levels ($p = ns$). As expected, glucose as well as lipidemic profile was highly related to BMI since the higher the BMI the higher the levels of glucose, LDL and triglycerides ($p < 0.001$).

CONCLUSIONS: Obese overweight and underweight patients presents increased cardiovascular risk factors and seems that a J type curve is present as expected.

²Internal Medicine Department - KAT General Hospital, Athens Greece

INTRODUCTION: The primary role in weight loss plays a change in eating behavior and increasing physical activity.

OBJECTIVE: To examine and record the result of the effect of the change in eating behavior and exercise in obese patients.

MATERIAL-METHODS: We followed for 1 year 164 patients [Men: 46 Women: 118, mean age 56.2 years old, from our Hospital

Outpatient Obesity clinic. All were given hypo caloric diet (minus 700 cal / day) and exercise program (1/2 hour brisk walking a day).

RESULTS: Our intervention resulted in significant weight loss and less abdominal obesity (Table 1).

CONCLUSIONS: The problem of obesity is dramatically increasing and so becomes more imperative to change dietary behaviors and increase physical activity in general population.

Keywords: Obesity, Weight loss, Eating behavior, Exercise

Table 1

Initial BMI	36,9 (8,7)
Men/Women	44,7(11,6)/35(6,8)

INTRODUCTION: Raynaud's phenomenon (RP) is a three-phase (paleness/cyanosis/erythema) reaction often at the hand fingers, the ears and the nose tip which can be occur spontaneously or triggered by cold, physical and emotional stresses. If it is not associated with underlying vascular or connective tissue disease, it is defined as primary Raynaud's syndrome. RP is seen 3-4% in the general population often in women. Pathophysiologically, changes in number or effect of postsynaptic and presynaptic alpha and beta adrenergic receptors; up-regulation of the sympathetic nervous system; changes in the release of vasoactive substances such as prostaglandins, calcitonin-gene linked peptide, nitric oxide, endothelin and serotonin; changes in blood viscosity; abnormal serum proteins and hypomagnesemia can be responsible for RP. Primary Raynaud's syndrome variant may be associated with angina attacks and migraine-like symptoms. The prognosis is usually benign but digital gangrene or tissue loss is rarely encountered. Here we report a case of serious RP who treated with video-assisted thoracoscopic surgery (VATS).

CASE: A 20 year old male patient was admitted to hospital with complaints of considerable pain, brusing, swelling and parestesia of the hands continuing for last 2 months. He was a soldier. On physical examination, the fingers were swollen and cyanotic. System examination and laboratory tests were normal. He has not any rheumatic disease. He was a smoker. Sympathectomy was performed with VATS method. In control examination prominent decline was observed in his complaints.

CONCLUSION: Conservative preventive methods, medical and surgical treatment options are available for the treatment of Raynaud's phenomenon. Video assisted thoracoscopic surgery (VATS) sympathectomy is another alternative surgical method. In the treatment of Raynaud's disease, VATS sympatectomy may provide fast, safe, economical and effective treatment option. Keywords: Raynaud's phenomenon, VATS, Sympathectomy.

Closing the prevalence gap: identifying chronic obstructive pulmonary disease (COPD) in people with serious mental health issues

Nicola Joanna Higgins

Department of Primary Care and Population Health, University College London

BACKGROUND: 9-10% of people in the world may have COPD, but even in developed countries only a quarter are diagnosed. There is a strong association between mental and physical ill health. People with mental health issues are also more likely to smoke than the general population, so may be at greater risk of COPD. A family practice in England tested whether it was worthwhile to target people with serious mental health issues for COPD screening. **AIMS:** A large family practice in England tested inviting patients over 40 years old with serious mental health diagnoses and a history of smoking for spirometry screening. This may help to diagnose COPD earlier so smoking cessation, pulmonary rehabilitation, pharmacological therapy, and self-management can be promoted to improve people's quality of life.

METHOD: People with a serious mental health diagnosis or current anti-psychotic prescription were identified from electronic records. Those under the age of 40, those who had never smoked and those already diagnosed with COPD were excluded. People were invited by telephone and letter for screening spirometry with a doctor or practice nurse.

RESULTS: Fifty-four people were identified for spirometry. Thirty-two attended (59%) and of these three new cases of COPD were diagnosed. Two further people with abnormal spirometry were offered respiratory referral. Everyone screened was given smoking cessation advice and two people stopped smoking after spirometry. This means that 10% of people were diagnosed, received a referral or changed their behaviour as a result of this simple case finding initiative.

CONCLUSIONS: It is feasible and worthwhile to invite people at risk for spirometry in family practice. Targeting the vulnerable mental health patient group seems particularly worthwhile as their physical health needs are often overlooked. Opportunistic case finding is likely to be cost effective, estimated at £814 (\$1260) per quality adjusted life year.

Evaluation of The Results of Ambulatory Blood Pressure Monitoring In Outpatient Clinic of Family Practice

P Gamze Erten Bucaktepe, Vasfiye Demir, Ahmet Yılmaz, Hamza Aslanhan, Necmi Arslan, Veysel Kars
Family Medicine Department, Dicle University Medical Faculty, Diyarbakır, Turkey

Introduction

Hypertension is a chronic health problem that affected one third of people in the whole world and leads to a numerous systemic disorders if couldn't be managed properly. Furthermore it is one of the most seen diseases in the primary care. Since ambulatory blood pressure monitoring is very useful in detecting undiagnosed patients and evaluating the effectiveness of the treatment, we aimed to evaluate our Family Practice Outpatient Clinic's results of the ambulatory blood pressure monitoring.

Material and Method: The study included ambulatory blood pressure monitoring results of 64 patients who applied between 2011 and 2014 were evaluated retrospectively. The data including age, gender, height, weight, smoking, drug usage and chronic illness status as well as mean values of systolic and diastolic blood pressure (MSBP and MDBP), arterial pressure (MAP), pulse (MP), pulse pressure (MPP) and valid measurement numbers of the patients were recorded.

Results: Fifty six (87.5%) of 64 patients were women. Of the patients 8 (12.5%) were smokers, 43 (67.2%) were have chronic diseases and 31 (48.4%) were using antihypertensives. Mean values of the measurements were presented in the Table. There wasn't any statistical differences between gender, chronic disease, smoking status and MSBP, MDBP, MAP, MP, MPP values ($p > 0.05$). There was statistical significance between antihypertensive drug usage and MPP ($p = 0.013$). After ambulatory blood pressure monitoring, antihypertensive therapies of 13 (20.3%) patients changed, the dose increased or a new drug added. Antihypertensive treatment started to ten patients (15.6%) and 41 patients (64.1%) didn't have any intervention.

Conclusion: It was seen that the management procedure of hypertension carried out better with the ambulatory blood pressure monitoring. Moreover the patients were more satisfied with the application and their treatment compliance increased. It is concluded that ambulatory blood pressure monitoring would be useful and had to be expanded in primary care.

³ABS Santa Eulàlia Nord

Background & Aim: Analyze the optimization in diagnosis and treatment of patients with heart failure (HF).

METHOD: Retrospective study in urban primary care center. People with diagnosis of heart failure in computerized medical history between 2003-2015.

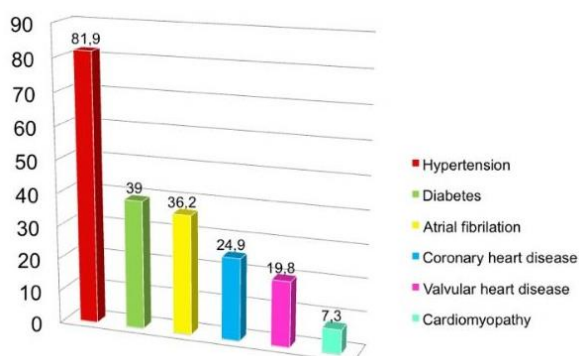

Those were the variables collected: Sex,age,duration,cardiologist visits,hospital admissions due to HF in 2014,cardiovascular risk factors,registration of clinical symptoms in medical history:dyspnea,fatigue,decreased mictorution,physical exam registration: cardiac auscultation (CA),pulmonary auscultation (PA) and lower limb edema,echocardiogram performed 3 months before or after the diagnosis and treatment: ACE inhibitors,ARBs,beta-blockers BB,AA aldosterone,diuretics.

RESULTS: 177 patients. 59.9% women,mean age 77.8 (SD 9.4),years evolution 3.44 (SD 3.13),cardiologist visits / year 0.94 (SD 1.26),hospital admissions 2014 0.5 (DE: 1). Cardiovascular risk factors: Hypertension 81,9%,Diabetes 39%,Coronary heart disease 24,9%, Valvular heart disease 19,8%,cardiomyopathy 7,3% y atrial fibrillation 36,2%. Anticoagulants 33.9% and antiplatelet 38.4%.Physical exam: pathological (29.4% CA, 46.9% PA, 47.5% lower limb edema),no data (29.4% AC, 22.6% AP, 26.6% lower limbs). An echocardiogram was done in: 53.7% (48.1 % Men 62% Women) p: 0.07. Treatment: 1- Systolic HF NYHA:I ACE inhibitor and BB 52.2%;II ACE inhibitor 11.9%, ACE inhibitors and BB 31.3%, ARB and BB 22.4%; III ACE inhibitor 15,2%, ACE inhibitor and BB 33,3%,ACE inhibitor and BB and AA 15.2%;IV ACE inhibitor and BB and AA 100%. 2- Diastolic IHF ACE inhibitor 17,2% ARBs 17,2% ACE inhibitor +BB 25,9% ARBs +BB 17,2.% 3- The diuretics 68.6% NYHA I 43.5%, II 72.5%, III 84.8%, IV 100% p: 0.015.

CONCLUSIONS: Patient symptoms and physical examination should be grater registered in medical history. Besides we should perform more echocardiograms for diagnostic confirmation. Treatment is suitable according to NYHA but should increased the use of aldosterone antagonist in Class III. Regarding the associated pathologies related with HF occurrence, we should detect, treat and control as soon as possible to prevent that occurrence.

A Case Admitted To Family Physicians With Diffuse Pain Complains: Psoriatic Arthritis

Ayşe Rana Platin¹, Fatma Keren², Duygu Kurtuluş³, Hatice Selcen Biçer²

¹Department of Family Medicine, Umraniye Training And Research Hospital, Istanbul, Turkey

²Department of Intenal Medicine, Umraniye Training And Research Hospital, Istanbul, Turkey

³Department of Physical Therapy, Umraniye Training And Research Hospital, Istanbul, Turkey

AIM: Psoriatic arthritis is a chronic inflammatory arthropathy characterized with peripheral joint, spine and enthesis involvement. Most of the cases are severe and progressive. The diseases affect patients' quality of life and leads functional limitation.

MATERIAL-METHOD: A forty-year-old Syrian man admitted to outpatient service with pain complains localized in knees, elbows, back and neck. Patients physical examination revealed psoriasis type skin lesions localized in elbow and knees. Also there was arthritis induced sensitivity in both knees. Patient's laboratory tests were in normal ranges; Erythrocyte sedimentation rate: 20mm/h, C-reactive protein: 3mg/dl, ANA: negative, Anti-CCP: negative and HLA b27: negative.

With existing laboratory findings and physical examination diagnosis differentiation for rheumatoid arthritis and ankylosing spondylitis has been made. Additionally patient's radiographic evaluation with x-ray was also normal. There was no joint space narrowing but there was widening in knee joints which was proving our diagnosis of arthritis.

In order to treat patient's skin lesions and arthritis we have started topical steroids, non-steroidal anti-inflammatory drug, methotrexate 10mg/week, folic acid and proton pump inhibitor.

RESULTS: Psoriatic arthritis generally diagnosed in divisions of rheumatology, physical therapy and rehabilitation or dermatology. This case was admitted to our clinic with diffuse pain complains. Patients diagnosed with anamnesis and physical examination. His treatment planned with physical therapy and rehabilitation specialists. We have started DMARDs like methotrexate, leflunomide. For unexpected loss of response we have consulted to rheumatology service to start biologic drugs basically the anti-TNFs. For the skin manifestation we have consulted to dermatology department. This patient is successfully diagnosed and followed in consultation with related specialties.

CONCLUSION: In this case we have diagnosed the patient through physical examination without radiography or laboratory parameters. As in most of the chronic diseases, the importance of anamnesis and correct physical examination has been reunderstood.

Post Polio Syndrome

Alfredo Quiles Raga, Enrique Almenar Cubells, Enriqueta Hernandez Hernandez, Diana Diaz Gil, Oscar Perez Quintana, Jose Espuig Aviño, Daniel Casiano Palacios Martorell, Juan Matamoros Hernandez, Amparo Ridaura Marti, Federico Vendrell Torres
Centro de Salud de Benifaio, Valencia, Spain

Introduction

Post-polio syndrome (PPS) refers to a clinical condition that can develop in patients who suffered polio in childhood, is a clinical diagnosis that is made by exclusion, and current diagnostic criteria set by the March of Dimes in 2010, include

- History of previous polio
- stabilization period after clinical symptoms of acute poliomyelitis least 15 years
- Establishment of acute or progressive new muscle deficit or abnormal fatigability (decreased endurance), with or without generalized fatigue, new muscle atrophy, or muscle or joint pain
- New symptoms should stay at least a year

-Reason for consultation:

Weakness, loss of strength and falls

Personal history

Polio, osteoporosis treated with raloxifene.

-Current disease:

Patient 52 years old, diagnosed with polio at age two, who used batons to wander English, referring for over a year, picture of weakness, loss of strength, fatigue and falls, but lately occasional arthralgia requires a more continuous use of NSAIDs (dexketoprofen) for control.

-Physical examination:

Flaccid paralysis and atrophy of the lower limbs

-Investigations:

Biochemistry and CBC, not objective liver, musculoskeletal disorders (CRP, FR), infectious or metabolic disorders (including iron and TSH profile)

-Diagnostic trial:

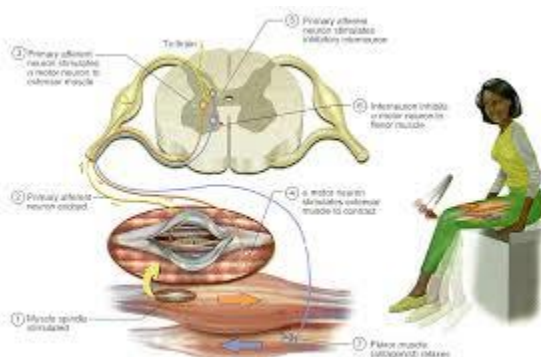

Post-polio syndrome (PPS)

Diagnosis of exclusion of other neurological processes, medical and orthopedic

There is no specific pharmacological treatment for PPS and approach must be multidisciplinary, including Family Doctor, Neurology, Psychologist and Social Worker

Keywords: Polio, Flaccid paralysis, Weakness

Respiratory disease consultation in Primary Care Setting: A three year experience

Rui Miguel Gigante Manso, Mafalda Cerqueira, Raul Marques Pereira, Cecilia Oliveira Abreu
USF Lethes, Centro de Saúde de Ponte de Lima, Unidade Local de Saúde do Alto Minho, Viana do Castelo, Portugal
Background

Chronic Obstructive Pulmonary Disease (COPD) presents a diagnostic and therapeutic challenge for primary health care, requiring an individualized and multidisciplinary approach in order to achieve an early diagnosis, appropriate monitoring and consequent reduction of exacerbations and decline in lung function. In Portugal prevalence is estimated in 5.3%, reaching 14.2% in adults 40 years or older.

Aim: The main aim of this study was to determine the prevalence of COPD in our Primary Health Care unit. Secondary objectives included: characterization of patients, classification according to Global Initiative for Chronic Obstructive Lung Disease (GOLD) criteria and treatment management.

Methods: We performed an observational, retrospective study. Since 2012 our health care unit implemented an integrated respiratory illness consultation (nurse and doctor). Individuals 40 years and older with history of smoking (10 years or more) were invited to attend this consultation. All collaborators received previous training regarding diagnostic criteria and treatment options.

All participants completed an assessment Test (CAT) at initial visit and were required to perform a spirometry. Patients were re-evaluated and classified using the 2013 Global Initiative for Chronic Obstructive Lung Disease (GOLD) criteria. Characterization and stratification of patients as well as treatment options were registered in a purposely formulated database.

Results: 273 patients were invited to attend the respiratory consultation. 201 patients attended (presence rate of 74%). The prevalence of COPD found in 2014 was 1 %. 82% presented recent spirometry and 86% undergoing inhaled corticosteroids and /or bronchodilation therapy.

Discussion: Despite the effort in implementing this particular consultation to identify COPD patients who were not previously diagnosed, the prevalence of COPD in our Primary care setting remains below our national numbers. It was however possible to increase the number of patients with updated spirometry update diagnosis and optimize therapeutic strategies.

Keywords: Chronic Obstructive Lung Disease, Primary Health Care, spirometry

Headache in Hyperlipidemia Patients

Funda Yıldırım Baş¹, Seden Demirci², Bahriye Arslan¹, Zeliha Salman³

¹Department of Family Medicine, Süleyman Demirel University, Isparta, Turkey

²Department of Neurology, Süleyman Demirel University, Isparta, Turkey

³Eğirdir Community Health Center, Isparta, Turkey

BACKGROUND: Headache is the most common complaint of the patients, who applied to general outpatient clinics. In recent years, association between metabolic syndrome, obesity, and primary headaches has attracted much attention. Our aim was to investigate the association between headache and hyperlipidemia.

METHODS: 92 participants having hyperlipidemia and 100 healthy controls were enrolled in this study. All participants were checked for their total cholesterol, HDL and LDL cholesterol, and triglyceride levels. The diagnosis of hyperlipidemia was made according to National Cholesterol Education Program Adult Treatment Panel III (NCEP ATP-III) criteria. We investigated the presence of headache, the duration, frequency of headache, the duration of headache attack, and the severity of headache. The diagnoses of tension type headache and migraine were defined based on International Classification of Headache Disorders-II criteria.

RESULTS: Mean age of the participants was 37 ± 13.8 years. Of all participants, 106 (%55.2) were females, 86 (%86) were males. Two groups were similar in terms of gender and years. In hyperlipidemia group, 30 (%32.6) patients had headache, in control group 16 (%16.0) had headache. This difference was statistically significant (p=0.06). 7 (%23.3) patients were migraine, 21 (%70.0) were tension type headache, 2 were (%6.7) mixed type headache in hyperlipidemia group. 3 (%18.8) were migraine, 12 (%75.0) were tension type headache, 1 (%6.2) mixed type headache in control group. There was no statistically significant difference between the groups according to headache type (p=0.9). The patients with hyperlipidemia had significantly higher VAS and duration of headache attack compared to the controls (p = 0.003, p = 0.04, respectively).

CONCLUSIONS: Our study suggests that headache may be frequent in hyperlipidemia patients. Therefore, clinicians should be aware of headache in hyperlipidemia patients.

Keywords: headache, hyperlipidemia, migraine

Prevalence of insomnia and associated factors in the general population of Thrace, North-Eastern Greece

Eleni Leontidou¹, Grigorios Trypsianis², Evangelia Nena⁴, Pashalis Steiropoulos³, Apostolos Manolis¹

¹Health Center of Iasmos, Komotini, Greece

²Department of Laboratory of Medical Statistics, Democritus University, Alexandroupolis, Greece

³Department of Pneumology, Democritus University, Alexandroupolis, Greece

⁴Department of Laboratory of Hygiene and Environmental Protection, Democritus University, Alexandroupolis, Greece

Background-AIM: Insomnia is an important public health challenge due to its high prevalence, estimated between 10-20% in the general population, and its subsequent impact on individuals and societies. Aim of this study was to assess the prevalence of insomnia as well as the association between insomnia symptoms and different socio-demographic characteristics, behaviors and health-related conditions.

METHODS: A population-based sample of 771 individuals aged 24 to 89 years (mean age, 58.16 ± 13.12 years; 43% women) was selected randomly from the area of Thrace, North-Eastern Greece, using a multiple-stage sampling method with stratification according to gender, age and residence. Socio-demographic data, sleep habits and morbidity were recorded. Insomnia was evaluated with Athens Insomnia Scale (AIS), an 8-item scale assessing: sleep induction, awakenings, final awaking, sleep duration, sleep quality, daytime wellbeing, daytime functioning capacity and daytime sleepiness. Additionally, the Epworth Sleepiness Scale for Excessive Daytime Sleepiness, the Stop-Bang Questionnaire and the Berlin Questionnaire for Obstructive Sleep Apnea risk were also used. Insomnia was defined when AIS score was ≥ 6.

Results. The prevalence of insomnia in the total sample was 18.1% (n=141); difficulty in maintaining sleep was the most frequent symptom (26.2%). Multivariate logistic regression analysis revealed that insomnia was independently associated with female gender (aOR=1.76, p=0.005), age >70 years (aOR=1.61, p=0.040), high Body Mass Index (aOR=2.91, p=0.005), presence of a chronic disease (aOR=1.55, p=0.043), snoring (aOR=1.61, p=0.020), midday napping (aOR=1.58, p=0.025) and divorced/widowed marital status (aOR=2.23, p=0.002). In particular, mental and respiratory disorders, as well as chronic pain were significantly more frequent in subjects with insomnia.

Conclusions. Insomnia prevalence in North-Eastern Greece is in line with previous European and international reports. Different socio-demographic and anthropometric characteristics and chronic health disorders predispose to the prevalence of insomnia.

Prevalence and risk factors of excessive daytime sleepiness in the general population of Thrace, North-Eastern Greece

Apostolos Manolis¹, Grigorios Trypsianis², Pashalis Steiropoulos³, Evangelia Nena⁴, Eleni Leontidou¹

¹Health Center of Iasmos, Komotini, Greece

²Department of Laboratory of Medical Statistics, Democritus University, Alexandroupolis, Greece

³Department of Pneumology, Democritus University, Alexandroupolis, Greece

⁴Department of Laboratory of Hygiene and Environmental Protection, Democritus University, Alexandroupolis, Greece

Background–AIM: Excessive daytime sleepiness (EDS) is a common condition worldwide affecting negatively individuals' quality of life, daytime activities and having impact on occupational and transport safety. Aim of this study was to assess the prevalence of EDS and to correlate it with different socio-demographic, anthropometric characteristics and health conditions.

METHODS: A population-based sample of 771 individuals, aged 24 to 89 years (mean age, 58.16 ± 13.12 years; 43% women), was selected randomly from the area of Thrace, Northern Greece, using a multiple-stage sampling method with stratification according to gender, age and residence. Socio-demographic data, sleep habits and comorbidities were recorded. EDS was assessed with the use of Epworth Sleepiness Scale (ESS), a self-rating scale on the likelihood of dozing in eight situations of everyday life. Additionally, the Stop-Bang Questionnaire and the Berlin Questionnaire for the assessment of Obstructive Sleep Apnea risk were answered by the participants. ESS ≥ 10 was used to define EDS.

Results. Prevalence of EDS was 8.2% (n=63); excessive sleepiness "Watching TV" (71.4%) and "Sitting and reading" (47.6%) were the most frequent symptoms. Multivariate logistic regression analysis revealed that sleepiness was independently associated with male gender (aOR=1.90, p=0.044), high Body Mass Index (aOR=1.83, p=0.050), snoring (aOR=4.32, p<0.001), midday napping (aOR=3.54, p<0.001), high Stop-Bang score (aOR=6.95, p=0.002), high Berlin Questionnaire score (aOR=2.04, p=0.042) and low (aOR=3.41, p=0.001) or high (aOR=2.30, p=0.034) education level compared to medium education level. Regarding chronic conditions, mental disorders, diabetes mellitus, arterial hypertension, allergic rhinitis, migraine, dementia, benign prostate hyperplasia and hypothyroidism were significantly more frequent in subjects with sleepiness.

Conclusions. A significant proportion of residents in the area of Thrace, NE Greece, reported excessive daytime sleepiness. Various associations with anthropometric and socio-demographic characteristics were revealed, as well as with the presence of numerous chronic conditions.

Patient-centered Approach To a New Onset Diabetes Patient: Case Report

Yasemin Kılıç Öztürk, Ayşegül Bayad, Yusuf Adnan Güçlü
Izmir Tepecik Training and Research Hospital, Izmir, Turkey

INTRODUCTION

Diabetes is a chronic metabolic disease that requires continuous medical care. Patient-centered approach is important during treatment of patients with diabetes medication and lifestyle changes. Patient-centered approach to a new onset diabetes patient will be presented.

CASE REPORT

46-year-old male patient was admitted to our clinic with general fatigue and nonspecific abdominal pain. He had a past history of smoking and alcohol abuse for 25 years. He quit smoking because of chronic cough, he'd inhaled the intense solvents because of working in the furniture-polishing industry. There were no specific physical examination findings. Laboratory tests showed fasting blood glucose(FBG):227 mg/dl, postprandial blood glucose(PBG):335 mg/dl, hbA1c:%10, triglycerides:85 mg/dl, ldl cholesterol:220 mg/dl, hdl cholesterol:59 mg/dl. He was diagnosed as diabetes and hyperlipidemia. He was advised to use insulin due to guidelines, stop alcohol, have poor dietary saturated fat and carbohydrates, regular exercise, aerating the environment at workplace. He refused using insulin treatment so Metformin+sitagliptin and atorvastatin were prescribed. He was provided psychological support and called for check-up visit a month later. During the first check-up visit we learned that he applied diet, did exercise regularly, used drugs properly. He developed anxious symptoms after stopped drinking. Control laboratory tests showed FBG:105 mg/dl, PBG:177 mg/dl, ldl cholesterol:53 mg/dl, triglycerides:

85 mg/dl, hdl:65 mg/dl. The HbA1C levels decreased to 7.5 than 6.3 at the continuous check-ups. The patient was advised to continue the current treatment and prescribed escitalopram for anxiety. Erectile dysfunction occurred during escitalopram treatment and so is changed with sertraline, erectil dysfunction disappeared.

CONCLUSION

Patient-centred approach increases patients adherence to therapy for chronic illnesses such as diabetes. The diet and exercise in the treatment as well as environmental factors should be regulated, and followed at regular intervals as supportive care. Biopsychosocial and patient centered model should be the basic approach for diabetes patients.

Epidemiology, Complications, Extraintestinal Manifestations and Treatment of Inflammatory Bowel Diseases in Area of Sanliurfa

Ahmet Uyanikoglu¹, Timucin Aydogan¹, Elif Burcu Yavuz², Dursun Cadirci², Ibrahim Arslan¹, Necati Yenice¹

¹Department of Gastroenterology, Harran University, Sanliurfa, Turkey

²Department of Family Medicine, Harran University, Sanliurfa, Turkey

BACKGROUND&AIM: Epidemiological, clinical and treatment characteristics of inflammatory bowel diseases (IBD) cases that followed in Harran University Hospital, Clinic of Gastroenterology were studied.

METHOD: The data of 90 IBD patients that followed in between January 2012 and May 2014 were evaluated retrospectively.

RESULTS: 44 of patients(49%) is women, average age is 32.19±11(16-68) years, average body mass index is 24.1±2.8(17.5-29.4) kg/m². 68 of patients(75%) have ulcerative colitis(UC), 20 of patients(22%) have Crohn's disease(CD) and 2 of patients(3%) have indeterminate colitis. Median age is 9(1-120) months. Serious

complications developed in 9 patients(10%) that followed in; 2 of these had fistulizing CD, 3 patients had bowel resection; 2 with serious bleeding and one had toxic megacolon, one patient had short bowel syndrome due to bowel resection and one patient using infliximab because of fistulizing CD died due to sepsis. Extraintestinal manifestations (EIMs) was determined in 4 patients, including three of ankylosing spondylitis(AS) and other one had peripheral arthritis. On admission 56 of patients(60%) had activated disease. 74% of patients were using 5-amino salicylic acid(5-ASA), 23% of patients were using 5-ASA and immunosuppressives and 3% of patients were using single immunosuppressive in the maintenance treatment. The most commonly used immunosuppressive drug is azathioprine(AZA) and about 25% of patients were using it. Cortisone or budenofalk are used or are being used in approximately 30% of patients. 4 of patients(4%) were using infliximab(2 CD, 2 UC), one of patients(%1) were using adalimumab.

CONCLUSIONS: Our patients with IBD average is in third decade, three-quarters of patients have UC. Complications were observed in 10% of patients including one mortal. EIMs was determined at a low rate according to literature and the most common EIM is AS. Three-quarters of patients were using 5-ASA, one-quarter of patients were using 5-ASA and/or immunosuppressive drugs (most commonly AZA) in the maintenance treatment.

Pneumoconiosis in a Couple of Cat Litter Packaging Worker- A Case Report

Meşide Gündüzöz¹, Murat Büyükşekerci², Türkan Nadir Öziş³, Engin Tutkun⁴, Ömer Hınç Yılmaz⁵

¹Department of Family Medicine, Ankara Occupational Diseases Hospital, Ankara, Turkey

²Department of Pharmacology, Ankara Occupational Diseases Hospital

³Department of Chest Diseases, Ankara Occupational Diseases Hospital

⁴Department of Occupational Toxicology, Ankara Occupational Diseases Hospital

⁵Department of Public Health, Yıldırım Beyazıt University Faculty of Medicine Ankara, Turkey

INTRODUCTION

Silicosis is a chronic pneumoconiosis disease that develops following prolonged inhalation of silica (SiO₂) substance. A six months duration period of exposure to silica dust is enough for the development of the disease. Dyspnea and fatigue are common symptoms. Miners, denim sandblasters, ceramic workers, cat litter production workers, etc. are under risk for silicosis.. Cat litter is produced from a type of clay called the diatomite and contains at least silicon 90%. In this study, we present a cat litter packaging worker couple with pneumoconiosis.

CASE

A couple, 47 years old female patient and 43 years old male patient were admitted to our hospital for dyspnea and productive cough ongoing for one year. They have been both working in a cat litter packaging factory for 10 years and 7 years respectively. History of the patients revealed that they had been occupationally exposed to silica dust and protective equipments in the work place were insufficient. Both patients were diagnosed as pneumoconiosis according to occupational history, pulmonary function tests and HRCT findings.

RESULT

Pneumoconiosis develops as a result of environmental or occupational exposure to silica. Respiratory failure, pulmonary hypertension, cor pulmonale are some complications of this disease. It may progress to progressive massive fibrosis and emphysema. The presence of pneumoconiosis increases the risk of mycobacterium infection. Workplace air must be monitored regarding the occupational exposure limit values of dust concentration. The protective equipments should be regularly used by workers and the work place owners should take preventative precautions.

Keywords: Pneumoconiosis, silica, cat litter.

A Mercury Intoxication Case with a Hand-Made Skin Cream

Meşide Gündüzöz¹, Murat Büyükşekerci², Ceylan Bal³, Engin Tutkun⁴, Ömer Hınç Yılmaz⁵

¹Department of Family Medicine, Ankara Occupational Diseases Hospital, Ankara, Turkey

²Department of Pharmacology, Ankara Occupational Diseases Hospital,

³Department of Biochemistry, Ankara Occupational Diseases Hospital,

⁴Department of Occupational Toxicology, Ankara Occupational Diseases Hospital

⁵Department of Public Health, Yıldırım Beyazıt University Faculty of Medicine Ankara, Turkey

INTRODUCTION

Mercury is a toxic substance. Fucus red, used as a lipstick in the past, was mercury sulfide. Hand-made cosmetic products may contain mercury. The maximum permissible level of mercury in cosmetic products is 1 ppm. In this study, we present a patient with multiple non-specific symptoms who has been exposed mercury by dermal route and had a history of using handmade skin cream for one year.

CASE

A 30-year-old female patient admitted to our clinic for generalized muscle pain, joint pain, abdominal pain, burning sensation in both legs, difficulty in walking and weight loss. She had a white filling in her tooth which was applied last month. She thought it would contain a mercury amalgam and this would worsen her symptoms. The patients' detailed history revealed that she had been using a handmade skin care cream for one year. On physical examination; peeling in both palms, papular eruptions on the face, mild sensitivity on lower extremities and on spinal muscles were observed. No amalgam filling was detected. Urine mercury level was higher than reference value (61.3 µg/L and <10 µg/L respectively). The chelation therapy with DMPS was started. At the end of two months her urine mercury level was 2.3 g/L and she was discharged. After six months she had no previous complaints and her dermal signs disappeared.

RESULT

Exposure to mercury by cosmetic products via dermal route is not a rare case in developing countries. These cases are usually asymptomatic, but muscle spasms, abdominal pain, amnesia, skin eruptions may be nonspecific symptoms. Concerning a heavy metal exposure detailed history should be taken and blood/urinary mercury levels should be monitored.

Keywords: Mercury, cosmetic creams, chelation therapy.

Evaluating the Effect of Education about Diabetes and Foot Care on the Development of Diabetic Foot Ulcer

Esra Demir, Sabiha Banu Denizeri, Ayşe Palanduz

Department of Family Medicine, Istanbul University, Istanbul, Turkey

BACKGROUND&AIM

Diabetes Mellitus (DM), is a chronic disease that requires a regular follow-up, treatment and patient compliance from the moment it is diagnosed. Since, the importance of foot care education is overlooked in DM, diabetic foot ulcer (DFU) remains an important problem. In our study, we aimed to evaluate the effect of education in diabetic patients with or without DFU.

METHOD

A total of 403 patients, 200 of them with DFU followed up in the general surgery or hyperbaric medicine clinics (Group1), and 203 without any DFU followed up in the diabetes department outpatient clinics of Istanbul Faculty of Medicine (Group2), were admitted to our study from July to September 2014. After written consent was taken, a survey with 54 questions about the patients' demographic properties, and their knowledge and attitude about DM was conducted.

RESULTS

The average age of our patients was 62.7±9.95 years in Group1 and 57.4±12.3 years in Group2 (Table-1). The rate of males, uneducated people and people living alone was higher in Group1; whereas, tobacco smokers and alcohol drinkers were significantly lower (all p<0.05). In Group1, the rate of patients having a diabetes duration

exceeding 16 years (50%), receiving an insulin therapy (55.5%) and having comorbidities was higher (all $p < 0.05$) (Table-2). The rate of patients who received foot care education was found 15.5% in Group 1, while it was 61.5% in Group2 ($p < 0.05$). The awareness rate about the educational requirements was 76% in Group1 and 92.1% in Group2 ($p < 0.05$).

CONCLUSIONS

A comprehensive and standardized diabetes and foot care education should be given to all patients right from the day they are diagnosed with DM. Their knowledge and attitude should be evaluated regularly and any insufficiency should be fulfilled. The family doctor leading the primary care team, should help patients develop awareness and preventive health behaviours.

Keywords: Diabetes mellitus, diabetic foot, primary care

Table-1 The Social and Demographic Properties In Two Groups

Property	Patients with DFU (n=200)	Patients w/o DFU (n=203)	p value
Average age (years)	62.7± 9.95	57.4 ±12.3	<0.05
Male, n (%)	137 (68.5%)	95 (46.8%)	<0.05
Uneducated, n (%)	24 (12%)	12 (5.9%)	<0.05
Tobacco smokers, n (%)	17 (8.5%)	39 (19.2%)	<0.05
Alcohol drinkers, n (%)	9 (4.5%)	21 (10.3%)	<0.05
Living alone, n (%)	15 (7.5%)	7 (3.4%)	<0.05

Table-2 Some Variables Related to Diabetes In Two Groups

Variable	Patients with DFU (n=200)	Patients w/o DFU (n=203)	p value
Patients with DM duration >16 years, n(%)	100 (50%)	70 (34.5%)	<0.05
Patients receiving insulin therapy, n(%)	164 (82%)	116 (57%)	<0.05
No diet, n(%)	50 (25%)	40 (19.7%)	<0.05
No exercise, n(%)	164 (82%)	94 (46.3%)	<0.05
Patients who had foot care education, %	15.5%	61.6%	<0.05

Chronic kidney disease with alveolar hemorrhage

Cristina Ana Baquer Sahun¹, Patricia Sanchez Galan², David Ruiz Martinez³, Araceli Fernandez Revuelta¹

¹C.S. Delicias Sur, Zaragoza

²Emergency Department Hospital Barbastro

³C.S. Puente La Reina

Case Description: 77-year-old male with medical history of hypertension, sigmoid diverticulosis and chronic kidney disease (CKD) (diagnosed by Nephrology as secondary to nephrosclerosis, without histologic diagnosis). He was admitted at the Emergency Department because of hemoptysis and dyspnea with oliguria.

Exploration and additional tests: On physical examination the patient was afebrile with 88% oxygen saturation and blood pressure 100/60 mmHg. The pulmonary auscultation showed decreased breath sounds and crackles in both lungs. The blood tests showed: hemoglobin 8,8gr/dl, hematocrit 27%, creatinine 15,6mg/dl, urea 3,08 g/dl, pO₂ in arterial blood gases 65mmHg. Torax Rx ray: cardiomegaly, alveolar-interstitial involvement.

The patient was admitted in Nephrology Department to continue the study. To reach the final diagnosis, several complementary tests were requested:

- Renal biopsy: rapidly progressive glomerulonephritis, with 100% of epithelial crescents

- cANCA 1,04u/ml
- pANCA 20,75u/ml
- Anti-glomerular basement membrane antibodies: positive 3 times

Differential diagnosis: pulmonary-renal syndromes, such as Wegener's granulomatosis, Goodpasture syndrome, Churg Strauss syndrome, polyarteritis nodosa and microscopic polyangiitis, systemic lupus erythematosus, Goodpasture syndrome, essential mixed cryoglobulinemia. We also should keep in mind as differential diagnosis infectious disease.

Diagnosis: Alveolar hemorrhage with rapidly progressive glomerulonephritis and anti-glomerular basement membrane antibodies is diagnostic of Goodpasture syndrome.

CONCLUSION: During admission in nephrology, the patient was treated with plasmapheresis and prednisone, with favorably evolution. Goodpasture syndrome is an autoimmune disease with glomerular basement membrane antibodies that mainly affects the kidneys and alveoli. It is a rare disease and a lower incidence is estimated at one case per million population. This case shows the difficulty of early diagnosis of reno-pulmonary syndrome in cases where there is only kidney clinic, as was our case. Therefore it is very important a thorough medical history along with a detailed physical examination and appropriate complementary tests to make a correct differential diagnosis with chronic kidney disease.

Diabetes and Psychosocial Factors: a Case Report

Catarina Viegas Dias, Catarina Mariano Leal

USF Dafundo, ACES Lisboa Ocidental e Oeiras, Oeiras, Portugal

Background & Aim

Diabetes is beyond doubt a multifactorial pathology, where both physical and psychological factors play an important role. When treatment goals are not met, it is fundamental to understand the underlying causes. Psychological and social problems may be key contributors to a poor diabetes control. The aim of this case report is to highlight the importance of psychological and social assessment as part of the medical management of diabetes.

Case report

We report a case of a 61 year-old male, born in Mozambique, unemployed, and part of a nuclear family (Duvall cycle stage V). He presented as active health problems insulin-treated Diabetes type II with macrovascular and microvascular complications, hypertension, obesity and anxiety. He presented to a routine appointment complaining of knee pain, did not bring self-monitoring records and had a A1C hemoglobin of 8.7%. Since his blood glucose levels were not controlled, the patient was instructed to bring self-monitoring results on the next visit. However, once again the patient did not present adequate blood glucose records. When the physician started to explore disease management expectations and mental wellbeing, the patient reported frequent sadness and anhedonia, which he thought to be related to being away from his family and friends from Mozambique and a loss of social support system.

After this disclosure, the physician further explored the psychosocial environment, optimised psychiatric treatment (since the patient was being treated for anxiety) and referred the patient to a multidisciplinary diabetes consultation. During the following appointments, a social approach was planned to facilitate social integration.

Conclusions

When facing therapeutic non-compliance, it is important to explore the attitudes about the illness, disease management expectations, mental wellbeing and resources. The identification of symptoms of depression and immigrant adjustment problems in this case, allowed the physician to carry an effective patient-centered approach.

HOW to DIAGNOSE GILBERT DISEASE?

Selma Pekgör¹, Orkide Kutlu², Hayriye Şentürk¹, Abdulkadir Baştürk³

¹Konya Training and Research Hospital, Family Medicine, Konya, Turkey

²Konya Training and Research Hospital, Internal Medicine, Konya, Turkey

³Konya Training and Research Hospital, Hematology, Konya, Turkey

Introduction: Gilbert disease is a clinical condition characterized by mildly elevated indirect bilirubin, without findings of hemolysis or liver disease. Basic disorder is a partial failure in glucuronil transferase enzyme and a reduction in hepatic uptake of bilirubin. We present a patient who was easily diagnosed as Gilbert's disease by the identification of indirect hyperbilirubinemia and regression of indirect bilirubin levels one week later.

CASE: 52 years old woman was admitted to the emergency department with complaints of jaundice, weakness, and fatigue. Patient had similar complaints from time to time. Jaundice was improving in a period. On physical examination: general condition was good, arterial blood pressure was 120/70 mmHg, and pulse rate was 70 /dk. Other system examination was normal except jaundice. In laboratory FINDINGS: Total bilirubin 4.9 mg/dl (0.3-1.2), direct bilirubin 0.5 mg/dl (0-0.2), indirect bilirubin 4.4 mg/dl, AST, ALT, GGT, ALP, LDH, CBC, TSH, vitamin B12, TIT within normal limits. Gilbert disease was suspected. One week later the patient was evaluated again. Total control bilirubin was 0.9 mg / dL, and indirect bilirubin was 0.7 mg / dL. So he was diagnosed as Gilbert disease.

Discussion-CONCLUSION: Gilbert disease is a hereditary benign and is the most common cause of chronic indirect hyperbilirubinemia in society. It is an autosomal dominant genetic disorder. It is present at birth but is generally diagnosed the ages of 15-45. Infections, fatigue, sleeplessness, hunger, excitement, sadness as physical and psychological stress can cause to the indirect hyperbilirubinemia or may lead to an increase in existing hyperbilirubinemia. Usually there is no hepatosplenomegaly. Histological examination of the liver does not show pathological findings. Total bilirubin is usually increase to the range of 1-4 mg/dl and rarely exceed 5 mg/dl. In conclusion, as primary care physicians, if we find jaundice and indirect hyperbilirubinemia with out no other abnormality, before referring to the other hospital, we can control the patient one week later. Significant decrease in total bilirubin and indirect bilirubin will show us no further investigation is required.

Keywords: indirect hyperbilirubinemia, Gilbert disease, jaundice

A Case Report of A Silver Ore Worker With Five Different Heavy Metal Exposure

Meşide Gündüzöz¹, Mehmet Erdem Alagüney², Murat Karakurt³, Ceylan Bal⁴, Murat Büyükşekerci⁵, Engin Tutkun⁶, Ömer Hınç Yılmaz⁷

¹Department of Family Medicine, Ankara Occupational Diseases Hospital, Ankara, Turkey

²Department of Internal Medicine, Division of Occupational Medicine, Hacettepe University Faculty of Medicine Ankara, Turkey

³Department of Internal Medicine, Ankara Occupational Diseases Hospital, Ankara, Turkey

⁴Department of Biochemistry, Ankara Occupational Diseases Hospital,

⁵Department of Pharmacology, Ankara Occupational Diseases Hospital,

⁶Department of Occupational Toxicology, Ankara Occupational Diseases Hospital

⁷Department of Public Health, Yıldırım Beyazıt University Faculty of Medicine Ankara, Turkey

OBJECTIVE: The silver ore and processing unit are usually in nearby places. In silver mine the ore is taken away with diggers. Because silver is together with arsenic in the ore the operators of diggers are exposed to arsenic. The ore is distilled with cyanide. The ore contains lead, cadmium, mercury, arsenic, manganese and copper. In the production solvents and silicates are used. The heavy metals and solvents can effect hematological system, central nervous system, kidneys, liver and others.

This case report aims to reveal multiple exposure of a patient working in a silver ore who was monitored with only blood lead levels.

Clinical features: 36 years old male who was working in gold and silver mine for three years applied to our hospital because of high lead level detected in periodic health monitoring. Because of the multiple exposure nature of the work heavy metal profile of the patient is ordered. Blood lead level was 48 µg/l, hair cadmium 6,4 µg/gr (<3 µg/gr normally), 24 hours urinary manganese 3.2 µg/l (<2 µg/l normally), urinary mercury 85 µg/l (<10 µg/l normally), urinary arsenic 50 µg/l (<35 µg/l normally) and urinary thrychloroacetic acid 17 µg/l. The patient was exposed to lead, manganese, cadmium, mercury, arsenic and solvent. Fortunately the patient did not have any end organ damage and discharged with counselation for preventive measures.

CONCLUSION: When toxicological analysis of patients with multiple exposure are done not only a single metal should be analysed but a panel of these metals should be assessed. The physical examination and analysis towards the potential organ damages should be performed. The patients should be followed for future effects of these toxic metals.

Keywords: Silver ore, arsenic, manganese, mercury, lead, occupational exposure

A Case Of Lung Cancer With Chronic Occupational Exposure To Nickel And Asbestos (A Concept For Multiple Exposure)

Meşide Gündüzöz¹, Ceylan Bal², Mehmet Erdem Alagüney³, Murat Büyükşekerci⁴, Türkan Nadir Öziş⁵, Engin Tutkun⁶, Ömer Hınç Yılmaz⁷

¹Department of Family Medicine, Ankara Occupational Diseases Hospital, Ankara, Turkey

²Department of Biochemistry, Ankara Occupational Diseases Hospital,

³Department of Internal Medicine, Division of Occupational Medicine, Hacettepe University Faculty of Medicine Ankara, Turkey

⁴Department of Pharmacology, Ankara Occupational Diseases Hospital,

⁵Department of Chest Diseases, Ankara Occupational Diseases Hospital,

⁶Department of Occupational Toxicology, Ankara Occupational Diseases Hospital

⁷Department of Public Health, Yıldırım Beyazıt University Faculty of Medicine Ankara, Turkey

OBJECTIVE: Lung cancer is the leading cause of deaths from cancer in the world. Nickel is considered to be Group 1 carcinogen for lung cancer according to International Agency for Research on Cancer. This poster presents a patient with lung cancer with occupational exposure to nickel and asbestos.

Clinical Features: 43 years old male was diagnosed lung cancer. He was disassembling isolation material with content of nickel and asbestos. He used to smoke 1 package a day of cigarette for 25 years. Routine laboratory, radiologic and toxicologic analysis were ordered. The metal analysis were performed with Agilent ICP-MS. Routine laboratory workup were normal. The chest x ray revealed 5 cm diameter mass lesion in right hilus, in the distal part of the mass lesion right lung mid and lower zones showed diffuse nodular infiltration and reticulation. Thorax computer tomography showed 45 millimeters irregular lobulated shaped solid mass lesion in right infrahilar region. There was millimetric nodules alongside with peripheral interlobular septum thickening and reticular pattern in the right lung lower lobe (metastasis?, lymphangitic dissemination?). There was pleural thickening in posterior of the lower zone of right hemithorax. The abdominal sequences showed a 80 millimeters hypodense mass lesion in splenic region. The pathology of the mass lesion in the lung was non-small cell carcinoma. The toxicological analysis were in normal reference ranges but nickel was above reference level with 12 ug/L (<8 ug/L normal).

CONCLUSION: Lung cancer is one of the most important causes of cancer deaths. Occupational exposures are very important in the etiology of lung cancer. In these cases alongside with cigarette smoking these factors should be addressed in the perspective of multiple exposure and preventive actions should be taken in order to eliminate the risk due to these agents and exposed groups should be followed closely.

P-0191

From Chronic Constipation to the Celiac Diagnosis

Hayriye Şentürk¹, Saliha Tokgöz², Selma Pekgör¹, Hümevra Yaka¹, Sule Erayman Demirbaş¹, Abdulkadir Baştürk³

¹Konya Training and Research Hospital, Family Medicine, Konya, Turkey

²Konya Training and Research Hospital, Internal Medicine, Konya, Turkey

³Konya Training and Research Hospital, Hematology, Konya, Turkey

INTRODUCTION: Celiac is an autoimmune disease of the small intestine which is triggered by the gluten containing food in patients with a genetic predisposition. It's characterized by malabsorption that is triggered with rye, wheat, barley, and oats intake because of gluten content. Here we present how the diagnosis of celiac disease is performed in an elderly patient with complaints of chronic constipation and iron-deficiency anemia.

CASE: A 71 year old female patient was admitted to the internal medicine clinic with complaints of bloating and constipation. She had constipation for a long time and had been previously received treatment due to iron deficiency anemia. Physical examination was normal except pale appearance. The laboratory assays: Hgb: 10.5 g / dL (12-17), MCV: 79.6 fl (80-96.1), Ferritin: 7.66 ng / mL (13-150), Folate: 5.72 ng / mL (3.8-16), Vitamin B12: 292 pg / mL (191- 663). Endoscopy and colonoscopy were planned to investigate the etiology of anemia. Duodenal biopsy

was taken because the view is compatible with celiac. Biopsy results came in line with celiac disease. TTG IGA:379 (0-20), TTG IGG:negative, Anti-gliadin IgA:positive, anti-gliadin IgG:negative, anti-endomysium:positive, anti-endomysium IgG:negative arrived. The patient was referred to gastroenterology after proposing gluten-free diet. DISCUSSION: Celiac disease can occur at any time during the life. It may lead to typical symptoms such as weight loss, diarrhea, abdominal pain, and nausea but also it may lead to mild or no symptoms for years in some patients. In our case with no symptoms except chronic constipation we diagnosed celiac disease while the etiology of iron deficiency anemia was investigated. As the iron-deficiency anemia due to impaired absorption is common, celiac disease should be considered in the differential diagnosis. Screening for celiac disease should be done in patients with gastrointestinal symptoms, growth retardation, delayed puberty, iron-deficiency anemia, infertility, in women who recurrent miscarriage.

Keywords: celiac disease, malabsorption, constipation

Occupational Health Assessment and Awareness Among Firefighters

Meşide Gündüzöz¹, Murat Büyükşekerci², Ceylan Bal³, Servet Birgin İritaş⁴, Engin Tutkun⁵, Ömer Hınç Yılmaz⁶

¹Department of Family Medicine, Ankara Occupational Diseases Hospital, Ankara, Turkey

²Department of Pharmacology, Ankara Occupational Diseases Hospital,

³Department of Biochemistry, Ankara Occupational Diseases Hospital,

⁴Specialist Doctor of Toxicology, Council of Forensic Medicine, Branch Office for Ankara

⁵Department of Occupational Toxicology, Ankara Occupational Diseases Hospital

⁶Department of Public Health, Yıldırım Beyazıt University Faculty of Medicine Ankara, Turkey

INTRODUCTION

Firefighters can be exposed to toxic metals, pesticides, volatile organic compounds, polyaromatic hydrocarbons by fire fume inhalation. The major metal exposure is arsenic due to copper chrome arsenate (CCA) treated wood. As a result of exposure to fire fume lung and liver functions can be affected. Also long term exposure can lead to a wide range of known and suspected carcinogenic effects. In this study we evaluated 645 firefighters laboratory results retrospectively.

METHODS

Six hundred and forty five firefighters who applied to Ankara Occupational Disease Hospital for medical examination in 2015 were included to this study. Pulmonary function tests, toxicological analyze and radiologic imaging results were obtained from hospital database (FONET). Toxicological results were evaluated according American Conference of Governmental Industrial Hygienists (ACGIH) threshold values.

RESULTS

77 firefighters' urine arsenic levels, 3 firefighters' cadmium levels, 2 firefighters' mercury levels were higher than ACGIH threshold values. Also Hydroxypyrene levels of 2 firefighters and hippuric acid levels of 5 firefighters were higher than laboratory reference range. 21 firefighters' liver enzymes (alanine aminotransferase and aspartat aminotransferase) were above laboratory reference range. 70 firefighter have obstructive type pulmonary function disorder. We detected micro nodules in 68 firefighters' posterior-anterior lung X-ray graphics.

CONCLUSION

Firefighters are under risk of exposure to various noxious materials. So they should be examined thoroughly by clinicians concerning these risk factors. According to symptoms and signs they must be referred to specialized centers for toxicological evaluation.

P-0193

Multi-Morbidity Management in Family Medicine: A Case Report

Rahşan Bulut, Funda Ekimci Deniz, Ayşe Semra Demir Akça, Nejat Demircan, Tuğba Beyazçiçek
Department of Family Medicine, Faculty of Medicine, Bulent Ecevit University, Zonguldak, Turkey

INTRODUCTION: Comorbidity is the occurrence of a new, distinct medical condition in an individual with a chronic disease or, comorbidity is defined as occurrence of specific disease components or additional diseases apart from the investigated disease, whereas multi-morbidity is defined as co-occurrence of the diseases. The aim of the study is to elucidate the significance of multi-morbidity and co-morbidity in primary health care, and to discuss management of the patients with multi-morbidity at primary care and how to follow-up.

Case Presentation: Thirty-seven year old male patient uses metformin (Diaformin®)1000 mg 2x1 regularly for 5 years for type 2 DM. He presented with high blood glucose levels during the last month, malaise, unwillingness and depression. In the physical examination, BP was 130/70 mmHg, pulse rate was 90 bpm, body temperature was 36.5 °C, respiratory rate was 22/min. BMI was 30.5 kg/m². Among biochemical parameters; blood glucose level was 145 mg/dl, 25-Hydroxy Vitamin D was 17.4 ng/ml, HbA1C was 6.3% and VitB12 was 324 pg/ml. In addition to type 2 DM, patient had vitamin D deficiency and obesity. Vitamin D replacement treatment was initiated. Diet and exercise recommendations were made. Patient was referred to a psychiatrist for evaluation of his general depressive state.

DISCUSSION: Family physician can manage patients with multi-morbidities; they act as a conductor in primary care.. When the patient presented to outpatient clinic with diagnosis of DM, he had concurrent obesity, vitamin D deficiency and depression. A family physician who encounters many patients with comorbidities such as this case should consider patient's problems as a whole, and follow patient-oriented-holistic approach.

CONCLUSION: In order to follow up the patient with co-/multi-morbidities, the best choice is the family physician with holistic and psychosocial approach.

P-0194

How to deal with chronic Low Back Pain

Mara Matos Dias

Unidade Saúde Familiar Fiães, ACES ENTRE DOURO E VOUGA I - Feira/Arouca, Aveiro, Portugal

Background & AIM:

After twelve weeks of continuity, low back pain (LBP) is defined as a chronic condition, which corresponds to approximately 2-8% of all LBP. It also represents a prevalent cause of physical disability and work absenteeism, providing a high socio economic impact.

Primary care physicians are struggling to treat chronic LBP, therefore the aim of this work will be a clear and brief exposure of the latest therapeutic options in order to proceed to the most appropriate treatment for the patient concerned.

METHOD: Literature search of systematic reviews and scientific articles from Pubmed database, and Medline. Restricted to articles published between the period 2008 to 2015, in English.

Results: The general approach of the LBP should be performed in a multidisciplinary way, due to multiple mechanisms of chronic pain. The most effective recommendations are exercise and proper posture education, which requires to the patient an active role in their recovery, supervised by a physical therapist in order to, within the wide range of available interventions, select the most suitable.

Drug treatment is superior to non-pharmacological treatments, however, its side effects are greater, implying their use in a very limited time. For example, the continued use of NSAIDs and paracetamol can lead to gastrointestinal problems or renal toxicity. When these treatments fail you can apply low dose of tricyclic antidepressants. Opioids are considered the last resort drug for the treatment and only if all other treatments have failed, given the significant side effects exhibited.

Other therapies such as acupuncture, massage, and mobilization, aren't consensual and fully regulated.

Conclusions

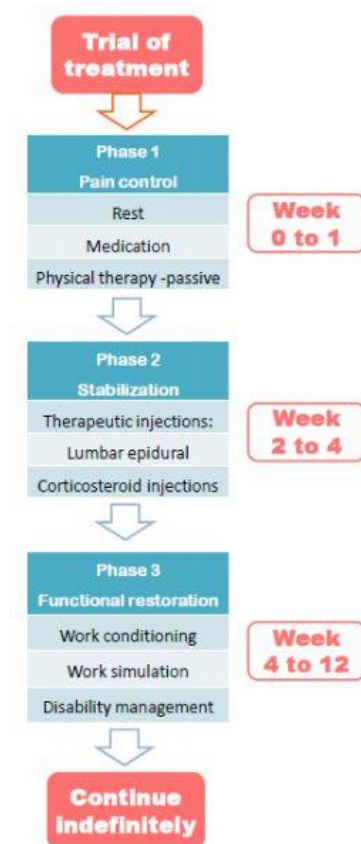

To ensure success, LBP approach must be multidisciplinary and personalized. Such strategies as exercise and postural education have proven efficacy for the treatment, which can be used in combination with pharmacotherapy in the exacerbations or as a adjunct to pain control.

Current prevalence of major cardiovascular risk factors and coronary heart disease in a sample of Greek population

Aristofanis Gikas¹, Nikolaos Tsakountakis², Theodoros Vasilopoulos², Eleni Moreti¹, Chrysanthi Doukareli¹, Chariklia Chatziioannidou¹

¹Health Centre of Kalivia, Kalivia, Attiki, Greece

²Health Centre of Malia, Malia, Crete, Greece

Background and AIM: Cardiovascular diseases represent the leading cause of mortality and a public health economic burden. Comprehensive data regarding prevalence of coronary heart disease (CHD) and associated factors in different geographical regions are very important to our understanding of global distribution and evolution it. This study aims to assess the current situation on self-reported prevalence of conventional risk factors and CHD in Greek adult population.

METHOD: A community-based cross-sectional survey was conducted in May 2014, during an election day, among adult residents of Saronikos municipality (Attica region). Data were collected from face-to-face interviews. The study sample included 2636 subjects (men, 49.5%; mean age, 50.5; range 20-95 years), with similar age and sex distribution to the target population.

RESULTS: The age-standardized prevalence rates of five major risk factors were as follows: type 2 diabetes 11.1%, hypercholesterolemia (cholesterol>240 mg/dl or using cholesterol-lowering medication) 23.8%, hypertension 27.2%, current smoking 38.9% and physical inactivity 43%. Of the participants, only 21% were free of any of these

factors. Clustering of two to five risk factors was more frequent among persons aged 50 years and older as compared with younger ones (60% vs 27%, $P=0.000$). At the same time, the age-adjusted prevalence of CHD was 6.3% (in men, 8.9%; in women, 3.8%) and myocardial infarction 3.6% (in men, 5.2%; in women, 2.1%). According to multivariate analysis age, gender, education level, obesity, diabetes, hypercholesterolemia, hypertension and ever smoking were strongly associated with CHD.

CONCLUSIONS: Classic risk factors are highly prevalent and frequently clustered, especially in adults aged 50 years and older. These findings raise concerns about future trends of already increased rates of CHD. Consequently, more effective interventions are needed, focusing on smoking cessation, promotion of traditional Mediterranean diet and increased physical activity.

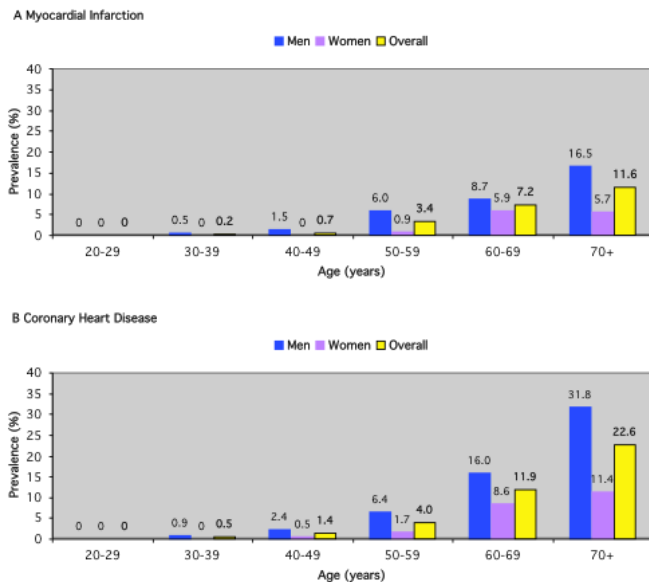

Keywords: Cardiovascular risk factors; coronary heart disease; prevalence

Figure 1. Prevalence of clustering of major cardiovascular risk factors in the age groups of <50 and ≥50 years.

Note: The 5 risk factors include diabetes, hypertension, hypercholesterolemia, smoking and physical inactivity

Figure 2. Age- and gender-specific prevalence of MI and CHD among Greek adults aged 20 years and older.

Evolution of hypertensive patients in a family health unit. Do we make a difference?

Joana Gonçalves¹, Sérgio Aleixo¹, Ana Baptista¹, Stéphane Jorge¹

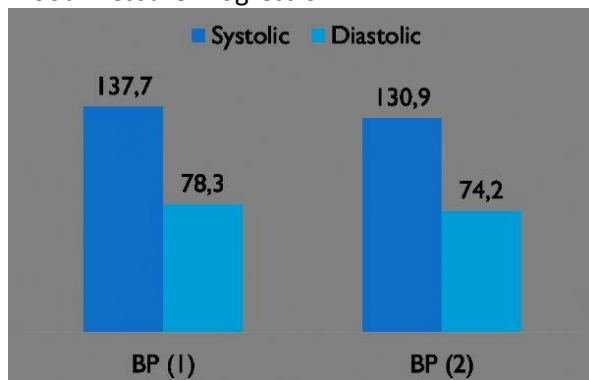

¹Familiar Health Unit Viseu-Cidade, Viseu, Portugal

²Familiar Health Unit Infante D. Henrique

Arterial Hypertension constitutes a cardiovascular risk factor with great global impact. A recent study has shown that it affects 42% of the portuguese population. Aware of this problem, there were organized specific hypertension consultations in Primary Health Care. The purpose of these consultations were blood pressure monitoring, treatment in conformity and control of other cardiovascular risk factors. This study aims to determinet if the inclusion of our patients in these consultations is reflected in a reduction of blood pressure values. Thus we performed a retrospective observational study in a Portuguese Family Health Unit in order to assess the progression of the blood pressure of a sample of patients followed in specific Hypertension program. We included patients followed for at least one year and who attend the consultations at least twice a year. The sample was then comprised 158 individuals. Then we compared the first blood pressure value at the time of the inclusion in the program with the last value of blood pressure registered. We observed a decreased in average blood pressure of 5%. Taking into account that for each percentage of blood pressure reduced the patient will benefit we consider advantageous the existence of this organized hypertension consultations.

Is It Asthma or COPD?

Muhteber Çolak¹, Olgu Aygün², Özden Gökdemir¹, Nilgün Özçakar¹

¹Dokuz Eylül University, Medical Faculty, Family Medicine Department, İzmir, Turkey

²Karabağlar, The Second Family Health Care Center, İzmir, Turkey

BACKGROUND: Asthma is characterized with reversible airway obstruction and hyper reactivity. Chronic obstructive pulmonary disease (COPD) is characterized with progressive airway obstruction and limitation in expiratory airflow. The difference among these two diseases is not always with clear boundaries. Some individuals can show properties of both asthma and COPD. This situation is called as "The asthma-COPD overlap syndrome (ACOS)". This clinic situation took place in international guidelines (GINA-GOLD); it is associated with increasing diversity in the airflow symptoms and described with an incomplete reversible airflow obstruction. ACOS patients are characterized with increased reversibility of airflow obstruction, bronchial and systemic eosinophilia and better response to the corticosteroid therapy compared to patients with COPD. ACOS patients have more wheezing and dyspnea, but cough-sputum characteristics are identical for patients with COPD.

CASE: A 45 year old female patient was admitted to pulmonary diseases clinic with shortness of breath. She has

evaluated as asthma, treated for asthma. She could not have a complete relief of symptoms and had been evaluated as COPD two years ago at a different pulmonary disease clinic. In her history she had dyspnea for 6 years, had pneumonia during childhood and had bronchitis attacks till 12 years old in winters. Our patient has no smoking history, but unfortunately there is passive smoking.

DISCUSSION: In recent years, interest for ACOS associated with asthma and COPD increased. Researches have been done based to determine the ACOS phenotype for patients. Asthma and COPD are chronic and inflammatory pulmonary diseases associated with structural changes of large and small airway. Family doctors should be careful about ACOS patients who has worse clinical situation compared to patients who has only asthma or COPD.

Diagnosis is supported with eosinophilia in diagnostic tests. Awareness and appropriate approach of physicians can avoid losing time with patients seeking diagnosis.

Development of severe hyperbilirubinemia during the FMF attack of a patient with Gilbert's syndrome: Case report

Orkide Kutlu¹, Samil Ecirli¹, Muharrem Keskin¹, Abdulkadir Basturk¹, Sevil Fisekci Oktar¹, Sule Erayman Demirbas², Humeyra Yaka²

¹Department of Internal Medicine, Konya Training and Research Hospital

²Department of Family Medicine, Konya Training and Research Hospital

INTRODUCTION: Familial Mediterranean Fever (FMF) is characterized by attacks of fever and inflammation of serous membranes. Gilbert's syndrome is characterized by indirect hyperbilirubinemia caused by the decrease in the enzyme UDP-glucuronyltransferases. Here we present development of severe indirect hyperbilirubinemia during the FMF attack of a patient with Gilbert's syndrome.

CASE: A 21-year-old male patient was admitted with severe abdominal pain for last 2 days. He had had complaints of fever, abdomen, chest and joint pain intermittently since 17 year old. In physical examination there was a significant conjunctival jaundice. Defense and rebound was detected. Blood pressure 110/70, Fever 38°C, WBC 11.22 10⁹/L (N=3.98-10.04), fibrinogen 430 g/L (N=180-350), CRP 65.5 mg/L (N:0-5) total bilirubin 6.4 mg/dL (0.3-1.2), indirect bilirubin 6 mg/dL (0.3-1.0), LDH 278 U/L (0-248), AST 16 U/L (0-35), ALT 5 U/L (0-35). Abdomen USG was normal. Direct and indirect Coombs were negative. The patient was diagnosed as FMF and colchicine 1.5 mg / day was started. After nearly 24 hours of attack, total bilirubin and indirect bilirubin were decreased to 2.4 and 2.05 mg / dL, respectively. Detection of homozygous M680 (G> C) mutation of FMF gene was confirmed the diagnosis.

CONCLUSIONS: Mild mixed type hyperbilirubinemia (both direct and indirect) can be seen in FMF patients. In a study, total bilirubin and indirect bilirubin levels were detected up to 2.3 and 1.7 mg / dL, respectively in 41 FMF patients. In Gilbert's syndrome indirect bilirubin usually does not exceed 3 mg / dL. And as in our case, it may rarely reaches 6 mg/dL. The difficulty of diagnosis may occur in the presence of unconjugated hyperbilirubinemia higher than expected and in such conditions coexistence of multiple causes should be considered.

Chronic hepatitis B and C in Raval Sud, epidemiological characterisation and prevalence in population attended: HEPACRON STUDY

Adriana James¹, Francisco Montoya¹, Marta Arcarons¹, Berta Tió¹, Oriol Vallcorba¹, Nuria De Villasante², Anna Massana³, Dani Roca¹, Isabel Plaza⁴, Francisca Panadero¹, María Teresa Fuertes¹, Josep Franch¹, Marta Sendra¹

¹Primary Healthcare Centre Raval Sud, Barcelona, Spain

²Centre for Emergency Primary Health Care (CEPHC) Manso, Barcelona, Spain

³Primary Healthcare Centre Clot, Barcelona, Spain

⁴BASIQ; Unit for Assessment, Information Systems and Quality, Barcelona, Spain

Background & AIM: The Raval Sud Primary Healthcare Centre (PHC) attends a young population (80% between 15-64 years of age), with 30% of Hindustani origin (countries endemic for viral hepatitis), a high prevalence of IDU and STI (common risk factors for hepatitis) and a low socioeconomic index (MEDEA 2.29). There are few studies of prevalence of chronic hepatitis (CH) in our region. The prevalence of CH in Spain according to ASSCAT (Catalan association of persons with hepatitis) is 3%, with an under-diagnosis of infection of more than 50%. We are amongst the high prevalence countries in the European Union (>3%). A retrospective observational study done by our research group at the Raval Sud PHC in May 2012 found a prevalence of 2.34 of CH types B and C in the adult population attended. Our aim therefore is to undertake an epidemiological characterisation of these patients.

METHOD: We have initiated a longitudinal descriptive study (3 years of follow-up). A random sample of 59 patients with CH B and/or C was selected in order to estimate a population prevalence of 2.34%. We obtain informed consent in writing from the participants, who complete a questionnaire on risk habits, are submitted to a clinical examination including a physical, and subsequently undergo blood work and abdominal ultrasound.

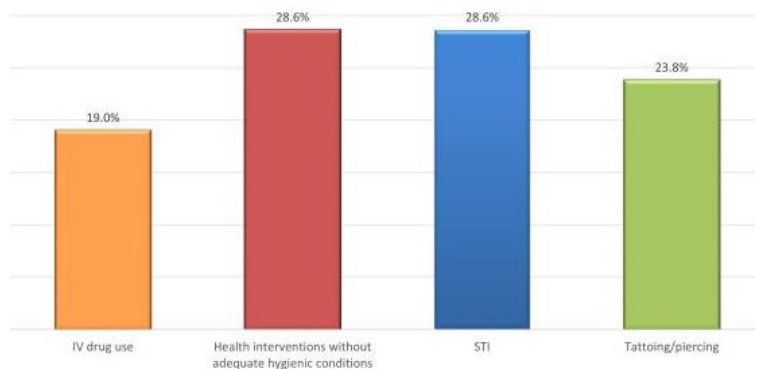

Results and CONCLUSIONS: Project currently underway. 26 patients with CH C were recruited in the first phase, not having yet reached the required sample size. In this paper we describe the characteristics of the patients thus far: 65.4% men; average age: 55 years; 38% present positive serology for hepatitis without a history of inoculation; 28.6% STI (43% syphilis). Of note is the contribution of abdominal ultrasound to the descriptive study: 50% present hepatic steatosis of which 62% was not previously detected.

Chronic viral hepatitis and diabetes mellitus, an emerging association. HEPCRON cohort study

Adriana James¹, Francisco Montoya¹, Marta Arcarons¹, Berta Tió¹, Oriol Vallcorba¹, Nuria De Villasante², Anna Massana³, Dani Roca¹, Isabel Plaza⁴, Francisca Panadero¹, María Teresa Fuertes¹, Josep Franch¹, Marta Sendra¹

¹Primary Healthcare Centre Raval Sud, Barcelona, Spain

²Centre for Emergency Primary Health Care (CEPHC) Manso, Barcelona, Spain

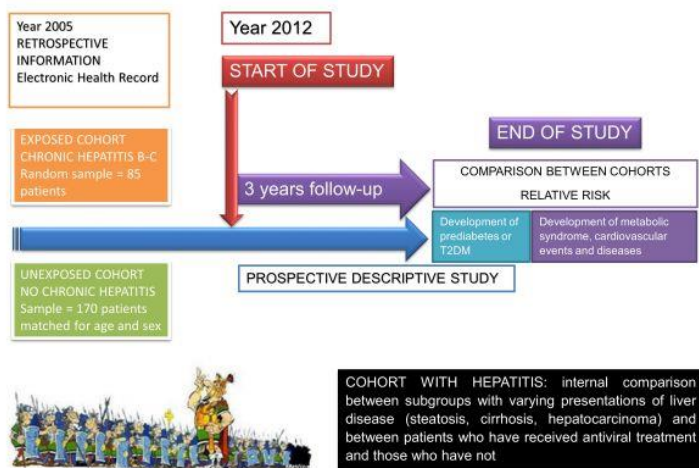

³Primary Healthcare Centre Clot, Barcelona, Spain

⁴BASIQ; Unit for Assessment, Information Systems and Quality, Barcelona, Spain

Background & AIM: Chronic hepatitis (CH) constitutes a global health problem with long-term health consequences (liver cirrhosis, liver failure and hepatocellular carcinoma). There is evidence that CH C is a risk factor for the development of insulin resistance and type 2 diabetes mellitus (T2DM); the role of type B is as yet unclear. In a previous observational study (done by our research group at the Raval Sud Primary Healthcare Centre in 2012) we found the prevalence of T2DM to be three times greater among adult attended patients with CH compared to those without (prevalence ratio=3.02, p <0.00001). No significant differences were observed between CH B and C. Our aim is to analyse the association between CH B and C, and prediabetes and T2DM. **METHOD:** A retrospective cohort study (11 years follow-up) was done by carrying out a search of the electronic health record for diagnostic, follow-up and control parameters of CH B and C, prediabetes and T2DM recorded since 2005. Exposed cohort: adults attended with a diagnosis of CH B and/or C. Random sample of 85 patients. Unexposed cohort: adults attended without CH. Sample of 170 patients individually matched for age and sex. Study initiated in 2013 and prospective follow-up of patients for 3 years. Intervention: participants complete a questionnaire on risk habits, a clinical examination including a physical, blood work and abdominal ultrasound. **Results and CONCLUSIONS:** Required sample size not yet reached. To date we have recruited 36 patients: 26 with CH C, 3 with CH B and 6 from the unexposed cohort (2 being intention-to-treat). 27% of CH C patients developed prediabetes or T2DM after 7.9 mean years compared with 17% of the control group. None of the 3 CH B patients developed prediabetes or T2DM. These results, though tentative, lend support to the hypothesis of our study.

Keywords: Chronic hepatitis C, Diabetes mellitus, Insulin resistance

Study design

Characteristics of groups

Group	Sex (% men)	Age (mean and SD)	Years since diagnosis (mean and SD)
Unexposed (healthy) cohort	50	54.6 (13.15)	--
Patients with CH B	100	49.1 (10.93)	15.1 (9.4)
Patients with CH C	58	56.2 (12.95)	13.1 (11.2)

Relationship of waist to height ratio (WHtR) with diagnosis

WHtR	Mean and SD
Patients with CH C without T2DM nor prediabetes	0.55 (0.098)
Patients with CH C and prediabetes	0.59 (0.000)
Patients with CH C and T2DM	0.66 (0.099)

Biometric index which predicts the risk of developing diabetes and cardiovascular disease. A WHtR of over 0.5 is critical and signifies an increased risk. The WHtR is higher in patients with CH C and T2DM vs patients with CH C without prediabetes or T2DM.

Cases of prediabetes and diabetes mellitus Type 2 according to cohort

Relative risk = 2.06 (95% CI, 0.32-13.26; p=0.37). The preliminary results lend support to the hypothesis of our study but statistically significant results have not yet been obtained having not yet reached the required sample size. Average length of time between the development of CH and T2DM: 13.33 years

case report: uncontrolled type 2 diabetes and hypertension

Ege Özince, Mehmet Ziya Gencer, Seçil Arıca

department of family medicine, okmeydanı eğitim ve araştırma hastanesi, istanbul, turkey

58 years old, a male patient, retired officer;

He has diagnosed with type-2 diabetes in 1989 and oral-anti diabetic drug has been begun.

Long years, patient has come to control irregular in terms of diabetes.

Patient's diagnosed with hypertension in 1998 and salt-free diet was recommended to the patient

Patient hasn't come to control for long years.

He smoke for 44 pack/year, he doesn't use alcohol.

He was admitted to the emergency department because of increased swelling in the legs, intermitant kladikasyo, shortness of breathe fort he last 6 months.

Weight:85 kg, Height:1.75 m.

TA:155/100, tachycardia, orthopnea, tachypnea,

S2 hard, ventricular gallop rhythm.

Bilateral basal crackles in the lung.

Positive godet 2-3 in the bilateral legs edema available.

Hb:11.4 mg/dl Creatinin:3 mg/dl BUN: 43 mg/dl Na:136 mEq/dl

K:4,1 mEq/l Glucose:383 mg/dl HbA1c:% 11.7 Albumin:3,1 total

Cholesterol:137 mg/dl Triglycerides:100 mg/dl

LDL:86 mg/dl HDL:31 mg/dl

Urine Analysis; Density:1009 pH:5.5 Protein:100 mg/dl Glucose:50 mg/dl

24 hour urine sample; Proteinuria: 3410 mg/gün

24 hour urine output: 1200 ml

(PA) Chest-X-ray filmed in emergency, detected increased cardiothoracic ratio,
In thorax CT detected existing bilateral pleural effusions.

EKG; the changes have seen; in which will be compatible with left ventricular ischemia.

ECHO; EF:37%, grade 2 mitral regurgitation, left ventricular hypertrophy, left ventricular wall hypokinesia.

The diuretic treatment was started to the patient. In addition to beta-blocker therapy by the patient receives, ACE-inhibitor was started. The patient whose pre-tibial edema, pleural effusion regressed, shortness of breath got better; TA reached 120/75 mmHg. Oral-antidiabetic drugs have been cut because of insulin treatment was started. The patient whose GFR calculated 32.27, has been evaluated as stage 3 renal failure. Nephrology control has been proposed to the patient. Patient was invited regular policlinic control to family doctor for 3 months period.

Clinical phenotypes of Chronic Obstructive Pulmonary Disease in Primary Care

Eulalia Borrell¹, Teresa Rivera¹, Mger Shafrazym¹, Javier Mezquiriz¹, Nuria Montella¹, Jordi Forcada¹, Eva Muñoz¹, [Maria Teresa Alzamora](#)²

¹Primary Healthcare Centre Sant Roc, Catalan Health Institute

²Primary Healthcare Centre Riu Nord-Riu Sud, Catalan Health Institute

BACKGROUND AND AIMS: COPD is a heterogeneous disease. In 2012 the Spanish guide GESEPOC classified patients in 4 distinct phenotypes, allowing a better individualized treatment.

The aim of our study was to classify by phenotypes and severity COPD patients attended in two primary care centers.

METHODS: We performed a cross-sectional retrospective clinical study in 2012. We reviewed primary care and in-hospital clinical charts of all smoker or former smoker COPD patients (FEV1/FVC<70%). We measured disease severity (GOLD 2008) and classified patients in 4 phenotypes: non exacerbator, overlap COPD-asthma, exacerbator-emphysema and exacerbator-chronic bronchitis following the GESEPOC criteria. The exacerbator patient is characterised by the presence of, at least, two exacerbations the previous year.

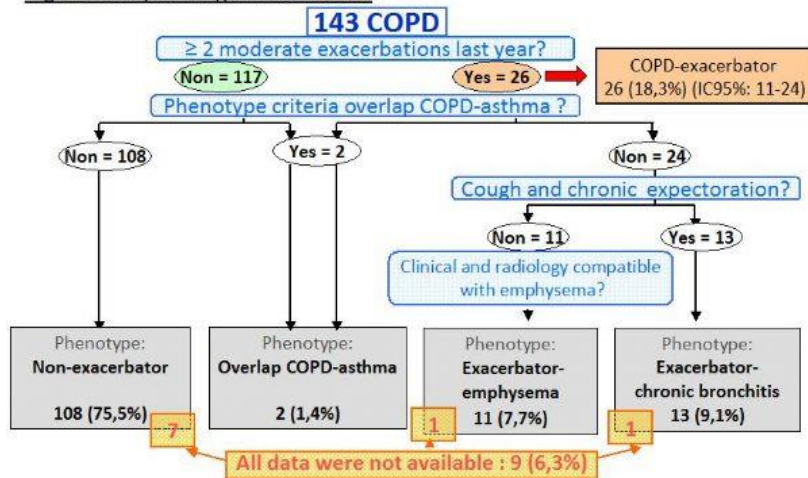

RESULTS: We included 143 COPD patients, 92% male and 76% former smokers. Severity was mild in 18,9%, moderate in 55,9%, severe in 20,3% and very severe in 4,9%. 26 patients (18,3%) were exacerbator patients. They were classified in: non-exacerbator 108 (75,5%), overlap COPD-asthma 2 (1,4%), exacerbator-emphysema 11 (7,7%) and exacerbator-chronic bronchitis 13 (9,1%). We can not classify 9 patients (6,3%) because all data were not available.

CONCLUSIONS: We found similar rates of exacerbators or patients with positive bronchodilator test than previously reported. The absence of some variables, specially related with asthma or atopia, may be produced an over classification in the non-exacerbator group. A good classification of patients and the knowledge of peculiarities of the different phenotypes will allow us to implement a better and more personalized treatment of COPD patients.

²Department of Family Medicine, Atatürk Training&Research Hospital, Ankara, Türkiye

CASE

78 years old woman attended to gastroenterology outpatient clinic with the complaints of abdominal distension and constipation. Overall situation of the lady was intermediate, she was orientated and cooperating. In the examination of vital signs, fever was 36,5 °C, BP: 120/80 mmHg, pulse:98/min, Weight:77 kg, waist circumferens:117cm. In physical examination, abdomen was visibly distended, percussion showed generalized dullness and Traube zone was closed. Both feet dorsum had edema and bilateral pretibial edema (++/++) was observed. In abdominal ultrasound, generalized ascites was observed and the patient was followed for investigating the etiology. In blood analysis, AST:37 ALT:15 GGT:25 ALP:111 Total Bilirubin:0,8 Direct bilirubin:0,4. In Serologic analysis; Anti HBsAg:2.88(negative) Anti HBe:1.03(negative) Anti HBcIgM:0.1(negative) HBsAg:0.5(negative), Anti HBe (IgG)Total:0,004(positive),Anti HCV: negative, Anti HIV: negative, HBeAg:0.094 (negative) and HBV DNA:3,73*10 copy/ml. Cryptogenic liver cirrhosis developed on the ground of occult hepatitis B diagnosed in the light of the findings.

DISCUSSION: Occult Hepatitis B is defined as; detecting HBV DNA(+) in blood or tissues while HBsAg is negative (except window period) usually accompanied by anti HBs(+) or anti HBe IgG (+) antigens. OHB can develop by decreasing of HBsAg to unmeasurable levels after long years of HBV carriage. It is known that OHB may cause HBV transmission by blood transfusions. Transmission by organ transplantation or perinatal way is also possible. Even the new techniques on HBsAg measurement, it is still misleading to use it as a marker for HBV infection in some cases. Apart from HBV transmission by blood transfusion, OHB should be remembered in ALT elevated patients with unknown etiology, cryptogenic liver diseases, liver transplantation donors and hemodialysis patients. While screening of anti-HBe seems to be cost effective in blood transfusions or organ transplantations, screening all the cases with PCR should be recommended by becoming inexpensive of PCR in the future.

Keywords: occult hepatitis B (OHB), cryptogenic liver cirrhosis

Primary Hiperaldosteronism: Case Report

Ahmet Ünal¹, Yunus Gürel¹, Engin Güney², Hatice Özer²

¹Department of Family Physician, Adnan Menderes University, Aydın, Turkey

²Department of Endocrinology, Adnan Menderes University, Aydın, Turkey

INTRODUCTION

Hypertension (HT), showing a high prevalence in the whole world, is a major public health problem that increases the risk of cardiovascular and cerebrovascular disease. In 2025, 1.5 billion people are affected by hypertension on the world. Also, it ranks as the foremost cause of death in the world. Identified in approximately 5% of patients with hypertension can show a reason, that is called secondary hypertension. We present a case of primary hiperaldosteronism were being overlooked in primary care.

CASE REPORT

A 63-year-old man with an 8-year history of hypertension, which had previously been moderately controlled with several classes of antihypertensive drugs. The patient was admitted to the emergency room of our hospital with complaints of weakness in his left hand 3. 4. and 5. finger, the complaints started yesterday. He was using nebivolol 5 mg and amlodipine 10 mg. His blood pressure was 200/120 mmHg with hypokalemia (2.1 mmol/L). He did not have any history of weakness or numbness due to hypokalemia. Venous blood gas pH: 7.46. Glycerol trinitrat was given with IV infusion for hypertension. His plasma aldosterone concentration (PAC) was elevated (122 ng/dl; reference value, 3.6 to 24.0) with suppressed plasma renin activity (1.7 ng/ml/h; reference value, 0.3 to 4.2), PAC/PRA: 71.76. Abdominal CT scanning showed nodular increase in thickness in the left adrenal gland. 14 mm thick was measured in the adrenal glands. Abdominal MR showed adrenal myelolipoma. Medical treatment was planned, because it's not adenoma. His treatment with spironalacton 2 x 100 mg was continued. In follow-up, blood pressure and potassium was measured in normal range.

CONCLUSION

In primary care, be careful about the causes of secondary hypertension which can be treated.

Prevalence and assesement of hypersexual disorder in primary health care

Erik Lindqvist, Lena Nordeman

FoU centrum Södra Älvsborg, Västra Götalandsregionen, Sweden

Background & AIM: There is a lack of knowledge about the number of patients consulting for and/or discussing the problems that can be characterized as hypersexual disorder (HD) with healthcare providers in primary care. Through a comprehensive survey including all persons within three professions in a geographical area, the study will describe the proportion of those health care professionals who encountered patients with the problem, and with good probability present the degree to which profession, gender and working years/experience can explain if one encountered patients with the problem or not. It will also bring to light how the problem is assessed.

METHOD: Cross-sectional study, web-based questionnaire.

All general practitioners, psychotherapists and district nurses in primary care within the region of Västra Götaland, Sweden will be invited to participate by e-mail. The e-mail will contain information about the study and a link to a web-based questionnaire including eight items.

Data will be analyzed and presented descriptively. Logistic regression will be used to analyze the association between participants answering that they had encountered patients with the problem (1) or not having encountered patients with the problem (0) as the dependent variable and the profession; physician (1) other professionals (0), sex and work experience as explanatory variables.

Expected RESULTS: This study aims to provide knowledge about the prevalence of HD among patients consulting primary care and will provide insights about the intervention being offered. In time the results will hopefully have an impact on the awareness of the problem and the development of history taking and how the history reveals symptoms consistent with HD.

COPD patients know the proper use of inhalation devices?

Hector Leonardo Lugo Ramos, Jose Maria Fernandez Gonzalez, Rocio Lobato Martinez
Hospital Jerez de la Frontera - Cadiz

OBJETIVES

Evaluate the use of inhaled therapy in COPD patients of a Health Center: What inhalers are easier to handle and if the technique It is properly explained by the family doctor and understood by the patient.

MATERIAL AND METHODS

Survey of 150 patients diagnosed With COPD Treated With different devices(pressurized metered dose, single-dose dry powder multidose dry powder and spray without Propellants). The survey collected age and sex, type of device, if there was an explanation for His medical technique in the prescription medication and Which of them find it Easier to apply.

RESULTS

The survey shows male patients 68.7 +/- 8.3 years of age profile. It shows that in 51.9 % of cases the patient has not received explanation technical by their doctor or not well understood.Among the devices easier application is in first place pressurized metered dose device (61.3%), followed by Breezhaler (36.5%) and the Easyhaler (2.2%). 39.5 % of those using the pressurized system makes with Inhalation chamber. It notes that 25.4 % of patients abandoned treatment occasionally by difficulties in implementing the product.

CONCLUSION

Most COPD patients are elderly and need simple systems for easy application. They require time in the query to the explanation of the technique that the treatment is effective and reduce exacerbations and especially because adherence to treatment will be improved. Nearly a third has left the therapy device difficulties.

The role of rehabilitation (motivation) on patient recovery after hypoxic brain damage caused by epi status

Vesna Tabak¹, Damir Tabak², Mladenka Vrcic Keglevic³

¹Family Practice „Dr. Vesna Tabak“, Brescenskog 3, 10 000 Zagreb, Croatia

²University of Zagreb, Salata 3, 10 000 Zagreb, Croatia

³Foundastion for the Developmnet of Family Practice, Cresnnjevec 32, 10 000 Zagreb, Croatia

INTRODUCTION: Besides headache, epilepsy is the most common neurological disease. The aim of this paper is to present the role of the patient and his family in a long term rehabilitation after hypoxic brain damage.

CASE: During a travel, a 34-year patient was found uncouncious in a hotel. The patient recieved CPR, was hospitalized for a month and being in coma for three weeks. The cause of the epileptic attack wasn't found. During hospitalization many complications ocurred: rabdomyolysis, acute kidney failure treated by hemodialysis, liver function impairment and a bilateral pleural effusion. The effusion was drained during which the intercostal artery ruptured caused hematothorax accompanied with asistoly and five minute resuscitation. The MRI findings described bilateral hypoxic lesions in the upper frontal lobe and cortically. After he awoke from the coma he was hospitalized in Zagreb for two and a half months during and he was treated with antiepileptics. After being discharged the patient was orientated in time and space with ataxic, impaired walk, as well as periodical involuntary movements. The speech was disartric and the sight was weakend and blurred. Rehabilitation began in the hospital, contiuned at home and then in physical therapy facility. He recieved physical, speech and sight therapy. Two years later he returned to work. He has a mild leftsided hemiparesis with normal walk. His speech is somewhat slower but normal as well as his sight. He is on antiepileptics even though the primary epilepsy cause remained unknown. He got married and fathered a boy in 2013.

CONCLUSION: This is a case report of the patient in who's successful recovery the crucial role had his personality and family. He's an example where the primary care physician should apply the bio-psycho-social approach, use not only medical, but every other patient's abbility in achiving the goals.

A Case Report of Diffuse Panbronchiolitis Diagnosed within 6 Months in Southern Taiwan

Lee Meng Tse¹, Ou Ling Chun¹, Lin Chi Cheng², Lin Chao Li¹, Chou Hsin Tan¹, Tung Chih Kang¹, Tseng Hsu Hung¹

¹Department of Family Medicine, Antai Medical Cooperation Tien Sheng Memorial Hospital, PingTung, Taiwan

²Department of Chest, Antai Medical Cooperation Tien Sheng Memorial Hospital, PingTung, Taiwan

Background & Aim

Diffuse panbronchiolitis (DPB) is a kind of progressive obstructive lung disease of unknown etiology. It always takes one to four years in average to diagnose DPB since onset of symptoms from literature review. We presented an experience about diagnosing the 62-year-old female patient with advanced stage of typical DPB within 6 months in southern Taiwan.

Method

The 62-year-old female visited for chronic productive cough, recurrent wheezing, rhinorrhea and breathlessness. After history taking and thorough physical examination, white blood cell with differential count and arterial blood gas were checked. Chest x-ray, acid-fast stain and sputum culture were checked for ruling out pulmonary tuberculosis infection. Arrangement of pulmonary function test was for dyspnea, follow-up of treatment effect, and high resolution computed tomography for ruling out interstitial lung diseases and malignancy. Ear-Nose-Throat specialist was also consulted.

Results

DPB was diagnosed because of fulfilling the 1st, 2nd, 3rd, 4th and 5th criteria of DPB, showed as following: (1) Persistent cough, sputum and exertional dyspnea (2) History of chronic sinusitis (3) Bilateral diffuse small nodular shadows on plain chest x-ray or centrilobular micronodules on chest computed tomography (4) Coarse crackles (5) FEV1/FVC < 70% and PaO2 < 80mmHg (6) Titer of cold hemagglutinin ≥ 64. The patient clinically improved by erythromycin treatment thereafter not only symptoms relief but also improvement of pulmonary function test and chest x-ray.

Conclusions

DPB mainly occurs in East Asia and sporadic case reports in Western countries. The prevalence rate is 11 per 100,000 populations among the Japanese. The prognosis was poor, with 5- and 10-year survival rate of 62.1 and 33.2%. Long-term therapy with macrolide antibiotics resulted in clinical significant improvement. This was the first patient diagnosed within 6 months in Southern Taiwan. The earlier diagnosis of DPB, the better prognosis in such kind of patient is.

Erythromycin treatment since Oct, 2013			

Follow-up of series chest x-ray

DPB was diagnosed and on Oct, 2013; then erythromycin treatment started and continued for nearly 8 months. Series chest x-ray revealed significant improvement of infiltration on both lungs.

HRCT on 2013/10/15

bronchiectasis, bronchiolectasis, with tree-in-bud infiltration on both lungs

P-0209

{The Process of Accepting the Diagnosis of a Chronic Illness}

Saliha Şahin, Saliha Serap Çifçili, Yeliz Özendi, Kübra Nur Demir
Department of Family Medicine, Marmara University, İstanbul, Turkey

It's established that, when a person face the diagnosis of a chronic disease, he/she can go through the stages for mourning of Kubler Ross (shock, denial, anger, bargaining, withdrawal – depression, acceptance). Lacroix and Assal also described two other stages named; obedience and pseudo-acceptance. If one of these stages prolongs, the process of treatment adherence may delay as well. Non-compliance to diet and insulin injections in patients with type 2 diabetes is well-defined in the studies.

With a case report, we want to open discussion about the effects of prolonged treatment non-compliance process in chronic diseases. The case is a 59-year old female with type 2 diabetes, diagnosed 10 years ago. She has presented with Herpes Zoster infection, has had hypertrophic lichen planus lesions on both feet and autonomic neuropathy symptoms, presented with urinary incontinence. Fasting blood glucose was 329 mg/dl and also had cataract operation. She expressed that she did not want to use insulin injections. More importantly, although many years had passed since the first diagnosis, she was still questioning why she has had this illness. After two appointments, fasting blood glucose levels were regulated. However, she did not come to her follow-up visits. What kind of approach do you recommend in such patients?

Keywords: type-2 diabetes, Kubler Ross, treatment non-compliance, pseudo-acceptance

⁵Department of Internal Medicine, State Hospital, Ordu, Turkey

BACKGROUND & AIM: The aim of this study was to investigate the correlation between rheumatoid arthritis (RA) and mean platelet volume (MPV) and red cell distribution width (RDW), which are parameters of routine hemogram tests, that are suggested to be related with inflammation.

METHODS: We included 81 patient with RA in this retrospective study. Control group was consisted of 80 healthy subjects admitted to our instutation for a routine check up. White Blood Cell Count (WBC), Hemoglobin (Hb), RDW, Platelet Count (PLT) and MPV values of the participants obtained and analyzed.

RESULTS: We found that, RDW and MPV values were significantly diffrent in patients with RA compared to control subjects.

CONCLUSIONS: We think that, MPV reduction and RDW elevation is associated with RA. However, prospective studies with larger population are needed to reveal the relationship between the disease activity and RDW and MPV.

AIM: Osteopathies are an important cause of morbidity in thalassemia major (TM). We aimed to evaluate osteopathy in thalassemia and biochemical indices and to emphasize the precautionary measures or awareness in the early diagnosis of osteoporosis.

METHODS: 37 TM patients (18 female, 19 male) were included in the study. Bone mineral densitometry (BMD) was determined using dual energy X-ray absorptiometry from lumbar vertebrae. Z scores of; <-1 Normal, -1-2 osteopenia, > -2 was considered as osteoporosis.

RESULTS: The mean age was 15.48 ± 6.96 (5-33) years. 9 patient's Z scores (24.3%) were normal, 5 of osteopenic (13.5%), 23 patients were osteoporotic (62.2%).

In osteoporotic group following parameters were high; ALP in 6 patients (16.2%), AST in 5 patients (13.5%), ALT in 8 patients (21.6%), TSH in 2 patients (5.4%), fT4 in 6 patients (16.2%), fasting blood glucose in 4 of (10.8%), ferritin in all. Ca and P values were normal in all. PTH was low in 2 patients (5.4%), vitamin D deficient in 12 (32.4%) of. Lumbar BMD was positively correlated with age (r = 0.696 p = 0.000), height (r = 0.822 p = 0.000), weight (r = 0.852 p = 0.000), BMI (r = 0.725 p = 0.000), negatively correlated with ALP (r = -0.565 p = 0.006) and AST (r = 0.494 p = 0.014).

In osteopenic group; vitamin D deficient in 2 patients (5.4%) and other biochemical parameters were found normal. Lumbar BMD was positively correlated with age (r = 0.951 p = 0.013), weight (r = 0.916 p = 0.029) and BMI (r = 0.932 p = 0.021), negatively correlated with ferritin levels (r = -0.906 p = 0.034).

CONCLUSION: Osteopathy rates were high in TM. Measure of BMD and metabolic profile during routine follow-up of TM patients and early treatment will reduce complications.

BACKGROUND: Lymphadenopathy may be the first symptom of many diseases and an important cause of morbidity if late diagnosed. We aimed to investigate peripheral lymphadenopathy results taken by excisional biopsy.

METHODS: Histopathological examination of 185 lymph node biopsy specimens was evaluated during 6 years of follow-up.

RESULTS: The average age of patients ranged from 1 to 86 was 41.01+20.62 years. 87 of were female, 98 of male. 62 (%33.5) of excisional biopsy materials were benign lesions and 123 (% 66.5) of malignant. Benign lesions were consisted of reactive hyperplasia, cat-scratch disease, toxoplasmosis, necrotizing /non-necrotizing granulomatous. Of these patients, 40 had nodes with reactive hyperplasia (15 female/25 male, mean age: 27.35 y), 14 had necrotizing granulomatous disease (9 female/5 male, mean age: 39.86y), 2 non-necrotizing granulomatous disease (1 female/1 male mean age: 43y), 4 had cat-scratch disease (1 female/3 male mean age: 54.25y), 1 toxoplasmosis (26 y, female), 1 kikuchi disease (25 y, female). In the evaluation of malign lesions; 38 were hodgkin lymphoma (HL) (%20.5, 17 female/21 male, mean age: 34.89y) (18 nodular sclerosane type, 12 mixt cellular type, 8 lymphocyte predominant), 77 had nonhodgkin lymphoma (NHL) (%41.6, 37 female/40 male, mean age: 52.26y) (54 of diffuse large cell, 10 of follicular lymphoma, 4 of peripheral T-cell, 3 of mantle cell, 3 of B cell rich T cell lymphoma, 2 of small cell lymphocytic lymphoma, 1 with marginal zone lymphoma), 8 metastasis (%4.3, 5 female/3 male, mean age: 53.5y). Reactive lymphadenopathy observed most common in cervical region, NHL in axillary-abdomen-inguinal-mediastinum and HL in the supraclavicular region.

CONCLUSION: Excisional biopsy can be applied safely with minimal morbidity and mortality and a gold standard diagnostic method of lymphadenopathy. Although lymphadenopathy is mostly related with benign lesions, malignancy should be kept in mind in the differential diagnosis.

Secondary prevention and treatment of depression episodes in Patients with Diabetes in a rural area of Greece

Foivos Evangelos Kakavitsas¹, Emilia Grammenandi², Ioannis Perakis¹, Spyros Zoupas¹

¹Health Center of Aghios Athanasios Kerkyra - Greece

²private practice Kerkyra - Greece

BACKGROUND & AIM: Evidence from studies demonstrates that the presence of diabetes increases the risk of comorbid depression. Preventing depression recurring episodes in diabetic patients is clinically relevant. The purpose of the study was to determine in a rural area of Greece, if the diabetic patients are receiving the recommended secondary prevention care for depression episodes from primary care physicians and the effectiveness of the intervention in those patients.

METHOD: We used a randomized clinical trial (RCT) study of 681 adults with diabetes living in rural areas of Corfu island, that filled in the Patient Health Questionnaire (PHQ-9) for depression screening. Patients with a positive depression screening were invited to provide access to their health care clinical records.

RESULTS: 217 (31.86%) of diabetes patients screened positive for minor, moderate or major depression. Among these, 132 (60.83%) had a new depression diagnosis. Diabetes patients with mild depression symptoms were less likely (23.47%) to be at a conventional antidepressant management (H=6,971, p=0.033). In addition conventional antidepressant management strategies for mild and moderate depression were received in 47.2% of the patients with major depression (H=9,526, p=0.029). 45 (52.94%) of 85 treated patients (according to their medical records) responded to antidepressant treatment, with a reduction in depressive symptoms (H=6,820, p=0.007).

CONCLUSIONS: The optimal depression screening and treatment in rural primary care in Greece of diabetic patients still has some way to achieve. Despite guidelines, many patients fail to receive recommended secondary prevention care for depression episodes. Detection of depression episodes in those patients is important as it improves patient care, quality of patients life and reduces other signs and symptoms of depression in the majority of patients.

Raynaud's Phenomenon - Case Report

Clara Mendes¹, Vanessa Sá², Nicole Marques¹, Ana Filipa Dias¹, Janine Correia³, Mafalda Salvador¹

¹USF Monte Pedral, ACES-Lisboa Central, Portugal

²Centro Hospitalar Lisboa Central, Portugal

³USF Oriente, ACES-Lisboa Central, Portugal

Raynaud's phenomenon (RP) is a common clinical manifestation (3 to 5% of world population) which is characterized by episodes of transient ischemia digital of one or more fingers or toes. It may be primary or secondary to several diseases or conditions, often being the first manifestation of such diseases. The differential diagnosis between primary and secondary RP is made by clinical history, physical examination, immune analysis and capillaroscopy. Most patients with primary RP needs only behavioral therapy and smoking abstinence. When these measures are ineffective blockers of calcium channels are the first line.

The objective is to present the clinical case of a 30-year old female, with asthma and smoker, who came for a consultation because of swelling and digital cyanosis in both hands associated with cold. The physical examination only revealed cold fingers with sharply demarcated cyanotic skin (without findings suggesting tissue ischemia). In this first consultation we requested blood analysis (CBC, ESR, ANA, TSH and protein electrophoresis) and explain how important it was to stop smoking and prescribed nifedipin, as the diagnosis impression was the RP. Two weeks later she was better and brought the blood analysis results which only showed a positive ANA (1/200 specklet). Because in primary care set we could not ask for a capillaroscopy we sent her for a hospital consultation where she repeated the blood analysis. The results were normal (including ESR) and she's still waiting for capillaroscopy.

The purpose of this case report is to alert for this condition, listing the diagnosis criteria, facilitating their suspicion and forwarding timely and adequately the patient. The family doctor has the advantage, due to the holistic nature of his practice, of being able to carry out a longitudinal follow-up of these users, as 12.6 % of patients with RP develop associated disease.

Effects of Sleep Disorders On Quality of Life among Type 2 Diabetes Patients

Mehmet Akman¹, Ahmet Said Dünder², Ayşe Eren², Banu Çelik², Furkan Batuhan Güven², Gürkan Ayaz²

¹Department of Family Medicine, Marmara University, Istanbul, Turkey

²Medical Student, Marmara University, Istanbul, Turkey

Background & AIM: The prevalence of type 2 diabetes is increasing significantly in Turkey and in the world. It is reported that diabetes causes decline in quality of life. The aim of this project is to determine whether sleep disturbances are seen more predominantly among diabetic patients compared to patients seen in primary care with acute problems. Secondly possible relation between sleep disturbances and quality of life among diabetic patients is explored.

METHOD: This study was conducted in Marmara University Training and Research Hospital. Among 160 patients contacted 135 gave consent to participate (diabetic: 70; control: 65). A pre-prepared questionnaire together with Epworth, Berlin, COOP/WONCA and Pitsburg scales were filled by participants.

RESULTS: 74.5% of the participants were female. The average age was 43.8±14.8 years. According to Berlin scale results possible sleep apnoea was detected in 87.1% of the diabetic patients and day time sleepiness was 51.4% (Epworth scale). Compared to control group, Diabetic patients between age of 30-49 have significantly more day time sleepiness (10.3 vs 55.6%) and possible sleep apnoea rate is significantly higher among the diabetic patients aged over 50 years (60% vs 95.3%). Among diabetic patients having higher 'daytime sleepiness degree' have also more depressed mood and higher anxiety (p<0.05).

CONCLUSION: The low quality of sleep and sleep disorders such as sleep apnoea seen more frequent among diabetes patients. Sleep disturbances seems to worsen quality of life of diabetic patients. During routine primary care visits, we advice primary care doctors to screen their diabetic patients for sleep disturbances.

Keywords: sleep disorders, diabetes, quality of life

Dilated miocardiopathy associated with breast cancer therapy – Case report

Vitor Esteves¹, Melanie Ferro², Luís Semedo³, Catarina Bettencourt¹

¹USF Buarcos, Figueira da Foz, Portugal

²UCSP Montemor-O-Velho, Montemor-O-Velho, Portugal

³Hospital Distrital da Figueira da Foz

BACKGROUND: Dilated cardiomyopathy (DCM) is a progressive disease characterized by ventricular chamber enlargement and contractile dysfunction with normal left ventricular wall thickness. DCM has multiple etiologies being the third cause of heart failure (HF) and the most frequent reason for heart transplantation. Doxorubicin (DOX), an anthracycline anticancer drug, is an effective and frequently used chemotherapeutic agent for various malignancies. However, its usefulness is limited by the cumulative cardiotoxicity that can lead in the long term to DCM and HF.

METHODS: We describe the case of MHDB, a 70-year-old caucasian female, with a bachelor's degree in business administration, retired, belonging to a nuclear family, highly functional, in Phase VIII of Duvall's cycle. Medical

history of left radical mastectomy due to infiltrative ductal breast carcinoma in 2009, adjuvant chemotherapy with doxorubicin and radiotherapy. Follow-up with oncology appointments since then. In March 2015 had an appointment due to shortness of breath with four months of evolution, fatigue, functional class II NYHA, orthopnea and palpitations. On physical examination pulse rate was 126/min, blood pressure 136/88mmHg, normal cardiopulmonary auscultation, peripheral venous congestion and edema and ECG showed sinus tachycardia.

RESULTS: An echocardiogram was ordered showing decreased global systolic function, with severe diffuse hypokinesis (ejection fraction 21%). Carvedilol 6.25mg/day, lisinopril 8mg/day and furosemide 40mg/day were initiated. One month later the patient came to our attention as symptoms persisted, aggravated by cough of recent onset, which led to abandon all medication. Carvedilol and furosemide were reintroduced and candesartan 8mg/day added and progressive clinical improvement was observed.

CONCLUSIONS: DOX induced DCM leads to severe morbidity and mortality, being essential to assess cardiovascular events and establish early diagnosis in these patients. Thus, close cooperation between cardiologists, oncologists and family physicians is crucial, to balance the risks and benefits of cardiotoxic anticancer therapy and ensure adequate follow-up plans.

Lowering and Monitoring Serum Urate Levels in Gout

Maryam Ahmed

North Hampshire Hospital, Basingstoke, United Kingdom

Hyperuricaemia (serum urate level [sUA] $\geq 360\mu\text{mol/l}$) is prerequisite for development of gout. Reducing, maintaining low sUA levels prevents re-accumulation of urate crystals, development of complications, improves physical function. Allopurinol, a urate-lowering therapy (ULT), is traditionally first line treatment used in long-term control of gout. Once therapeutic sUA level is achieved, annual assessment of levels recommended for optimal long-term gout management. This re-audit assesses current sUA monitoring according to guidelines and if whether patients are being treated to target.

METHOD: This retrospective study uses EMIS Web Healthcare System, containing medical records of all primary care patients at Furnace Green Surgery. Patients ≥ 18 years old, with a diagnosis of gout (code C340 - 1443) and on Allopurinol from 3/12/13 – 3/12/14 were included. Patients with a first presentation of gout between 3/12/13 – 3/12/14 were excluded.

RESULTS: There are 7000 registered patients. 178 (2.5%) patients were ≥ 18 years old with diagnosis of gout. This is a 1.2% reduction from 3/12/12 – 3/12/13. Of 178 patients, 63 had Allopurinol prescribed on their repeat prescription (35.4%, 64% males, mean age 65 +/- 21 years). This is a 9.7% increase from 3/12/12 – 3/12/13. 14 patients (22.2%) had their sUA monitored between 2013-2014 of which 6 patients (42.9%) had a raised sUA. 3 patients had their dose adjusted with no subsequent sUA follow up, 3 had no dose adjustment.

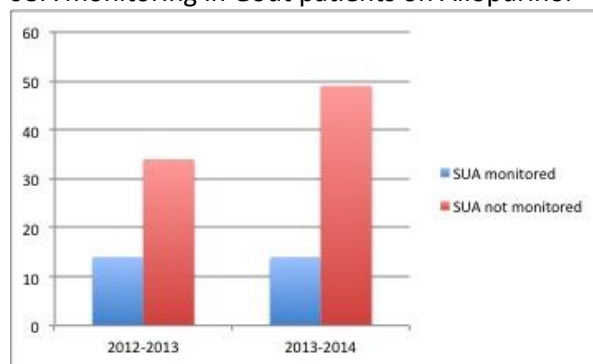

CONCLUSION: Gout monitoring has fallen below standards. Dosing Allopurinol appears to be happening as a sole event after an acute attack and sUA levels are being used as a diagnostic test than a measurement of treatment efficacy. Although this only represents one practice, with relatively small patient numbers on a specific ULT, it is extremely important that clinicians are familiar with current guidelines for gout in order to improve the quality of care for patients.

sUA Levels

sUA monitoring in Gout patients on Allopurinol

sUA monitoring in Gout patients on Allopurinol

	2012-2013	2013-2014
sUA Monitored	14	14
sUA Not Monitored	34	49
Total	48	63

The total number of patients who had their sUA monitored between 2013-2014 are 14 (22.2%). This total number remains unchanged from 2012-2013 despite there being an increase number of patients with a diagnosis of gout and taking Allopurinol.

sUA Levels

	2012-2013	2013-2014
sUA ≥ 360	11	6

sUA <360	3	8
Total	14	14

14 patients that had their sUA monitored between 2013-2014, 8 had their SUA level with target (57.1%), which is considerably more patients within target then the previous year.

P-0218

Barriers to diagnosing and management of COPD in GP/FM

Nena Kopcavar Gucek

Department of Family Medicine, Medical School, University of Ljubljana, Slovenia

BACKGROUND: The diseases of the respiratory system remain important public health burden, the chronic respiratory diseases are particularly important. Regarding their prevalence, limited data exist in the population and in primary care. As COPD is greatly underdiagnosed and undertreated in all environments, this abstract brings an overview of various possibilities of managing COPD in the GP/FM.

Contents: A short validated patient-completed questionnaire, the COPD Assessment Test (CAT) presents a possibility of assessing the impact of COPD on health status. It has good measurement properties, is sensitive to differences in state and should provide a valid, reliable and standardised measure of COPD health status with worldwide relevance. San Diego Shortness of Breath Questionnaire (SOBQ), a 24-item measure that assesses self-reported shortness of breath while performing a variety of activities of daily living, has been proved to be a valuable assessment tool in both clinical practice and research in patients with moderate-to-severe lung disease. A simple computer algorithm has also been considered by UK General Practice Research Base (GPRB) to identify patients with COPB and assess the severity of the diseasee. Routine screening/spirometry of all patients, who are smoking, also presents a reliable follow-up of already diagnosed patients. Due to the overload and difficult access to spirometry of GP/FM in several EU countries, it is not allways feasible. As an example of good practices in Slovenia, the introduction of model practices, a trained nurse has been introduced to assist in the early diagnosing as well as in the follow up of the COPD patients.

CONCLUSION: Although office spirometry significantly improves early detection of COPD in general practice, freely accessible and reliable questionnaires as well as task division within the GP/FM team could help to overcome the barriers to diagnosing and management of COPD.

There is evidence of the fixed combination of Cinnarizine and Dimenhydrinate in the treatment of vertigo?

Sónia Manuela Rodrigues Moreira, Daniela Pedrosa, Duarte Pinto, Catarina Soares, Gilberto Guimarães
Unidade Saúde Familiar Torrão

Background & Aim

Vertigo is one of the most common complaints reported by patients of all ages, with an estimated prevalence in the primary care of 5-7%. It may arise from dysfunction in the peripheral and/or the central vestibular system and can lead to great limitations on patients' ability to meet their daily responsibilities causing frequent falls and other injuries. The initial approach to a patient with vertigo is symptomatic treatment to provide immediate relief.

Drugs from various pharmacologic classes have been used for this purpose.

Our aim was to review the evidence of the efficacy of a fixed low dose combination of cinnarizine and dimenhydrinate in adult patients with central, peripheral or combined central/peripheral vestibular vertigo in comparison with other therapeutics or placebo.

Methods

We searched for guidelines, meta-analysis, reviews and randomized controlled trials (RCT) in the medical literature databases published in English, Portuguese and Spanish between January 2005 and May 2015 using the mesh terms "cinnarizine" AND "dimenhydrinate" AND "vertigo". The Strength of Recommendation Taxonomy (SORT) scale of the American Family Physician was applied to assess the level of evidence (LE).

Results

A total of 11 articles were identified, 5 of which met the selection criteria. All were RCT's with LE 1, that demonstrated that the fixed low-dose combination of cinnarizine and dimenhydrinate are more effective and clinically beneficial in patients with peripheral (3 RCT) or combined central/peripheral vestibular vertigo (2 RCT) in comparison with other therapeutics widely used, as betahistine.

Conclusions

Although the number of studies have demonstrated that cinnarizine and dimenhydrinate are effective in vertigo of various causes, in Portugal is only available a fixed association that is more expensive than other options, such as betahistine. More studies that can show that there is an economic advantage in comparison to other available drugs are required.

¹Department of Family Medicine Medical Faculty Ljubljana, Slovenia

²Primary Health Centre Cerknica, Slovenia

BACKGROUND: IBD is a rare disease, which runs a chronic and relapsing phase for years. Besides physicians in-depth knowledge about the disease the varied clinical picture requires also multidisciplinary and holistic approach, when good and supportive relationship with patient and well-established pathways of communication and cooperation with specialists improve the management of disease and timely prevent relapses. IBD patients' association find the empowered patients better involved in the treatment. Organization of interprofessional symposia for family doctors and other IBD specialists improve understanding of the disease and patient care.

AIM: to demonstrate the successful model of learning about rare diseases in FM.

METHODS: A review of data on the lectures and lecturers, content and presentation techniques used in learning and teaching process.

RESULTS: In 4 years 35 different speakers were carried out 65 lectures related to IBD forms, guidelines and monitoring of treatment. From an average of 163 participants per symposium, 107 was FM doctors or other specialists and 56 were patients. Introductory lectures were devoted to FM marked by stories of patients and their management in FM. Besides lectures, we used a variety of techniques - such as video-story, consilium of specialists, pro-et-contra debate, phone forum, which were well accepted by participants. IBD Association every year presents to doctors a number of activities organized by them for newly diseased and the chronically ill.

DISCUSSION: On annual meeting experts of all specialties and levels meet each other and learn together on rare diseases. In formal and informal meetings they use the opportunity to harmonize views and clarify dilemmas in the field of IBD.

CONCLUSIONS: Learning and teaching all together about rare diseases where the patients become experts for their disease, is a challenge for professionals of different levels and excellent way to improve the management of IBD in family medicine.

Keywords: IBD - chronic disease, rare disease, IBD in family medicine, interprofessional learning and teaching

Monitoring Program of Heart Failure

Gemma Comas Arnau, M Jose Font Alonso, Anna Santeugini Bosch, M Belen Rosa Zambrana, Adriana Ramos Ordoñez, Esther Casanovas Cuquet, A Carolina Berengue González
Institut Català de la Salut, ABS Pineda de Mar, Barcelona, Spain

Summary: The training in self-care of patients with Heart Failure (HF) reduces the decompensations and hospitalization.

INTRODUCTION: In our primary care team (PCT) isn't carried out monitoring of these patients. Therefore, this program is launched, which monitors nursing (MN) of these patients, encouraging self-care of them.

OBJECTIVE: The follow up for each MN of patients with HF promoting self-care of them. Improving the registry of patients with HF. Assess whether having better self implies to a best life's quality.

METHODS: Bimonthly, the nursing program performs was applied monitoring these patients.

Each patient received a booklet with information on his HF, recording sheets blood pressure, weight and schedule visits. In the first visit, MN explain the illness, recommendations and warning signs.

In subsequent visits, evaluates: control blood pressure, weight, New York Heart Association escale (NYHA) signs of overload, adherence to the medication schedule and remember recommendations and warning signs.

Annually, realized the Minnesota scale and European Heart Failure Self-care Behaviour scale.

The doctor evaluates the patient every six months, just before if had decompensation.

The PCT was performed by HF training to professionals.

RESULTS: Before implementing the nursing program performs, wasn't monitored and the patients weren't received training in self-care.

In January 2015, 369 patients was diagnosed with HF in our PCT, 180 of them, had completed the program. The patients with HF was: HF distolic 76% and HF in functional type NYHA II was 54%.

Conclusions:

In our PCT, 48.7% of patients with HF had received training in self-management of their illness.

The professionals who received more training, detected and recorded more patients with HF.

There is a positive trend (better life's quality and the patient self-care), but only significant in the NYHA II group.

Does insulin therapy turn the pink lights on for patients with Diabetes Mellitus?

Emre Yalçıntaş, Yusuf Karayürek, Ufuk Akkaya, Aziz Yılmaz, Dilber Ertaş, Özkan Yusufoglu, Nuh Esad Uyanık, Özer Kelemci, Hakan Demirci

Department of Family Medicine, Sevket Yilmaz Training and Research Hospital, Bursa, Turkey

AIM: Insulin therapy is usually preferred when the other options failed in treatment of Diabetes Mellitus (DM).

Transfer to insulin therapy is generally decided by the results of clinical parameters such as fasting plasma glucose, postprandial glucose and HbA1c. In the present study we aimed to compare success rates of treatment options.

METHODS: Family physicians participated in the study. They were part time trainees in family medicine in Turkey. They checked their computer documents related to patients with DM. Ages, genders, drugs prescribed to the patients at present and HbA1c values (analyzed in last 2 months) were documented.

RESULTS: In the study group, there were 375 patients with DM. Three hundred and eighteen of them were using oral antidiabetic drugs, 32 of them were using insulin and 25 of them were using combination of OAD and insulin. Mean HbA1c values of men (8 ± 2.2) were statistically significantly higher than HbA1c of women (7.5 ± 1.7) ($p=0.026$). The mean HbA1c values of the insulin group (9.6 ± 2.1) was also considerably high compared to the other group (7.3 ± 1.7) ($p=0.000$).

CONCLUSIONS: Starting insulin therapy does not mean a recovery. Insulin users still have a greater blood glucose regulation problem. Follow up of the patients by their family physicians has a critical importance for patients with DM.

The Anticoagulation Challenge in Recurrent Deep Venous Thrombosis

Ana Luísa Borges¹, Miguel Ângelo Almeida²

¹USF Santa Maria Benedita, ACES Oeste Norte, Portugal

²USF Costa Campos, ACES Oeste Sul, Portugal

Deep venous thrombosis (DVT) has a high incidence worldwide, associated with high morbi/mortality rates. The core of this pathology is the Virchow triad (endothelial lesion, hypercoagulability, venous stasis). Standard treatment is 3 months of anticoagulation with LMWH and/or oral anticoagulants; however an indefinite treatment option may be valid in situations with persistent risk factors.

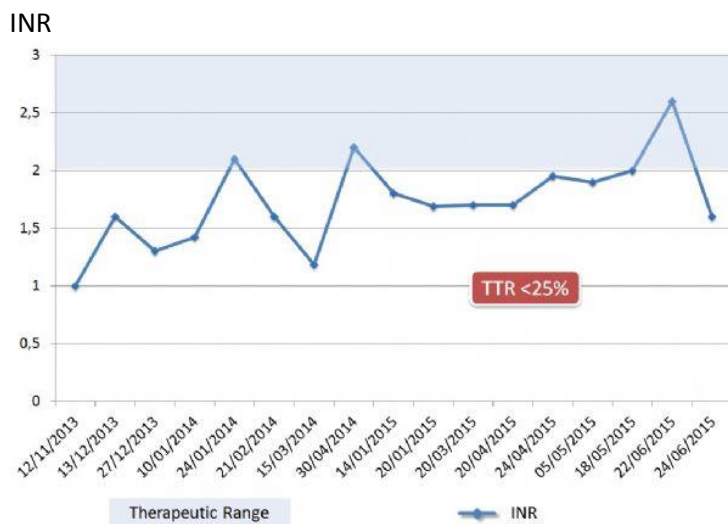

A 50-year-old Caucasian woman, non-smoker, autonomous, with past history of chronic venous insufficiency (CVI), with almost 30 years of evolution and multiple episodes of DVT, treated with subcutaneous enoxaparin, under warfarin treatment since November 2013. She had 2 vascular interventions (bilateral and left saphenectomy). Her family background includes CVI and multiple cerebrovascular accidents in young age. On April 2015, she presented with worsening lower limb pain, swelling and tiredness. On examination, there were

multiple varicose veins bilaterally, no edemas or tenderness on palpation in the popliteal fosse behind the knee. The lower extremity echo-doppler ultrasound demonstrated sequelae and signs of past DVT. Concerning her anticoagulation records, she had a labile INR (TTR<20%) – HASBLED=1.

It is known that an indefinite treatment reduces the risk for recurrent VTE by about 90%, but this benefit is partially offset by a 1% or higher annual risk of major bleeding. Considering our patient history of recurrent DVT without defined cause, it would be beneficial to choose a long treatment option with periodic assessments. Attending to her TTR, a change to a new oral anticoagulant would be an option; in fact several studies indicate that NOACs are both effective and safe in terms of prevention of DVT. Moreover, concerning to her family background, it would be interesting to persue further studies in order to exclude prothrombotic pathologies.

Suitability of metformin in the treatment of type 2 diabetes mellitus

João Rocha Moutinho, Diana Almeida Ferreira

UCSP Mealhada, Portugal

Background & AIM: treatment and glycemic control in patients with type 2 diabetes mellitus are important to delay the appearance and evolution of micro and macrovascular complications. In the treatment of type 2 diabetes, metformin is the drug of choice, but its use should be limited in case of chronic kidney disease. The objective of this study is to assess renal function and glycemic control of type 2 diabetic patients treated with metformin.

METHOD: cross-sectional study. Data of all users in a Primary Health Care Unit with ICPC-2 codification of type 2 diabetes mellitus being treated with metformin. The data collected included sex, age, estimated glomerular filtration rate (eGFR), presence or absence of microalbuminuria, systolic and diastolic blood pressure values.

RESULTS: 137 patients with a diagnosis of type 2 diabetes mellitus were identified, 100 of them are actually to pharmacological treatment with metformin, 51♂ and 49♀. Metformin exclusive is being used by 57 patients, metformin in combination with another oral antidiabetic on 34 patients and 9 in combination with insulin. Age 65,2±11,7 years old. 91% of then presents a eGFR≥ 60ml/min but 3 patients have eGFR less than 30ml/min and 6 have eGFR between 30-60ml/min.

CONCLUSIONS: In 3 patients metformin would be contraindicated because of an eGFR lower than 30ml/min so should be discontinued at increased risk of lactic acidosis. 6 patients have eGFR between 30 and 60ml/min and should therefore be studied adverse effects and should be considered substitute another oral anti-diabetic.

Keywords: Metformin,Diabetes mellitus,Chronic kidney disease

Results of Smoking Cessation Program

Ayşe Semra Demir Akca¹, Fatih Akca², Murat Altuntaş², Pınar Alagöz²

¹Department of Family Medicine, Bülent Ecevit University Faculty of Medicine, Zonguldak, Turkey

²Uzun Mehmet Chest and Occupation Hospital Zonguldak, Turkey

The aim of this study was to evaluate the demographic characteristics and the success rates of the smokers who had completed one year follow-up in our smoking cessation clinic. A full medical history was taken and Fagerström Nicotine Dependency Test was performed at the first appointment. The subjects were given counseling regarding the hazards of smoking and a booklet for motivation was provided.

RESULT: Patients received different treatments including behavioral therapy (BT; 27.4%), BT+NRT (8.2%), BT+bupropion (23%), BT+varenicline (50.2%) and BT+bupropion+NRT (4.6%).

CONCLUSION: The process of smoking cessation should be considered individually for each case and it is a difficult process. In this process, adequate behavioral therapy and appropriate pharmacological treatment for individuals in sufficient time will increase the success rate

Corelation of apnea hypoapnea index concerned with body mass index in patients with obstructive sleep apnea syndrome

Ayşe Semra Demir Akca¹, Fatih Akca², Pınar Alagöz²

¹Department of Family medicine, Bülent ecevit üniversity, zonguldak, turkey

²Uzun Mehmet Chest and Occupation Hospital Zonguldak, Turkey

OBJECTIVES: Respiratory disorders during sleep is a common public health problem. OSAS consists of the vast majority of this group of disorders. PSG is the golden standart diagnostic technique. However PSG is an expensive, time consuming, special team requiring test and the psg laboratory quantity is very restricted. BMI is important parameters to differantiate the cases who are going to be referred to PSG. In our study the contribution of BMI has been evaluated in the OSAS diagnosis.

RESULTS: The study is in process. Results will be discussed at the congress.

A very resistant diabetes

Isabel Solha, Jonathan Santos

usf terras de souza, aces tamega 2, paredes, porto, portugal

Background and AIM: According to WHO, global prevalence of diabetes Diabetes Mellitus was estimated to be 9% among adults in 2014, projected to be the 7th leading cause of death in 2030. Disease management and control of cardiovascular risk factors prevents early onset of micro a macrovascular complications. When managing seems impossible, this case aims to remind practitioners the importance of perseverance.

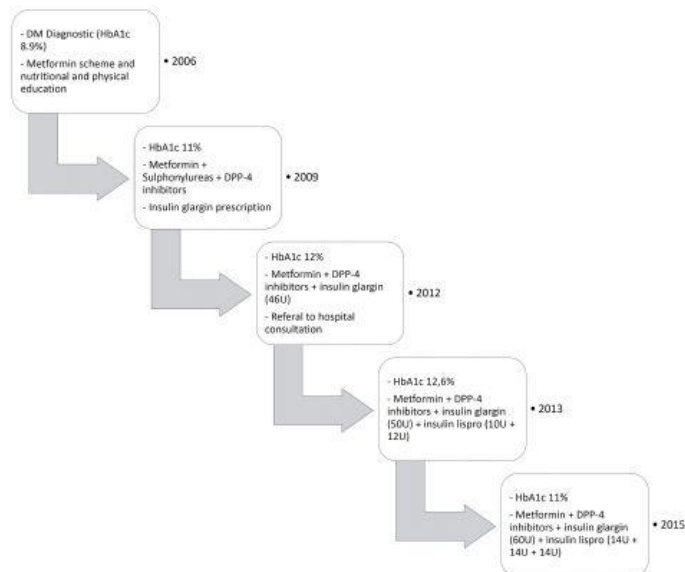

Case description: Female, 61, caucasian, married, with hypertension and obesity (BMI = 42 kg/cm²) who in 2006 was diagnosed with DM. Eating and physical activity education were made and oral antidiabetic drugs prescribed. Glycated hemoglobin (HbA1c), after a slight improvement, returned to baseline. The combination therapies recommended were implemented without success and HbA1c raised to 11%. An insulin regimen was instituted with consecutive dosage increases, that did not improve glycemic control, so it was referenced to an hospital consultation. She is currently treated with metformin (850mg 2id), insulin lispro (14U + 14U + 14U) and insulin

glargine (60U). The injectable anti-diabetic wasn't tolerated by the patient, keeping HbA1c values up far above the target therapeutic (11%). However, the patient developed other co-morbidities, such as dyslipidemia, multiple osteoarthroses, anxious disorder, peripheral arterial disease, diabetic retinopathy and moderate aortic stenosis, being accompanied by a multidisciplinary team.

CONCLUSIONS: Despite multiple medical approaches, different specialists and teachings, it seems impossible to achieve a suitable metabolic control for this patient with multiple comorbidities. The role of the Family Doctor is crucial not only in continuing therapeutic education, but also reminding the importance of healthy life style measures and promoting therapeutic adherence. Taking care of these patients is more effective when primary health care articulate with hospital's multidisciplinary teams.

Alzheimer's disease – Criteria for Diagnosis and Therapeutics The role of Family Physician

Maria Teresa Pereira Rodrigues Gaudêncio Silva, João Pedro Tomaz
ACES Sintra

INTRODUCTION: Alzheimer's disease (AD) ranks among primary dementia with insidious evolution, progressive and irreversible, characterised by increasing memory loss and cognitive decline.

Estimates indicate 90,000 portuguese have AD. Mainly affecting female individuals over 65 years old.

PURPOSE: To identify signs and symptoms of AD and updated evaluation criteria regarding diagnostic and therapy aiming to assess Family Physician degree of involvement in such evaluation.

Applied METHOD: A systematic research has been conducted on UpToDate® and PubMed/MEDLINE® databases looking for articles in Portuguese and English languages, published over the last decade, considering: review articles, meta-analysis and random clinical trials. MeSH terms used to the search: "dementia", "Alzheimer disease". The articles were selected according to the previous purpose.

Revision: Alzheimer's disease presents itself over 3 stages of evolution each showing specific characteristics. Strong genetic influence is related to AD with recently discovered biomarkers providing a key towards early diagnosis. Nevertheless, tests (e.g. Mini-Mental), scales (e.g. Blessed), questionnaires (e.g. FAQ, IQCODE) and criteria for diagnosis still hold the main role in diagnosing and prognosing AD.

DISCUSSION: Alzheimer's disease is an incapacitating illness for which the main symptom is memory loss which is by itself a frequent motivation for appointment with a Family Physician / GP. Hence, clinical practice should aim early diagnosis of AD.

It can be achieved by means of anamneses' collection directed towards both patient and caregiver and by applying those cognitive tests relevant within the context of Portuguese population. Therapeutics is accomplished

via early intervention by a multidisciplinary team.

The role of the Family Physician is utmost important at assessment, diagnosis and therapeutics stages of the process as well as by supporting and counselling patients and caregivers throughout the process.

Evaluation of Obese Patients Who Admitted to Outpatient Clinic of Mersin University Faculty of Medicine Department of Family Medicine

Esra Akkoca, Damla Demiray, Yücel Uysal, Ertan Mert

Department of Family Medicine, Mersin University, Mersin, Turkey

Background and Aim

Aim of the study is to evaluate obese patients who admitted to outpatient clinic of family medicine department according to the diagnoses of hypertension, diabetes, hyperlipidemia and thyroid-stimulating hormone abnormality.

Method

Medical records of the obese patients who admitted to outpatient clinic to lose weight have been evaluated retrospectively. 199 obese patients have been selected randomly among the patients who admitted in twelve months period between January 2012 and January 2013. These patients had no complaint except high body weight. Gender, blood pressure, blood glucose level, lipid levels, body mass index, waist circumference, thyroid-stimulating hormone level and follow up duration data of the patients were recorded, analyzed and evaluated.

Results

The results showed that mean follow up time time was $7,85 \pm 9,7$ months (range 1-42), mean age of patients was $42,89 \pm 14,6$ (range 13-75). Evaluation of data showed these abnormalities in patients; high blood pressure in 82 patients (41,2%), high blood glucose level in 77 patients (38,7%), high lipid level in 126 patients (63,3%), high thyroid-stimulating hormone level in 19 patients (9,5%).

Conclusion

The study showed that prevalence of certain diseases are very high in obese patients. As obesity is an important risk factor for many diseases obese patients should be examined and evaluated carefully although they had no complaint or apparent findings.

Platelet rich plasma (PRP) is a novel therapeutic tool with the grate theoretic and experimental potential in osteoarthritis (OA) treatment

Liudmyla Khimion¹, Liudmyla Smolina², Svetlana Danyliuk³

¹L. Khimion, National Medical Academy of Postgraduate Education named after P.L. Shupyk, Kyiv, Ukraine

²L. Smolina, National Medical Academy of Postgraduate Education named after P.L. Shupyk, Kyiv, Ukraine

³S. Danyliuk, National Medical Academy of Postgraduate Education named after P.L. Shupyk, Kyiv, Ukraine

Methods. The study was conducted in 2 gr. of patients with diagnosed knee OA. 28 patients (9♂ (30.8%) and 19♀ (69.2%), mean age $44,7 \pm 1,2$ years were divided on 2 gr. Gr1 included 14 patients who consented to receive standard OA treatment and 3 intra-articular injections of PRP (total volume 12 ml, mean platelets number $860,2 \pm 32,1 \times 10^9 / \mu\text{l}$) weekly; gr2 consisted of 14 patients with the same diagnosis-received only standard OA treatment. The CRP-level, WOMAC scale, Lequesne index was analyzed before treatment and 1, 3, 6 months after course of treatment in both groups.

Results. CRP level was modestly abnormal in the 42,9% patients of gr1 and 35,7% patients of gr2; during the

treatment period CRP got to normal in all patients, but during the follow-up period, after 3 and 6 months of treatment in the study group it was significantly ↓ ($7,34 \pm 0,52$) and ($4,34 \pm 0,22$) mg/L, than in the control group ($9,56 \pm 0,67$) and ($6,92 \pm 0,57$) mg/L ($p < 0,005$); in addition in 3 patients of gr2 CRP level had increased again after 3 months which was the sign of OA exacerbation; in gr1 there were no OA exacerbations during 6 months of follow-up. At month 6 functional status of the patients in gr1 improved by 23% in stiffness (at the beginning of the study it was $3,8 \pm 1,0$) which had significant difference with patients of control group ($3,6 \pm 0,1$) - at the beginning of the study and ($2,4 \pm 0,1$) in 6 month after treatment. Pain during movement and after passing the distance decreased after treatment by 37.8% in gr1; pain and discomfort when climbing and descending the stairs decreased by 38.6% (these indicators in gr1 at the beginning of the study were $10,9 \pm 1,3$) (in gr2 - $10,2 \pm 0,9$) and in 6 month after treatment - $2,3 \pm 0,3$ in gr1 and $4,5 \pm 0,3$ in gr2 ($p < 0,05$). At the end of follow up period patients functional activity increased by 44.1% in gr1 which was ↑ then positive changes in gr2 and was accompanied by a significant reduction of restrictions in daily activities.

Conclusion. The course of 3 intra-articular injections added to the standard treatment of knee OA improves functional activity, reduces pain and probably can prolong remission in patients with the early stages of disease.

⁷Department of Internal Medicine, Kartal Training and Research Hospital

⁸Division of Endocrinology and Diabetes, Internal Medicine and Family Medicine Departments, Kartal Training and Research Hospital

Background and AIM: Hypogonadism is a clinical condition comprising both symptoms and biochemical evidence of testosterone deficiency. It has been reported that testosterone levels are lower in diabetic men compared with nondiabetic subjects. The aim of our study was to assess the prevalence of hypogonadism, based on both symptoms and biochemical available measures of testosterone deficiency in men with type 2 diabetes and compare with control group.

Research Design and METHOD: A cross sectional study was carried out in type 2 patients who attended the outpatient clinic of Diabetes Kartal Training and Research hospital. Between the 1th July and 15th July 2012, 65 consecutive patients were included to the study. Control group is created by age matched 40 non diabetic patients. Blood pressure, waist circumference, height, weight and testosterone levels were measured. Body Mass Index (BMI) was calculated. Bioavailable testosterone and free testosterone levels were calculated by using the levels of albumin, total testosterone and sex hormone binding protein. The Aging Males' Symptoms scale (AMS) was used to measure symptoms of hypogonadism.

RESULTS: Diabetic patients and control group's mean age was respectively 52.2 ± 5.0 and 50.8 ± 6.0 year, mean BMI 27.8 ± 2.9 and 27.9 ± 3.9 kg/m² and mean waist circumference 100.8 ± 7.3 and 97.9 ± 17.5 cm. Men with type 2 diabetes had significantly lower total testosterone and SGBH than control group. According to chemical hypogonadism based on total, bioavailable and calculated testosterone levels, there were no statistically difference between groups. Men with type 2 diabetes had significantly higher severe and moderate complaints of hypogonadism than control group. In diabetic group waist circumference, BMI and in control group waist circumference were negatively correlated with testosterone levels.

CONCLUSION: This study demonstrates that men with type 2 diabetes had significantly lower total testosterone but not significantly higher biochemical hypogonadism than control group.

Pancytopenia due to a lack of vitamin B12 in chronic atrophic gastritis secondary to alkaline reflux in developing common; Case Reports

Türkan Paşalı Kilit¹, Süleyman Coşgun², Yasemin Korkut³, Serdar Üçgün¹

¹Department of internal Medicine, Dumlupınar University, Kütahya, Turkey

²Department of Gastroenterology, Dumlupınar University, Kütahya, Turkey

³Department of Family Medicine, Dumlupınar University, Kütahya, Turkey

OBJECTIVE: Chronic alkaline reflux gastritis is a rare cause of chronic atrophic gastritis. Chronic atrophic gastritis reduces plasma vitamin B12 and folic acid levels and increase homocysteine level. Vitamin B12 deficiency is a common cause of macrocytic anemia and pancytopenia.

CASE: Seventy-five-year-old male was admitted to the internal medicine department with complaints of numbness in hands and anorexia. In his laboratory test; ALT: 55U/l, AST: 163 U/l, indirect bilirubin: 1.59 mg/dl, direct bilirubin: 0.79 mg/dl, WBC: 4200/mm³, hemoglobin: 7.3 g/dl, hematocrit: 28%, MCV: 127 fl and PLT: 51.000/mm³. Increases in AST, MCV and indirect bilirubin levels were thought to be due to vitamin B12 deficiency. A Vitamin B12 level was 12.44 pg/ml. Erosive antral gastritis and alkaline reflux gastritis were found in upper gastrointestinal endoscopy. Chronic atrophic gastritis was detected in gastric biopsy. Helicobacter Pylori was negative in biopsy. An antiparietal cell antibody was negative (1/20). Vitamin B12 deficiency associated with atrophic gastritis caused by alkaline reflux was considered and parenteral vitamin B12 was given to the patient. Test results following three months were as follows: WBC: 6700/mm³, hemoglobin: 10.2 g/dl, PLT: 122.000/mm³, MCV: 93 fl, AST: 28 U/l, ALT: 15U/l, direct bilirubin: 0.55 mg/dl, indirect bilirubin: 0.9 mg/dl. Complaints of patient were improved.

RESULT: In patients with pancytopenia, vitamin B12 deficiency should be considered if AST, MCV and indirect bilirubin levels were elevated and neurological symptoms exist. Consequently; evaluation of the peripheral blood smear as the first laboratory test is extremely important in patients with pancytopenia that found in CBC made for any reason. Further testing for etiologic research should be planned according to the results of peripheral blood smear. Because of the increased risk of developing gastric cancer in patients with atrophic gastritis compared to the normal population, these patients should be followed by endoscopy at regular intervals.

Keywords: Atrophic gastritis, vitamin B12 deficiency, pancytopenia.

P-0233

Is it possible correlation between anthropometric measurements with microalbuminuria in the general population?

Türkan Paşalı Kilit¹, Celal Kilit², Yasemin Korkut³

¹Department of Internal Medicine, Dumlupınar University, Kütahya, Turkey

²Department of Cardiology, Dumlupınar University, Kütahya, Turkey

³Department of Family Medicine, Dumlupınar University, Kütahya, Turkey

OBJECTIVE: The most commonly used parameters in anthropometric measurements are waist circumference, hip circumference, waist-hip ratio and the body mass indexes (BMI). Cardiovascular risk is known to increase with waist circumference increase. BMI of 30 or greater is considered obese. The presence of microalbuminuria in spot urine test is an early indicator of target organ damage. Microalbuminuria has been shown to be an important risk factor for atherosclerosis and cardiovascular disease in many studies. Likewise, increase in waist circumference is associated with increased visceral adiposity and increased risk of cardiovascular disease. In this study, we investigated whether there is a relationship between microalbuminuria and anthropometric measurements in the general population.

METHOD: Anthropometric measurements of 206 patients admitted to our hospital internal medicine outpatient clinic were made. Patients with diseases that can cause microalbuminuria such as chronic renal failure or nephrotic syndrome were excluded from the study. Patients with diabetes and hypertension were included in this study with subjects completely healthy. Microalbuminuria levels of patients were measured in the spot urine. The association between microalbuminuria levels and height, weight, BMI, waist circumference, hip circumference and waist-to-hip ratio were investigated.

RESULTS: The mean age of patients was 45 (18-72 years). BMI was between 18 and 53 kg/m². There was no significant correlation between anthropometric measurements with microalbuminuria values.

RESULTS: The incidence of microalbuminuria increases with age in obese patients. Obesity accompanied by hypertension and diabetes Mellitus, increases the risk of microalbuminuria. In the evaluation performed without exclusion of diseases which may cause microalbuminuria such as hypertension and diabetes, a significant correlation has not been determined between anthropometric measurements and microalbuminuria level. Increased risk of microalbuminuria in obesity seems to be dependent on factors such as hypertension and diabetes associated with obesity.

Keywords: Anthropometric measurements, microalbuminuria, body mass index

Isolated Hemihypertrophy: Case Report

Ahmet Ünal¹, Mediha Akcan², Refik Emre Çeçen²

¹Department of Family Medicine, Adnan Menderes University, Aydın, Turkey

²Department of Pediatric Hematology and Oncology, Adnan Menderes University, Aydın, Turkey

INTRODUCTION

Isolated Hemihypertrophy(IHH) increased risk of embryonal cancer that watch in childhood,especially Wilms tumor. Although name is hyperplasia,it used as hypertrophy.Limbs,body,face or entire body is characterized by asymmetric growth.The most common syndrome accompanied by Beckwith-Wiedemann syndrome,also can be seen as part of the Proteus syndrome,Russell-Silver syndrome,neurofibromatosis type I and Klippel-Trenaunay-Weber syndrome.The incidence is between 1:13000-1:86000 live births.

CASE REPORT

10 month old baby girl,her left half of the body was larger than the right.Her complaint had since birth.It was learned that following the 35-week gestation period she was born by cesarean section 1500 grams birth weight.On physical examination,weight 7500 grams (3-10 percentile),height 70 cm (25-50 percentile),head circumference of 44 cm (25-50 percentile).Her left upper and lower extremities was hypertrophic according to right extremities.Left forearm circumference 16.5 cm (the widest place),right forearm circumference 14 cm (the widest place),left leg circumference 23 cm (the widest place),right leg circumference at 22 cm (the widest place) were measured.She don't have dysmorphic facial features,macroglossia,abdominal wall defects,vascular abnormalities and cutaneous manifestations.There was no organomegaly.Laboratory examination revealed kidney function tests,liver function tests,thyroid function tests and alpha-fetoprotein was normal.There was no evidence of a complete blood count except for anemia.Hypochromia detected in peripheral blood smear made from the patient were consistent with iron deficiency anemia.Oral iron therapy was started.Abdominal and renal ultrasound examination was normal.The patient was considered isolated hemihypertrophy and she was transferred to the pediatric oncology.

CONCLUSION

IHH is important,because Wilms tumor,hepatoblastoma,adrenal cortical carcinoma, neuroblastoma,pheochromocytoma,rhabdomyosarcoma is seen in IHH more common compared to normal population. In such cases, a complete physical examination, a good story and laboratory examining, you will be able to diagnosis and follow up. They followed by pediatric oncology up to 7 years to be is important for early diagnosis and treatment. The cases detected hemihypertrophy should be directed to oncology children immediately.

Evaluation of chronic disease, and demographic characteristics of patients who admitted for periodic health examination

Elif Erdoğan Cenik¹, Rabia Dane Kocasaç¹, Mahcube Çubukçu², Mustafa Kürşat Şahin³

¹Department of Family Medicine, Medical Faculty, Ondokuz Mayıs University, Samsun, Turkey

²Department of Family Medicine, Samsun Education and Research Hospital, Samsun, Turkey

³Canik Community Health Center, Samsun, Turkey

AIM: The purpose of the periodic health examination is to evaluate health status, screen for risk factors and disease, and provide preventive counseling interventions in an age-appropriate manner. The goal of screening and evaluation is to prevent the onset of disease or the worsening of an existing disease. In this study, the chronic disease, and demographic characteristics of patients who admitted for periodic health Examination was investigated.

METHODS: The following study was performed on 185 patients who admitted to Samsun Education and Research Hospital Family Medicine outpatient polyclinic January 2012 to December 2013. Data were analyzed using SPSS

22.0 package program. In the analysis, frequency and percentage from descriptive criteria were used.
RESULTS: There were 100 (54%) female and 85 (46%) male patients. Patients average age was $45,63 \pm 13,9$ (range: 14-80). Four of the five patients were married. Nearly half of patients came from urban. One to eight patient admitted in 2013. Five most common disease was hypertension (%16,2 n=30), diabetes (%11,9 n=22), respiratory disease (%8,6 n=16), anemia (%8,1 n=15), psychiatric disease (%7,5 n=14). Hypertension was commonly observed in women, diabetes was commonly observed in men.

CONCLUSION: Women admitted to periodic health examination more than men. Patients age was generally at middle age. Married patient significantly had more chronic disease than others ($P=0.008$). Most participants didn't have any disease. Most common diseases are hypertension and diabetes. We planned to focus more on patient needs and improving the quality of care.

Effect of the depression and anxiety status of cancer patients on their caregivers

Elif Altunbaş Ateş¹, Emine Canyılmaz², Turan Set¹, Nahide Gökçe Çakır¹, Ceyhun Yurtsever¹, Adnan Yöney²

¹Karadeniz Technical University Medical Faculty, Department of Family Medicine, Trabzon, Turkey

²Karadeniz Technical University Medical Faculty, Department of Radiation Oncology, Trabzon, Turkey

BACKGROUND & AIM: Today, cancer became a chronic disease that requires long-term treatment and care at home that affects the whole family. In our study, we aimed to investigate the impact of the depression and anxiety status of cancer patients on family members responsible to provide care.

METHODS: This study was conducted as a cross-sectional study between November 2014 and May 2015. A questionnaire containing demographics and Hospital Anxiety and Depression Scale (HADS) was applied to 76 patients who came to receive radiotherapy and their caregivers at Karadeniz Technical University Medical Faculty Radiation Oncology Unit using face-to-face interview.

RESULTS: The mean age of patients was 55.2 ± 14.5 , while the average age was 42.5 ± 13.2 at caregivers. Female rate of patients was 57.9% and 52.6% of caregivers were women. Anxiety and depression scores were significantly higher than men in female caregivers ($p=0.001$, $p=0.028$ respectively). Depression levels of patients were positively correlated with anxiety levels of the caregivers ($r=0.308$, $p=0.008$). There was no correlation between anxiety levels of patients and caregivers anxiety levels and also between caregiver's depression and the patient's depression and anxiety levels.

CONCLUSION: It has been shown that patient's depression levels affect caregiver's anxiety in our study. To provide optimal health care of a patient, considering mental health status of caregivers will be useful.

Positivity rates of thyroid antibodies (anti-TPO and anti-TG) in patients with thyroid disorder

Murat Atmaca, Zeynep Tuzcular Vural, Işık Gönenç, Merve Esen Arslan

Haydarpaşa Numune Training And Research Hospital Family Medicine Department

Background & AIM: Thyroid disorders are common endocrinopathies frequently encountered in primary health care settings. Otoimmune thyroiditis is a group of disorders causing thyroidal inflammation. Antibodies that attack the thyroid are what causes most types of thyroiditis. Anti-thyroid peroxidase (anti-TPO) antibodies are the most common thyroid autoantibody. Thyroglobulin antibodies (anti-TG) are specific for thyroglobulin. In this study, we aimed to retrospectively evaluate positivity rates of thyroid antibodies in patients presenting to our outpatient clinics with thyroid disorder.

METHOD: In this study, 473 patients examined during a 12 month period in the Haydarpaşa Numune Training and

Research Hospital Family Medicine Department who had both antibody results and had at least one positive result were evaluated retrospectively. Results higher than the normal range of the tests were considered as a 'positive' result. Patients whose antibodies were not evaluated simultaneously were excluded. In cases where antibodies were measured more than once, the most recent results were evaluated.

RESULTS: A total of 473 patients: 412 female (%87) and 61 male (%13) were evaluated for antibody positivity. Fifty patients had only anti-TPO (10,57%) and 106 patients had only anti-TG 106 (22,41%) positivity. In 317 patients (%67,02), both antibodies were positive.

CONCLUSIONS: Endocrinology guidelines state that in most patients with anti-TPO positivity, anti-TG is also positive; therefore it is not cost effective to measure anti-TG antibodies. It is claimed that cases which are anti-TPO negative, but anti-TG positive constitute approximately only 1-5% of autoimmune thyroiditis patients. Our results show that, in our study sample, 22,41% had only anti-TG positivity. This result is much higher than expected. We believe that antibody rates may differ for the Turkish population. Our results suggest that looking at only anti-TPO titrations for diagnosing autoimmune thyroiditis, may cause some patients to be left undiagnosed. Widespread research is necessary for more definite results.

A Silent Danger: Awareness in Coronary Artery Disease

Suat Bıçak, Ayşe Semra Demir Akça, Tuğba Beyazççek, Yunus Müdüroğlu
Bülent Ecevit University Department of Family Practice, Zonguldak

Chronic ischemic heart disease is the main reason for myocardial ischemia. In epicardial coronary arteries, the level of mechanical obstruction generated by atheromatous plaque in vascular lumen is the most important determinant of prognosis. An obstruction at a rate of 50%-70% is needed for the patient to give symptoms. In symptomatic patients, typical angina which may spread over the neck, jaw, left arm and hand could be seen in a postprandial retrosternal, pressure-clamp and style due to exertion and emotional stress. The present case is about subjecting a hypertensive patient to advanced examination and diagnosis of ischemic heart disease considering positive immediate family history and high LDL level, despite the fact that the patient has no symptoms which may suggest ischemic heart disease.

The 50-year old male patient who has no chronic disease other than hypertension applied to the Family Medicine Polyclinic of Bülent Ecevit University for advanced examination by reason of the fact that his immediate relatives (father 57 MI, uncle 43 MI) died of coronary artery disease. Physical examination and EKG results of the patient were found normal and the patient was subjected to advanced examination due to positive family history. After the MPS, reversible perfusion defect was found at mid-basal level in the inferolateral region and the patient was subjected to coronary angiography

DISCUSSION

Coronary artery disease may clinically manifest itself in the form of silent ischemia, angina pectoris, acute coronary syndrome and sudden death. For protection against this disease, positive changes should be made in recoverable risk factors (hypercholesterolemia, physical activity, smoking, smoking...). In terms of recoverable risk factors, our patient had hypercholesterolemia but no others. As is known, family practice is a discipline that primarily evaluates both individual and society under the protective treatment.

Keywords: coronary artery disease, angina pectoris, hypercholesterolemia

Validity and Reliability of Morisky Medication Adherence Scale in Patients with Hyperlipidemia

Rana Gündoğan, Kübra Uyar, Nilgün Özçakar, Mehtap Kartal
Department of Family Medicine, Dokuz Eylül University, Izmir, Turkey

BACKGROUND&AIM: Although benefits of cholesterol lowering treatment on prevention and treatment of the cardiovascular diseases documented, potential benefits of the treatment depends on drug adherence. In people with medium/high cardiovascular disease risk, treatment nonadherence deprive individuals benefits of prevention and causes serious increased costs in health systems as a result of increased preventable cardiovascular events.

Assessing adherence for primary care and in chronicle diseases, Morisky Medication Adherence Scale-8 (MMAS-8) is preferred as an easy, cheap method. Our aim was to evaluate the validity and reliability of the Turkish version of MMAS-8 in hyperlipidemic patients.

METHODS: In our methodological study, Turkish form of MMAS-8 is used, consisting 8 questions related to drug use, with necessary allows. Totally 194 participants who applied a family medicine center, agreeing participate study and was prescribed cholesterol lowering drugs in last year administered questionnaires containing socio-demographic characteristics, MMAS-8 with face to face method.

SPSS 15.0 is used for analysis and significance is $p < 0.05$. Cronbach 's alpha coefficient was calculated for internal consistency. Kaiser-Mayer-Olkin (KMO) and factor analysis was performed.

RESULTS: The mean age was 65.23 ± 9.43 , 59.3% were women ($n=115$), 63.4% were married ($n= 123$), 58.8% was retired. By MMAS-8 53.1% ($n=103$) were consistent mid-to-high.

The average LDL-cholesterol level was 117.8 mg/dL in compatible group, 167.6 mg/dl in incompatible group, difference was significant ($p < 0.05$).

The last 10 days of drug use rate of the patients (medication possession ratio-MPR), MPR mean was 9.66 in compatible group, 4.09 in incompatible group, difference was significant ($p < 0.05$). Cronbach's alpha reliability coefficient of the scale was 0.738. Factor analysis for construct validity KMO value was 0.68. Load factor of all questions is above 0.40, total variance explained by the scale was 69.689%.

CONCLUSION:

Turkish version of MMAS-8 was found to be reliable, valid clinical instrument in primary care for evaluation of hyperlipidemic drug use.

Triggers, therapeutic attitudes and degree of disability of patients with migraine in primary Care

Susana Elizabeth Riesgo, Brenda Elizabeth Riesgo Escudero, M Dolores Moriano García, Rosa M. Viñas Vidal, M. Mar Forés Chacori, Marta Bandrés Minguenza, Ramón J. Gonzalez Alonso, Isabel Zamora Casas, Marielle Fernndez Fernandez, Max Encarnación Minaya
Institute Catalán de la Salud - Barcelona- Spain

OBJECTIVE: To identify the triggers, the degree of disability, and therapeutic approaches adopted in patients with migraine at an urban CAP (primary care center).

MATERIAL-METHODS: Descriptive cross-sectional study. Randomly recruited 206 patients between 15 and 65 years of age that were diagnosed with migraine according to International Headache Society. Patiens registered in the database (E-CAP) of our health center located in the urban area of Barcelona (Spain). 15 patients were excluded for various reasons.

VARIABLES: sex, age, pain location, age of onset, duration, type, intensity, crisis frequency, triggers, treatment, degree of disability by MIDAS (Migraine dissability Assessment Scale) questionnaire

Exclusion criteria: age < 15 or > 65 years, other types of headache, and refusal to participate.

Exploiting data with SPSS 18.0

RESULTS: Of all patients (n=206),191 were included and 15 excluded because of refusal to participate (n=2), and other types of headache (n=13). Female predominance was observed. (82.2%). The average age of first seizure was 44.4 years (DE12.65) with a average duration of 2.6 days (SD 2.46). 69.6% of patients reported throbbing quality and 79% predominantly unilateral location.

61.2% of patients had pain of severe intensity.44% performed preventive treatment (p-value:0.037) and 50.4% symptomatic treatment with triptans (p-value:0.078). The triggers were associated to stress by 31.1%. 38.7% of patients received preventive treatment, of which 47.1% were male. The most commonly used drugs were:Nadolol (5.6%),flunarizine (2.8%) and topiramate (1.4%).In Symptomatic treatment the most commonly used drugs were NSAIDs (87.4%), followed by paracetamol (79.0%) and triptans (43.9%). According to the MIDAS scale,68.5% of patients had little or no disability.

CONCLUSION: Severe disability was lower than expected. Given the large proportion of patients with pain of severe intensity,we must strength preventive and symptomatic treatment with triptans.

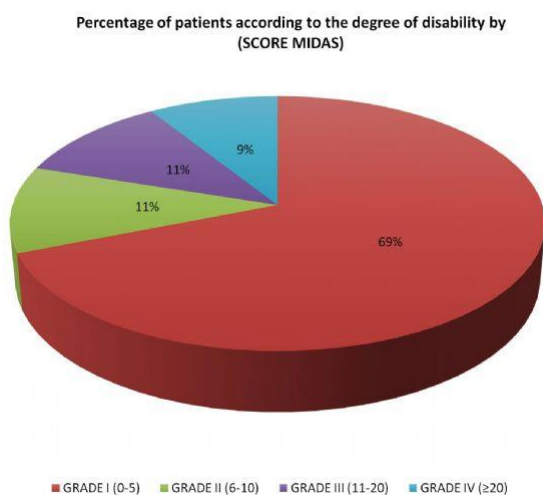

The migraine characteristics of our area are consistent with other published studies

Keywords: Migraine/MIDAS scale/Primary Care

Percentage of patients who received preventive treatment (by gender)

Study of the degree of agreement in referrals for surgery from primary medical care

Alvaro Perez Martin¹, Maria Jose Agueros Fernandez², Victor Ovejero Gomez⁴, Jose Ramon Lopez Lanza⁵, Monserrat Gago Bustamante², Alfredo Avellaneda Fernandez³, Cecilia Traspuesto Pascual¹, Isabel Muñoz Franco¹, Patricia Noemi Aguilera Samaniego¹, Maria Antonia Gandara Revuelta², Luis Rioja Zarrabeitia², Maria Angeles Pereda Garcia²

¹Primary Health Center Centro. Santander. Spain

²Primary Health Center Zapaton. Torrelavega. Spain

³Primary Health Center Los Carmenes. Madrid. Spain

⁴Sierrallana Hospital. Torrelavega. Spain

⁵Primary Health Center Alisal. Santander. Spain

Background&AIM: To analyse the characteristics of referrals for surgery from primary medical care, and the degree of agreement on the diagnoses..

METHOD: Analysis of patients referred to general surgery from an urban primary medical care centre over 2012, comparing the quality of the referral note, clinical assistance, and the diagnoses made at each level. Statistical analysis: averages were used for variables and percentages for qualitative elements and the Kappa index was used to assess the degree of agreement.

RESULTS: 177 referrals were made. The average age was 56(SD17.3), mainly male (50.3%). The main reasons for referral were inguinal hernia (21.5%), varicose veins in lower limbs (14.7%), skin cysts (10.7%) and hemorrhoids (8.5%). 59.3% were referred after the first consultation, with 3.4% having some kind of diagnosis test carried out, mainly ultrasound scans(66.7%). 17.5% were prescribed a treatment before referral(venotonics 43.3%). In general surgery, 38.4% received surgical intervention and 51.2% received some kind of treatment (local dressing (65.6%)). In 52% of cases in primary care centres the pathology was well described; at hospital level this figure was 50.3%, and the medical records were later completed in 45.2% of the cases. The Kappa index of diagnosis agreement between levels was 0.61, which is considered to be good.

CONCLUSIONS: There is a good degree of agreement between levels, which means there is knowledge regarding the pathologies. What needs to be highlighted is the poor description of the pathology on the referral note, from primary medical care as well as in the response, and the lack of information later entered onto the medical records. Diagnosis tests or prior treatments in primary medical care are seldom used. Almost half of the referrals received surgical intervention. It is necessary to become aware at both levels that the information has to be correctly registered onto the medical records.

Doctor, my nail is green !

Madalina Beatrice Morna

CAP Viladecans, Catalan Institute of Health, Barcelona, Spain

BACKGROUND: we present the clinical case of a patient 64 years old, housekeeper, which consults for green pigmentation and pain in the right thumbnail for 1 week long. Physical exploration: green discoloration and distal onycholysis, peripheral erythema and deep pain on the nail and paronychia palpation. No evidence of exudate.

Clinical diagnosis: Nail infection by *Pseudomonas aeruginosa* confirmed by the microbiological nail culture.

Treatment: ciprofloxacin 500mg /12h oral administration and topical treatment with acetic acid 2% solution for 14 days, with disappearance of pain and normalization of the nail color.

Discussion.

Green Nail Syndrome (GNS) is caused by a bacterial infection with *Pseudomonas aeruginosa*: a Gram negative bacillus which flourishes in wet environments and is enhanced by repetitive contact with water and cleansing products, particularly in abnormal nails. Housewives, dishwashers, cooks, and health care personnel may be more likely to have GNS. Also, it has been associated with the use of acrylic nails. It frequently is a complication of

onycholysis and chronicle paronychia. The green nail pigmentation is given by the presence of 2 fluorescent pigments called pyocyanin and pyoverdin produces by *Pseudomonas aeruginosa*. It is usually not painful, confined to one or two nails and could be accompanied by adjacent skin erythema. The diagnosis is clinical. However, if there is doubt, a nail sample can be taken for culture. Treatment consists of cutting the detached portion of nail and keeping nails dry. Topical treatment with acetic acid 1-2%, 3-4 times daily is effective in 2-3 weeks. Other topical therapies are neomycin, polymyxin B or tobramycin. An oral antibiotic, such as ciprofloxacin, is often prescribed and shorten the healing time. Despite the correct treatment, the green pyocyanin pigmentation could persist for months. The clinical appearance of GNS makes it an easy diagnosis for a general practitioner and avoids unnecessary referrals.

Keywords: *Pseudomonas aeruginosa*, Onycholysis, Green Nail Pigmentation.

Tolosa-Hunt syndrome versus Nocardia

M. Carmen Ruiz Martín, Andres A. Martínez Arias, Purificación Jordana Ferrando, Laura Pons Pons, Jesús García Palacios, Andrés R. Parra Rojas

ABS Indianes.Montcada i Reixac.Barcelona. Spain.

INTRODUCTION:

Tolosa-Hunt syndrome (THS) incidence is 1 per million.No sex or age predilection.

Etiology is unknown, although it involved a granulomatous inflammation of carotid sinus that causes pressure on the structures of the cavernous sinus (cranial nerves III, IV, V, VI).

It ´s clinically characterized by periorbital or hemicranial pain with ophthalmoplegia and good response to corticosteroid treatment.

Diagnosis by exclusion (neoplastic, vascular, traumatic, metabolic, endocrine, infections and autoimmune diseases).

The Nocardia is a saprophytic organism that infects by air the central nervous system and other organs opportunistically and asymptomatic with an indefinite stay. Faced a deficit of lymphocytes T, crosses the blood-brain barrier without altering it, may be in the form of granulomas or abscesses asymptomatic. In immunosuppression´ s states cause pulmonary, neurological or systemic symptoms

CASE CLINIC: 57 year old man, with obesity, hypertension and dyslipidemia.Two weeks ago, has right retroocular headache and horizontal diplopia,unresponsive to conventional analgesia.

After discarding neoplastic, vascular, traumatic, metabolic, endocrine, infections and autoimmune diseases.

Magnetic resonance detected discrete asymmetry between both cavernous sinuses and slight diffuse thickening at right. THS diagnosed, clinical improvement occurred with corticosteroid treatment.

Two months later, starts diarrhea, pleuritic costal pain and fever. Radiologically shows middle lobe pulmonary condensation, doesn´ t improve clinically with levofloxacin and later with amoxicillin / clavulanic acid.

Thoracic CT shows involvement of upper and middle right lobes pulmonary with central cavitation and right pleura. PAFF with infectious features and cultere insulated Nocardia.

Trimethoprim / sulfamethoxazole is initiated with clinical and radiological improvement.

CONCLUSIONS: Since the THS, most of the time, is clinical presented only as a painful ophthalmoplegia, although its incidence is low and the etiology is remains unknown; clinicians should know, because mostly it ´s a diagnosis of exclusion and can sometimes be involved primary or secondary opportunistic infections.

Keywords: Tolosa-hunt syndrome. Tolosa-hunt syndrome AND Nocardia. Nocardia.

A-One or more episodes of unilateral orbital pain persisting for weeks without treatment
B-Paralysis of one or more of the oculomotor nerves (III, IV or VI) and / or demonstration of granuloma in brain MRI or biopsy.
C- The ophthalmoparesis coincides with the onset of pain or follows it in less than two weeks.
D- The pain and the paralysis resolved within 72 hours when a correct corticosteroid treatment is started.
E Exclusion of other causes through appropriate investigations.

Comparative study of calcific longus colli tendinitis in the past year at our hospital

Mikio Hayashi¹, Masanari Shiigai²

¹Department of General Medicine and Primary Care, Tsukuba Medical Center Hospital, Ibaraki, Japan

²Department of Radiology, Tsukuba Medical Center Hospital, Ibaraki, Japan

[Background and Aim]

Calcific longus colli tendinitis is a non-infectious, inflammatory myositis, presenting with acute cervical pain and odynophagia. Because fever sometimes accompanies this disorder, differentiation from a retropharyngeal abscess and vertebral osteomyelitis is necessary. From reviewing cases with a confirmed diagnosis of calcific longus colli tendinitis, we surmised that there is a need to clearly articulate the medical care environment and the circumstances leading to the diagnosis, not just the clinical signs and clinical course.

[Method]

We reviewed 5 cases of calcific longus colli tendinitis diagnosed at our hospital within the past year, and performed a comparative study about the medical care environment, clinical signs, circumstances leading to diagnosis, and clinical course.

[Results]

Concerning the medical care environment, there were more visits to the emergency outpatient department than the general outpatient department. Concerning clinical signs, cervical pain and odynophagia were observed in all cases; cases with fever were also noted. However, to differentiate from retropharyngeal abscess and vertebral

osteomyelitis, imaging was performed in all cases, and the diagnosis was mostly based on indications from the radiologist. Concerning the clinical course, improvement of the condition was seen after about 1 week in all cases.

[Conclusions]

In calcific longus colli tendinitis, the symptoms develop suddenly. In many cases, we observed that the time of the first patient presentation was not a general outpatient visit but an emergency outpatient visit. When cervical pain and odynophagia were the main complaints during the outpatient visit, calcific longus colli tendinitis was inconclusively diagnosed in many cases; follow-up was conducted for those cases. Primary care physicians should consider calcific longus colli tendinitis in the differential diagnosis when the main patient complaint is acute cervical pain and odynophagia.

Keywords: calcific longus colli tendinitis, cervical pain, odynophagia

Characteristics of the Patients

Case 1 : Age - 31 / Sex - Male / Clinical Signs - cervical pain , odynophagia , fever
Medical Care Environment - emergency outpatient visit
Time between presentation and diagnosis - 2 days (hospitalization)

Case 2 : Age - 62 / Sex - Female / Clinical Signs - cervical pain , odynophagia , fever
Medical Care Environment - emergency outpatient visit
Time between presentation and diagnosis - 3 days (no hospitalization)

Case 3 : Age - 43 / Sex - Female / Clinical Signs - cervical pain , odynophagia
Medical Care Environment - general outpatient visit
Time between presentation and diagnosis - 1 day (no hospitalization)

Case 4 : Age - 45 / Sex - Male / Clinical Signs - cervical pain , odynophagia
Medical Care Environment - emergency outpatient visit
Time between presentation and diagnosis - 3 days (no hospitalization)

Case 5 : Age - 50 / Sex - Male / Clinical Signs - cervical pain , odynophagia , fever
Medical Care Environment - emergency outpatient visit
Time between presentation and diagnosis - 3 days (no hospitalization)

Creatine kinase elevation in a hypercholesterolemic patient. It's not always the statins' fault!

Madalina Beatrice Morna

Catalan Institute of Health, Primary Health Care Center CAP Viladecans, Barcelona, Spain

We present the case of a 65 years old woman, dyslipemic treated with simvastatine, which in a routine analyse has found creatine kinase(CK) elevation 665U/L, 4x normal value. No myalgias or muscle weakness. Statin is removed, but CK elevation persists. For one month long she presents facial rash. Physical exploration: heliotrope erythema, Gottron`s papules on the hands and difficulty on getting up from squatting. Suspected diagnosis: dermatomyositis(DM), confirmed by positive blood analysis for Nuclear Antibodys, Rheumatoid Factor and Mi2 Antibodies(associated to DM). Electromyogram reveals muscle fibres affectation. Cutaneous and muscle biopsy are inconclusive. Tumour tracking and marker tests CA125, CA19.9 without evidence of neoplasia. Treatment initiated with high dose of prednisone 80 mg/day and ulterior progressive reduction till 30mg with CK normalization.

DISCUSSION: Dermatomyositis is an idiopathic inflammatory myopathy characterized by progressive symmetrical proximal muscle weakness, characteristic skin lesions (heliotrope erythema, Gottron`s papules) and specific autoantibodies. Diagnosis is based on compatible cutaneous findings, elevation of muscle enzymes (creatine kinase, aldolase, lactic dehydrogenase, or alanine aminotransferase) positivity of myositis-specific autoantibodies, electromyography, and muscle and skin biopsy. Magnetic Resonance Imaging completes the study if other tests are inconclusive. Patients may have skin disease, without clinically apparent muscle injury, but this disorder is a

systemic process with frequent manifestations in gastrointestinal tract and pulmonary system and is associated with underlying malignancy in a 30%, especially in the first 3 years of diagnosis. Therefore, all patients with skin lesions need appropriate evaluation for muscle disease, esophageal dysfunction, cardiopulmonary disease, and potential internal malignancy.

Therapy includes photoprotection, topical and systemic corticosteroids and immunomodulatory agents (methotrexate, azathioprine, ciclosporina), although biologics are frequently prescribed.

CONCLUSION: Although DM is a rare disease, the suspected diagnosis is clinical and the general practitioner has to maintain alert to the clinical features.

Keywords: Dermatomyositis, inflammatory myopathy, heliotrope erythema.
